Address: **Operational Base** + offset (0x0428)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	lpr_credit_cnt_num_32_47 The sum of LPR credits which is within the range of 32 and 47(including 32 and 47).

DDRMON_LPR_CREDIT_CNT_NUM_48_63

Address: **Operational Base** + offset (0x042C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	lpr_credit_cnt_num_48_63 The sum of LPR credits which is within the range of 48 and 63(including 48 and 63).

DDRMON_LPR_CREDIT_CNT_NUM_FULL

Address: **Operational Base** + offset (0x0430)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	lpr_credit_cnt_num_full Everytime the LPR credit is full(It means there are no LPR commands pending in DDR controller's read CAM), this counter will increase by 1'b1. The total LPR credit number is equal to DDR controller's register SCHED0.lpr_num_entries+1.

DDRMON_HPR_CREDIT_CNT_NUM_0_15

Address: **Operational Base** + offset (0x0440)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	hpr_credit_cnt_num_0_15 The sum of HPR credits which is within the range of 0 and 15(including 0 and 15).

DDRMON_HPR_CREDIT_CNT_NUM_16_31

Address: **Operational Base** + offset (0x0444)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	hpr_credit_cnt_num_16_31 The sum of HPR credits which is within the range of 16 and 31(including 16 and 31).

DDRMON_HPR_CREDIT_CNT_NUM_32_47

Address: **Operational Base** + offset (0x0448)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	hpr_credit_cnt_num_32_47 The sum of HPR credits which is within the range of 32 and 47(including 32 and 47).

DDRMON_HPR_CREDIT_CNT_NUM_48_63

Address: **Operational Base** + offset (0x044C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	hpr_credit_cnt_num_48_63 The sum of HPR credits which is within the range of 48 and 63(including 48 and 63).

DDRMON_HPR_CREDIT_CNT_NUM_FULL

Address: **Operational Base** + offset (0x0450)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	hpr_credit_cnt_num_full Everytime the HPR credit is full(It means there are no HPR commands pending in DDR controller's read CAM), this counter will increase by 1'b1. The total HPR credit number is equal to DDR controller's register 64-(SCHED0.lpr_num_entries+1).

DDRMON_WR_CREDIT_CNT_NUM_0_15

Address: **Operational Base** + offset (0x0460)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	wr_credit_cnt_num_0_15 The sum of WR credits which is within the range of 0 and 15(including 0 and 15).

DDRMON_WR_CREDIT_CNT_NUM_16_31

Address: **Operational Base** + offset (0x0464)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	wr_credit_cnt_num_16_31 The sum of WR credits which is within the range of 16 and 31(including 16 and 31).

DDRMON_WR_CREDIT_CNT_NUM_32_47

Address: **Operational Base** + offset (0x0468)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	wr_credit_cnt_num_32_47 The sum of WR credits which is within the range of 32 and 47(including 32 and 47).

DDRMON_WR_CREDIT_CNT_NUM_48_63

Address: **Operational Base** + offset (0x046C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	wr_credit_cnt_num_48_63 The sum of WR credits which is within the range of 48 and 63(including 48 and 63).

DDRMON_WR_CREDIT_CNT_NUM_FULL

Address: **Operational Base** + offset (0x0470)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	wr_credit_cnt_num_full Everytime the WR credit is full(It means there are no HPR commands pending in DDR controller's read CAM), this counter will increase by 1'b1. The total WR credit number is equal to 64.

7.5 Interface Description

DDR IOs from DDRPHY are listed as following table.

Table 7-1 DDR Channel 0 IO description

Pad Name	Description
LP4_CLKP_A/LP4x_CLKP_A/LP5_CLKP_A	Positive differential clock
LP4_CLKN_A/LP4x_CLKN_A/LP5_CLKN_A	Negative differential clock
LP4_RESET/LP4x_RESET/LP5_RESET	When asserted LOW, this signal resets the die.
LP4_CKE0_A/LP4x_CKE0_A/LP5_CSN0_A	Active-high clock enable signal for rank0 of LPDDR4/4X and acts as chip select signal for rank0 of LPDDR5.
LP4_CKE1_A/LP4x_CKE1_A/LP5_CSN1_A	Active-high clock enable signal for rank1 of LPDDR4/4X and acts as chip select signal for rank1 of LPDDR5.
LP4_CSN0_A/LP4X_CSN0_A	Chip select signal for rank0. Only used

Copyright © 2024 Rockchip Electronics Co., Ltd.

	for LPDDR4/4X.
LP4_CSN1_A/LP4X_CSN1_A	Chip select signal for rank1. Only used for LPDDR4/4X
LP4_A0_A/LP4x_A0_A/LP5_A0_A	Command and address signal bit0 for LPDDR4/4X and LPDDR5
LP4_A1_A/LP4x_A1_A/LP5_A1_A	Command and address signal bit1 for LPDDR4/4X and LPDDR5
LP4_A2_A/LP4x_A2_A/LP5_A2_A	Command and address signal bit2 for LPDDR4/4X and LPDDR5
LP4_A3_A/LP4x_A3_A/LP5_A3_A	Command and address signal bit3 for LPDDR4/4X and LPDDR5
LP4_A4_A/LP4x_A4_A/LP5_A4_A	Command and address signal bit4 for LPDDR4/4X and LPDDR5
LP4_A5_A/LP4x_A5_A/LP5_A5_A	Command and address signal bit5 for LPDDR4/4X and LPDDR5
LP5_A6_A	Command and address signal bit6 for LPDDR5,not used for LPDDR4/4X
LP4_DQS0P_A/LP4x_DQS0P_A/LP5_RDQS0P_A	Positive DQS for DQ[7:0]
LP4_DQS0N_A/LP4x_DQS0N_A/LP5_RDQS0N_A	Negative DQS for DQ[7:0]
LP4_DQS1P_A/LP4x_DQS1P_A/LP5_RDQS1P_A	Positive DQS for DQ[15:8]
LP4_DQS1N_A/LP4x_DQS1N_A/LP5_RDQS1N_A	Negative DQS for DQ[15:8]
LP5_WCK0P_A	Positive differential clock used for WRITE data capture and READ data output for LPDDR5. It corresponds to DQ[7:0].
LP5_WCK0N_A	Negative differential clock used for WRITE data capture and READ data output for LPDDR5. It corresponds to DQ[7:0].
LP5_WCK1P_A	Positive differential clock used for WRITE data capture and READ data output for LPDDR5. It corresponds to DQ[15:8].
LP5_WCK1N_A	Negative differential clock used for WRITE data capture and READ data output for LPDDR5. It corresponds to DQ[15:8].
LP4_DMI0_A/LP4x_DMI0_A/LP5_DMI0_A	This signal achieves multiple function such as Data Mask (DM) and Data Bus Inversion (DBI) by setting the Mode Register and it is a bi-directional signal and each byte of data has a DMI signal. This signal corresponds to DQ[7:0].
LP4_DMI1_A/LP4x_DMI1_A/LP5_DMI1_A	This signal corresponds to DQ[15:8].
LP4_DQi_A/LP4x_DQi_A/LP5_DQi_A (i=0~15)	Bidirectional data bus
ZQ_A	Used to calibrate the output drive strength and the termination resistance as calibration reference.

Table 7-2 DDR Channel 1 IO description

Pad Name	Description
LP4_CLKP_B/LP4x_CLKP_B/LP5_CLKP_B	Positive differential clock
LP4_CLKN_B/LP4x_CLKN_B/LP5_CLKN_B	Negative differential clock
LP4_CKE0_B/LP4x_CKE0_B/LP5_CSN0_B	Active-high clock enable signal for rank0 of LPDDR4/4X and acts as chip select signal for rank0 of LPDDR5.
LP4_CKE1_B/LP4x_CKE1_B/LP5_CSN1_B	Active-high clock enable signal for

Copyright © 2024 Rockchip Electronics Co., Ltd.

	rank1 of LPDDR4/4X and acts as chip select signal for rank1 of LPDDR5.
LP4_CSN0_B/LP4X_CSN0_B	Chip select signal for rank0. Only used for LPDDR4/4X.
LP4_CSN1_B/LP4X_CSN1_B	Chip select signal for rank1. Only used for LPDDR4/4X
LP4_A0_B/LP4x_A0_B/LP5_A0_B	Command and address signal bit0 for LPDDR4/4X and LPDDR5
LP4_A1_B/LP4x_A1_B/LP5_A1_B	Command and address signal bit1 for LPDDR4/4X and LPDDR5
LP4_A2_B/LP4x_A2_B/LP5_A2_B	Command and address signal bit2 for LPDDR4/4X and LPDDR5
LP4_A3_B/LP4x_A3_B/LP5_A3_B	Command and address signal bit3 for LPDDR4/4X and LPDDR5
LP4_A4_B/LP4x_A4_B/LP5_A4_B	Command and address signal bit4 for LPDDR4/4X and LPDDR5
LP4_A5_B/LP4x_A5_B/LP5_A5_B	Command and address signal bit5 for LPDDR4/4X and LPDDR5
LP5_A6_B	Command and address signal bit6 for LPDDR5,not used for LPDDR4/4X
LP4_DQS0P_B/LP4x_DQS0P_B/LP5_RDQS0P_B	Positive DQS for DQ[7:0]
LP4_DQS0N_B/LP4x_DQS0N_B/LP5_RDQS0N_B	Negative DQS for DQ[7:0]
LP4_DQS1P_B/LP4x_DQS1P_B/LP5_RDQS1P_B	Positive DQS for DQ[15:8]
LP4_DQS1N_B/LP4x_DQS1N_B/LP5_RDQS1N_B	Negative DQS for DQ[15:8]
LP5_WCK0P_B	Positive differential clock used for WRITE data capture and READ data output for LPDDR5. It corresponds to DQ[7:0].
LP5_WCK0N_B	Negative differential clock used for WRITE data capture and READ data output for LPDDR5. It corresponds to DQ[7:0].
LP5_WCK1P_B	Positive differential clock used for WRITE data capture and READ data output for LPDDR5. It corresponds to DQ[15:8].
LP5_WCK1N_B	Negative differential clock used for WRITE data capture and READ data output for LPDDR5. It corresponds to DQ[15:8].
LP4_DMI0_B/LP4x_DMI0_B/LP5_DMI0_B	This signal achieves multiple function such as Data Mask (DM) and Data Bus Inversion (DBI) by setting the Mode Register and it is a bi-directional signal and each byte of data has a DMI signal. This signal corresponds to DQ[7:0].
LP4_DMI1_B/LP4x_DMI1_B/LP5_DMI1_B	This signal corresponds to DQ[15:8].
LP4_DQi_B/LP4x_DQi_B/LP5_DQi_B (i=0~15)	Bidirectional data bus
ZQ_B	Used to calibrate the output drive strength and the termination resistance as calibration reference.

7.6 Application Notes

7.6.1 Quasi Dynamic Registers of DDRCTL

In addition to the dynamic registers, there are 4 categories of registers can be written after

Copyright © 2024 Rockchip Electronics Co., Ltd.

reset. These 4 kinds of registers are divided into group 1, group 2, group 3 and group 4. Each category requires specific conditions for the registers to be programmed. Once the programming conditions are met, DDRCTL_SWCTL.sw_done register must be programmed to 1'b0 to enable the software programming. Once the programming is completed, DDRCTL_SWCTL.sw_done must be set to 1'b1 and DDRCTL_SWSTAT.sw_done_ack must be read as 1'b1. This is to ensure that quasi dynamic registers are propagated correctly to the destination clocks. The protocol flowchart is shown below.

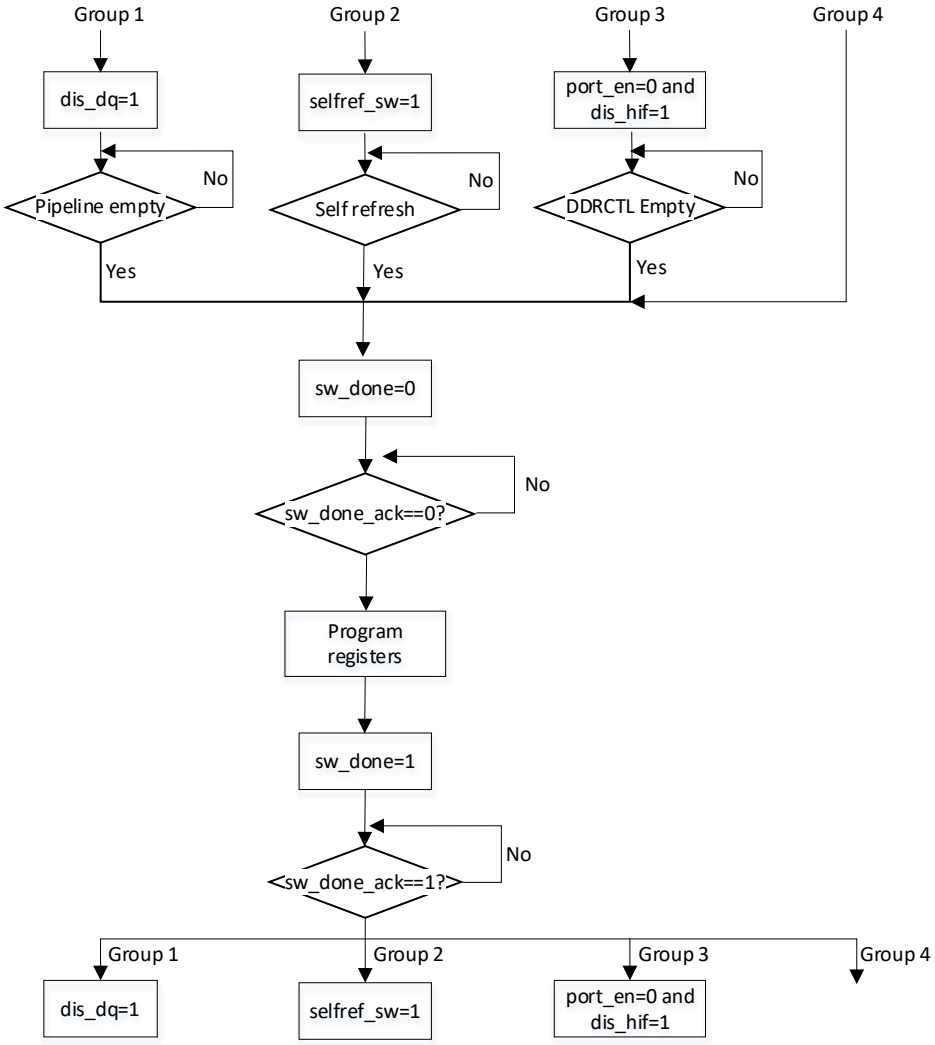

Fig. 7-5 Quasi dynamic registers program flow of DDRCTL

Group 1 refers to registers that can be written when no read/write traffic is present at the DFI. By setting DDRCTL_OPCTRL1.dis_dq register and polling DDRCTL_OPCTRLCAM.wr_data_pipeline_empty and DDRCTL_OPCTRLCAM.rd_data_pipeline_empty1, it is possible to prevent any read or write traffic from being sent on the DFI. In this mode, it is safe to write to the group 1 registers. Re-enable the traffic by writing DDRCTL_OPCTRL1.dis_dq to 1'b0.

Group 2 refers to registers that can be written in self-refresh mode. When the DDRCTL has entered self-refresh mode through software (DDRCTL_PWRCTL.selfref_sw), the DFI bus is idle until software exits self-refresh. In this mode, it is safe to write the group 2 registers. Re-enable the traffic by writing DDRCTL_PWRCTL.selfref_sw to 1'b0 and polling DDRCTL_STAT.operating_mode.

Group 3 refers to registers that can be written when controller is empty. For multi-port configurations, DDRCTL_PORTi_PCTRL.port_en(i=0~4) is used to enable or disable the input traffic per port. The controller idleness can be polled first from DDRCTL_PORTi_PSTAT register (wr_port_busy_n and rd_port_busy_n bit fields) and should read as DDRCTL_PORTi_PSTAT==32'b0 (not busy). DDRCTL_OPCTRL1.dis_hif is used to enable or disable the input traffic to the controller. Then, DDRCTL CAM/pipeline empty status must be polled ((DDRCTL_OPCTRLCAM.dbg_wr_q_empty== 1'b1) &&

Copyright © 2024 Rockchip Electronics Co., Ltd.

(DDRCTL_OPCTRLCAM.dbg_rd_q_empty== 1'b1) &&
(DDRCTL_OPCTRLCAM.wr_data_pipeline_empty== 1'b1) &&
(DDRCTL_OPCTRLCAM.rd_data_pipeline_empty==1'b1)). In this mode, it is safe to write the group 3 registers.
Group 4 refers to registers that can be written depending on DDRCTL_MSTR2.target_frequency. It is safe to write the registers in the other blocks other than the one is working. For example, it is safe to write registers in REGB_FREQ0, REGB_FREQ2 and REGB_FREQ3 when DDRCTL_MSTR2.target_frequency is equal to '1'.

7.6.2 2-channel Interleaving LPDDR4/4X Initialization

Following steps are for 2-channel interleaving LPDDR4/4X initialization.
1. Power up DDRPHY core supply (DDRPHY_DVDD), power up CKE power (DDRPHY_CKE_VDDQ) and then power up IO supply (DDRPHY_CK_VDDQ and DDRPHY_VDDQ).
2. Keep DDRPLL (D0APLL and D1APLL) at default configuration to output 24MHz frequency. Configure DDRPLL (D0BPLL and D1BPLL) to lock at target operation frequency. Now by default the input clk_phy2x of DDRPHY is 24MHz. Make sure that PCLK frequency of DDRPHY is not higher than clk_dfi which is generated from clk_phy2x.
3. De-assert PRESETn of DDRPHY and present of DDRCTL.
4. De-assert RESETn of DDRPHY. Wait for at least 10 cycles of clk_phy2x.
5. Set DDR_GRF_CHA/CHB_PHY_CON0[3](CHA/CHB registers are used to control DDR channel 0/1 respectively) and DDR_GRF_CHA/CHB_PHY_CON1[3] of DDR_GRF to 1'b1 to enable DDRPHY2XCLKGATE_ENABLE of each DDRPHY. Wait for at least 10 cycles of clk_phy2x.
6. De-assert div_rst_n of DDRPHY. Wait for at least 10 cycles of clk_phy2x.
7. Assert core_ddrc_rstn and aresetn_i(i=0~4)of DDRCTL.
8. De-assert rst_n of DDRPHY. Make sure that rst_n is released at 24MHz low frequency.
9. Set DDR_GRF_CHA/CHB_PHY_CON0[3] and DDR_GRF_CHA/CHB_PHY_CON1[3] of DDR_GRF to 1'b0 to disable DDRPHY2XCLKGATE_ENABLE of each DDRPHY.
10. Assert div_rst_n of DDRPHY.
11. Set DDRPHY registers to select memory type and clock mode.
    - DDRPHY_GNR_CON0.ctrl_ddr_mode='h0
    - DDRPHY_CLKMODE_CON.ctrl_phy_mode='h1
    - DDRPHY_CLKMODE_CON.ctrl_phy_clk_2x='h1
12. De-assert div_rst_n of DDRPHY.
13. Executes step 5 again to enable the output clk_dfi of DDRPHY. Clk_dfi is used as the source clock of DDRCTL. It is connected to the core_ddrc_core_clk, aclk_i(i=0~4) and bsm_clk of DDRCTL.
14. De-assert presetn of DDRCTL.
15. Set DDRCTL registers.
16. De-assert core_ddrc_rstn and aresetn_i(i=0~4) of DDRCTL.
17. Disable auto-refreshes, self-refresh, power down and assertion of dfi_dram_clk_disable by setting DDRCTL_RFSHCTL0.dis_auto_refresh = 1, DDRCTL_PWRCTL.powerdown_en = 0 and DDRCTL_PWRCTL.selfref_en = 0, DDRCTL_PWRTL.en_dfi_dram_clk_disable = 0.
18. Set DDRCTL_SWCTL.sw_done to 1'b0.
19. Set DDRCTL_DFIMISC.dfi_init_complete_en to 1'b0.
20. Set DDRCTL_SWCTL.sw_done to 1'b1.
21. Set DDRCTL_PORTi_PCTRL.port_en(i=0~4) to 1'b1 to enable AXI port 0~4 of DDRCTL.
22. Begin to set DDRPHY registers. Such as read latency, write latency and burst length and so on.
23. Apply DDRPHY IO settings before ZQ calibration.
24. Start DFI initialization
    - Set DDRPHY_MDLL_CON0.ctrl_dll_on=1'b0
    - DDRCTL should assert dfi_init_start from low to high
    - DDRCTL should wait dfi_init_complete change from low to high
25. Set DDRCTL_SWCTL.sw_done to 1'b0. Set DDRCTL_DFIMISC.dfi_init_start to 1'b0 and DDRCTL_DFIMISC.dfi_init_complete_en to 1'b1. Set DDRCTL_SWCTL.sw_done to 1'b1.
26. Wait for DDRCTL to move to normal operating mode by monitoring

Copyright © 2024 Rockchip Electronics Co., Ltd.

DDRCTL_STAT.operating_mode register.
27. DDRPHY vref related registers settings without vref training.
28. DDRPHY ODT related registers settings.
29. Start DDRPHY ZQ calibration.
    - Enable DDRPHY_ZQ_CON0.zq_clk_div_en
    - Enable DDRPHY_ZQ_CON0.zq_manual_str
    - Wait until DDRPHY_ZQ_CON1.zq_done is enabled
    - Disable DDRPHY_ZQ_CON0.zq_manual_str
    - Disable DDRPHY_ZQ_CON0.zq_clk_div_en
30. Frequency change to the target operation speed. Using frequency change protocol via MC-PHY handshake.
    - Set DDRCTL_SWCTL.sw_done to 1'b0.
    - Set DDRCTL_DFIMISC.dfi_init_complete_en to 1'b0.
    - Set DDRCTL_DFIMISC.dfi_init_start to 1'b1. Set DDRCTL_SWCTL.sw_done to 1'b1.
    - Poll DDRCTL_DFISTAT.dfi_init_complete=1'b0.
    - Programming DDR_GRF_CHA/CHB_PHY_CON0[3] and DDR_GRF_CHA/CHB_PHY_CON1[3] of DDR_GRF to 1'b0 to disable DDRPHY2XCLKGATE_ENABLE of each DDRPHY.
    - Assert div_rst_n of DDRPHY if LPDDR5 is used. If LP4/4X is used, don't assert div_rst_n.
    - Change clk_phy2x frequency of DDRPHY channel 0 by setting DDR0CRU_CLKSEL_CON00[0] to 1'b1 to select D0BPLL, set DDR1CRU_CLKSEL_CON00[0] to 1'b1 to select D1BPLL output clock as DDRPHY channel 1 driving clock.
    - Change PCLK of DDRPHY to high frequency such as 200MHz.
    - De-assert div_rst_n of DDRPHY if LPDDR5 is used. If LP4/4X is used, skip this flow.
    - Set DDR_GRF_CHA/CHB_PHY_CON0[3] and DDR_GRF_CHA/CHB_PHY_CON1[3] of DDR_GRF to 1'b1 to enable DDRPHY2XCLKGATE_ENABLE of each DDRPHY.
    - Set DDRCTL_SWCTL.sw_done to 1'b0. Set DDRCTL_DFIMISC.dfi_init_start to 1'b0. Set DDRCTL_SWCTL.sw_done to 1'b1.
    - Poll DDRCTL_DFISTAT.dfi_init_complete=1'b1.
    - Set DDRCTL_SWCTL.sw_done to 1'b0.
    - Set DDRCTL_DFIMISC.dfi_init_complete_en to 1'b1 to indicate to the controller that the DDRPHY has finished frequency change.
    - Set DDRCTL_SWCTL.sw_done to 1'b1.
31. Set GRF_CHA/CHB_DDRPHY_CON0[5] and GRF_CHA/CHB_DDRPHY_CON1[5] to 1'b1, then set GRF_CHA/CHB_DDRPHY_CON0[4] and GRF_CHA/CHB_DDRPHY_CON1[4] to 1'b1 to select DDRCTL's dfi_init_complete driven by DDR_GRF. This step is necessary because the following DDRPHY_MDLL_CON0.ctrl_dll_on=1 will pull dfi_init_complete low, which will cause DDRCTL abnormal.
32. Turn on DDRPHY master DLL by setting DDRPHY_MDLL_CON0.ctrl_dll_on=1'b1.
33. Start DDRPHY master DLL locking by enable DDRPHY_MDLL_CON0.ctrl_start
    - Set DDRPHY_MDLL_CON0.ctrl_start to 1'b0.
    - Set DDRPHY_MDLL_CON0.ctrl_start to 1'b1.
    - Wait until DDRPHY_MDLL_CON1.ctrl_locked=1'b1.
34. Set GRF_CHA/CHB_DDRPHY_CON0[4] and GRF_CHA/CHB_DDRPHY_CON1[4] back to 1'b0.
35. DDRPHY SFR settings. Set DDRPHY_LP_CON0.ctrl_scheduler_en to 1'b1 and other registers if necessary.
36. Start DDRPHY initial read and write training. Please refer to the following section for LPDDR4/4X training procedure.
37. DDRPHY SFR settings that should be set after training such as following registers and so on.
    - Set DDRPHY_MDLL_CON0.clkm_cg_en_sw to 1'b0.
    - Set DDRPHY_CAL_CON0.cal_vtc_en to 1'b1.
    - Set DDRPHY_CAL_CON5.wrtrn_cycle_mode=0 during normal operation.

Copyright © 2024 Rockchip Electronics Co., Ltd.

7.6.3 2-channel Interleaving LPDDR5 Initialization

Following steps are for 2-channel interleaving LPDDR5 initialization.

1. Power up DDRPHY core supply (DDRPHY_DVDD), power up CKE power (DDRPHY_CKE_VDDQ) and then power up IO supply (DDRPHY_CK_VDDQ and DDRPHY_VDDQ).
2. Keep DDRPLL (D0APLL and D1APLL) at default configuration to output 24MHz frequency. Configure DDRPLL (D0BPLL and D1BPLL) to lock at target operation frequency. Now by default the input clk_phy2x of DDRPHY is 24MHz. Make sure that PCLK frequency of DDRPHY is not higher than clk_dfi which is generated from clk_phy2x.
3. De-assert PRESETn of DDRPHY and present of DDRCTL.
4. De-assert RESETn of DDRPHY. Wait for at least 10 cycles of clk_phy2x.
5. Set DDR_GRF_CHA/CHB_PHY_CON0[3] and DDR_GRF_CHA/CHB_PHY_CON1[3] of DDR_GRF to 1'b1 to enable DDRPHY2XCLKGATE_ENABLE of each DDRPHY. Wait for at least 10 cycles of clk_phy2x.
6. De-assert div_rst_n of DDRPHY. Wait for at least 10 cycles of clk_phy2x.
7. Assert core_ddrc_rstn and aresetn_i(i=0~4)of DDRCTL.
8. De-assert rst_n of DDRPHY. Make sure that rst_n is released at 24MHz low frequency.
9. Set DDR_GRF_CHA/CHB_PHY_CON0[3] and DDR_GRF_CHA/CHB_PHY_CON1[3] of DDR_GRF to 1'b0 to disable DDRPHY2XCLKGATE_ENABLE of each DDRPHY.
10. Assert div_rst_n of DDRPHY.
11. Set DDRPHY registers to select memory type and clock mode. Following configuration are for 1:1:4 mode (CLK_DFI: CK: WCK).
    - DDRPHY_GNR_CON0.ctrl_ddr_mode='h2
    - DDRPHY_CLKMODE_CON.ctrl_phy_mode='h4
    - DDRPHY_CLKMODE_CON.ctrl_phy_clk_2x='h1

    If CLK_DFI: CK: WCK is 1:1:2, following configuration should be followed.
    - DDRPHY_GNR_CON0.ctrl_ddr_mode='h2
    - DDRPHY_CLKMODE_CON.ctrl_phy_mode='h2
    - DDRPHY_CLKMODE_CON.ctrl_phy_clk_2x='h1
12. De-assert div_rst_n of DDRPHY.
13. Excutes step 5 again to enable the output clk_dfi of DDRPHY. Clk_dfi is used as the source clock of DDRCTL. It is connected to the core_ddrc_core_clk, aclk_i(i=0~4) and bsm_clk of DDRCTL.
14. De-assert presetn of DDRCTL.
15. Set DDRCTL registers.
16. De-assert core_ddrc_rstn and aresetn_i(i=0~4) of DDRCTL.
17. Disable auto-refreshes, self-refresh, power down and assertion of dfi_dram_clk_disable by setting DDRCTL_RFSHCTL0.dis_auto_refresh = 1, DDRCTL_PWRCTL.powerdown_en = 0 and DDRCTL_PWRCTL.selfref_en = 0, DDRCTL_PWRTL.en_dfi_dram_clk_disable = 0.
18. Set DDRCTL_SWCTL.sw_done to 1'b0.
19. Set DDRCTL_DFIMISC.dfi_init_complete_en to 1'b0.
20. Set DDRCTL_SWCTL.sw_done to 1'b1.
21. Set DDRCTL_PORTi_PCTRL.port_en(i=0~4) to 1'b1 to enable AXI port 0~4 of DDRCTL.
22. Begin to set DDRPHY registers. Such as read latency, write latency and burst length and so on.
23. Apply DDRPHY IO settings before ZQ calibration.
24. DDRPHY DLL lock value force and update for low frequency initialization under 100MHz.
    - Set DDRPHY_MDLL_CON0.ctrl_force=11'h2ef.
    - Set DDRPHY_MDLL_CON0.ctrl_dll_on=1'b0.
25. Start DFI initialization
    - Set DDRPHY_MDLL_CON0.ctrl_dll_on=1'b0
    - DDRCTL should assert dfi_init_start from low to high
    - DDRCTL should wait dfi_init_complete change from low to high
26. Set DDRCTL_MRCTRL0=32'h8 to enable software intervention allowed before SDRAM automatic initialization.
27. Set DDRCTL_SWCTL.sw_done to 1'b0. Set DDRCTL_DFIMISC.dfi_init_start to 1'b0 and DDRCTL_DFIMISC.dfi_init_complete_en to 1'b1. Set DDRCTL_SWCTL.sw_done to 1'b1.

Copyright © 2024 Rockchip Electronics Co., Ltd.

28. Delay an appropriate period of time according to the DDRCTL_INITTMG1.dram_rstn_x1024 to issue power down exit asynchronously by programming following registers.
Set DDR_GRF_CHA_CON2[7:0] and DDR_GRF_CHB_CON2[7:0] of DDR_GRF to 8'hff to toggle LPDDR5 chip select signal(CS) from 1'b0 to 1'b1.
Set DDR_GRF_CHA_CON2[7:0] and DDR_GRF_CHB_CON2[7:0] of DDR_GRF to 8'h00 to toggle LPDDR5 chip select signal(CS) from 1'b1 to 1'b0.
29. Start memory initialization by DDRCTL by sending MRW command.
30. Wait for DDRCTL to move to normal operating mode by monitoring DDRCTL_STAT.operating_mode register.
31. DDRPHY vref related registers settings without vref training.
32. DDRPHY ODT related registers settings.
33. Start DDRPHY ZQ calibration.
- Enable DDRPHY_ZQ_CON0.zq_clk_div_en
- Enable DDRPHY_ZQ_CON0.zq_manual_str
- Wait until DDRPHY_ZQ_CON1.zq_done is enabled
- Disable DDRPHY_ZQ_CON0.zq_manual_str
- Disable DDRPHY_ZQ_CON0.zq_clk_div_en

34. Frequency change to the target operation speed. Using frequency change protocol via MC-PHY handshake.
- Set DDRCTL_SWCTL.sw_done to 1'b0.
- Set DDRCTL_DFIMISC.dfi_init_complete_en to 1'b0.
- Set DDRCTL_DFIMISC.dfi_init_start to 1'b1. Set DDRCTL_SWCTL.sw_done to 1'b1.
- Poll DDRCTL_DFISTAT.dfi_init_complete=1'b0.
- Programming DDR_GRF_CHA/CHB_PHY_CON0[3] and DDR_GRF_CHA/CHB_PHY_CON1[3] of DDR_GRF to 1'b0 to disable DDRPHY2XCLKGATE_ENABLE of each DDRPHY.
- Assert div_rst_n of DDRPHY if LPDDR5 is used. If LP4/4X is used, don't assert div_rst_n.
- Change clk_phy2x frequency of DDRPHY channel 0 by setting DDR0CRU_CLKSEL_CON00[0] to 1'b1 to select D0BPLL, set DDR1CRU_CLKSEL_CON00[0] to 1'b1 to select D1BPLL output clock as DDRPHY channel 1 driving clock.
- Change PCLK of DDRPHY to high frequency such as 200MHz.
- De-assert div_rst_n of DDRPHY if LPDDR5 is used. If LP4/4X is used, skip this flow.
- Set DDR_GRF_CHA/CHB_PHY_CON0[3] and DDR_GRF_CHA/CHB_PHY_CON1[3] of DDR_GRF to 1'b1 to enable DDRPHY2XCLKGATE_ENABLE of each DDRPHY.
- Set DDRCTL_SWCTL.sw_done to 1'b0. Set DDRCTL_DFIMISC.dfi_init_start to 1'b0. Set DDRCTL_SWCTL.sw_done to 1'b1.
- Poll DDRCTL_DFISTAT.dfi_init_complete=1'b1.
- Set DDRCTL_SWCTL.sw_done to 1'b0.
- Set DDRCTL_DFIMISC.dfi_init_complete_en to 1'b1 to indicate to the controller that the DDRPHY has finished frequency change.
- Set DDRCTL_SWCTL.sw_done to 1'b1.

35. Set GRF_CHA/CHB_DDRPHY_CON0[5] and GRF_CHA/CHB_DDRPHY_CON1[5] to 1'b1, then set GRF_CHA/CHB_DDRPHY_CON0[4] and GRF_CHA/CHB_DDRPHY_CON1[4] to 1'b1 to select DDRCTL's dfi_init_complete driven by DDR_GRF. This step is necessary because the following DDRPHY_MDLL_CON0.ctrl_dll_on=1 will pull dfi_init_complete low, which will cause DDRCTL abnormal.
36. Turn on DDRPHY master DLL by setting DDRPHY_MDLL_CON0.ctrl_dll_on=1'b1.
37. Start DDRPHY master DLL locking by enable DDRPHY_MDLL_CON0.ctrl_start
- Set DDRPHY_MDLL_CON0.ctrl_start to 1'b0.
- Set DDRPHY_MDLL_CON0.ctrl_start to 1'b1.
- Wait until DDRPHY_MDLL_CON1.ctrl_locked=1'b1.

38. Set GRF_CHA/CHB_DDRPHY_CON0[4] and GRF_CHA/CHB_DDRPHY_CON1[4] back to 1'b0.
39. DDRPHY SFR settings.

Copyright © 2024 Rockchip Electronics Co., Ltd.

- Set DDRPHY_LP_CON0.wck_enable=1'b1.
- Set DDRPHY_LP_CON0.ctrl_scheduler_en=1'b1.
- Set DDRPHY_LP_CON0.ctrl_dqs_drv_off=1'b1 if write link ECC is disabled.
- Set DDRPHY_GNR_CON0.wdqs_oen_mode=1'b1.

40. Set DDRPHY wck_adj, rwck_adj, wckdur_adj, rwckdur_adj properly. Set gate/read settings properly.
41. Start DDRPHY initial training. Please refer to the following section for LPDDR5 training procedure.
42. Please set WCK_MODE_APB before memory normal operation.
If WCK always on mode is enabled, set
DDRPHY_WCK2CKSYNC_CON0.WCK_MODE_APB=2'b1 and
DDRPHY_SCHD_CMD_CON0.CAS_EN_APB=1'b0. If WCK always on mode is disabled, set
DDRPHY_WCK2CKSYNC_CON0.WCK_MODE_APB=2'b0 and
DDRPHY_SCHD_CMD_CON0.CAS_EN_APB=1'b1.

7.6.4 LPDDR4/4X Training Procedure

Please apply the following steps before memory initialization if training are required.
Controller should not assert dfi_ctrlupd_req during training.

- Settings before training
  - Set DDRPHY_OFFSETD_CON0.upd_mode=1'b0 for PHY-initiated update mode.
  - Write current frequency to DDRPHY_DVFS_CON.freq_train
  - Initial Vref setting.
  - Set DDRPHY_MDLL_CON0.clkm_cg_en_sw=1'b1 to freeze DLL lock value during training for stability.
- Command bus training
- On-Die Termination
- Apply one of the following DQS cleaning options.
  - Auto DQS clean mode
  - IO RCV Single-Ended mode
- Read DQ training
- Write DQ training
- Save the training result to read and save training registers for PHY power in/off scenario.
- Initial training at lower frequency if necessary.
- The PHY should start the periodic training to compensate DRAM voltage/temperature variation followed by periodic training guide.

7.6.4.1 LPDDR4/4X Command Bus Training

DDRPHY supports 2 command bus training modes for LPDDR4/4X. That is SW command bus training mode and HW command bus training mode.
Following steps are for SW command bus training mode.

- Change to low frequency (under 200MHz).
- Set DDRPHY_LP_CON0.ds_io_pd=1'b0.
- Apply DQS offset.
  - DDRPHY_CAL_CON3.wrlvl_sw_mode=1'b1.
  - DDRPHY_WR_LVL_CON0.ctrl_wrlvl*_code=ck_offset (ck_offset=91ps/tFS, tFS: finedelay).
  - Enable DDRPHY_OFFSETD_CON0.ctrl_resync.
  - Disable DDRPHY_OFFSETD_CON0.ctrl_resync.
  - DDRPHY_CAL_CON3.wrlvl_sw_mode=1'b0.
- Controller should configure memory (LPDDR4/4X) in common bus training mode. Issue MRW-1 command followed by MRW-2 command to set MR13 OP[0]=1'b1 (command bus training mode enabled).
- After tMRD, configure DDRPHY in command bus training mode.
  - Set DDRPHY_CAL_CON0.ca_cal_mode=1'b1.
  - Set DDRPHY_CBT_CON0.cbt_vref_dqs_en=1'b1.
  - After tDQSCKE, set DDRPHY_CBT_CON3.cbt cke=2'b0.
- After tCKELCK, change CK frequency to the highest operating frequency.
- Configure CA Vref setting.

Copyright © 2024 Rockchip Electronics Co., Ltd.

- Set DDRPHY_CBT_CON0.cbt_ca_vref=CA Vref setting value(MR12 OP[6: 0]).
- Set DDRPHY_CAL_CON3.wr_sw_mode=1'b1.
- Set DDRPHY_WR_LVL_CON2.ctrl_dqs_shift=1'b1.
- After tCAENT(20ns), set DDRPHY_CBT_CON0.cbt_vref_dq_en=1'b1 to drive CA vref setting value on DQ.
- Wait until DDRPHY_CBT_CON5.cbt_tDSTRAIN+ DDRPHY_CBT_CON5.cbt_tDHTRAlN+6 DFI clock cycle.
- Set DDRPHY_CBT_CON0.cbt_vref_dq_ en=1'b0.
- Set DDRPHY_WR_LVL CON2.ctrl dqs shift=1'b0.
- Set DDRPHY_CAL_CON3.wr_sw_mode=1'b0.
- Wait for tVREF_LONG(250ns max).
- Set DDRPHY_CBT_CON0.cbt_sw_mode=1'b1.

- Run command bus training (CA training/CS fine training) as followings.

If two ranks are used, CS1DeSkewCode should be applied by training result of CS0 (CS0DeSkewCode).

- Exit command bus training.
  - Set DDRPHY_CBT_CON3.cbt_cke= 2'b11
  - Wait for tCKEHDQS.

Copyright © 2024 Rockchip Electronics Co., Ltd.

- Set DDRPHY_CBT_CON0.cbt_vref_dqs_en=1'b0.
- Set DDRPHY_CAL_CON0.ca_cal_mode=1'b0.
- Set DDRPHY_CBT_CON0.cbt_sw_mode=1'b0.
- After tFC(20ns), memory controller should configure memory(LPDDR4/4X)in normal mode.

Following steps are for HW command bus training mode.

- Change to the low frequency (under 200MHz)
- Set DDRPHY_LP_CON0.ds_io_pd=1'b0.
- Set DDRPHY_CAL_CON0.ca_swap_mode_dis=1'b1.
- Apply DQS offset
  - DDRPHY_CAL_CON3.wrlvl_sw_mode=1'b1
  - DDRPHY_WR_LVL_CON0.ctrl_wrlvl*_code =ck_offset(ck_offset=91ps/tFS, tFS: finedelay).
  - Enable DDRPHY_OFFSETD_CON0.ctrl_resync.
  - Disable DDRPHY_OFFSETD_CON0.ctrl_ resync.
  - DDRPHY_CAL_CON3.wrlvl_sw_mode=1'b0.
- Controller should configure memory(LPDDR4/4X)in command bus training mode. Controller should issue MRW-1 command followed by MRW-2 command to set MR13 OP[0]=1'b1(command bus training mode enabled).
- After tMRD, configure DDRPHY in command bus training mode.
  - Enable DDRPHY_CAL CON0.ca_cal_mode.
  - Set DDRPHY_CBT_CON0.cbt_vref_dqs_en as 2'b01.
  - After tDQSCKE, set DDRPHY_CBT_CON2.cbt_cke as 2'b00.
- After tCKELCK, change CK frequency to the highest operating frequency.
- Configure CA Vref setting
  - Set CA Vref setting value(MR12 OP[6:0]) in DDRPHY_CBT_CON0.cbt_ca_vref.
  - Enable DDRPHY_CAL_CON3.wr_sw_mode.
  - Set DDRPHY_WR_LVL_CON2.ctrl_dqs_shift=1'b1.
  - After tCAENT(20ns), set DDRPHY_CBT_CON0.cbt_vref_dq_en as 2'b01 to drive CA vref setting value on DQ.
  - Wait until DDRPHY_CBT_CON5.cbt_tDSTRAIN+ DDRPHY_CBT_CON5.cbt_tDHTRAIN+6 DFI clock cycle.
  - Set DDRPHY_CBT_CON0.cbt_vref_dq_en as 2'b00.
  - Set DDRPHY_WR_LVL_CON2.ctrl_dqs_shift=1'b0.
  - Disable DDRPHY_CAL_CON3.wr_sw_mode.
  - Wait for tVREF_LONG(250ns max).
- Start CS/CA calibration.
  - Apply CK/CS offset.
    Enable DDRPHY_CBT_CON0.cbt_sw_mode.
    Set DDRPHY_CA_DESKEW_CON4.CKDeSkewCode=ck_offset(ck_offset=91ps/tFS, tFS: finedelay).
    Set DDRPHY_CA_DESKEW_CON5.CS0DeSkewCode=ck_offset(ck_offset=91ps/tFS, tFS: finedelay).
    Enable DDRPHY_OFFSETD_CON0.ctrl_resync.
    Disable DDRPHY_OFFSETD_CON0.ctrl_resync.
    Disable DDRPHY_CBT_CON0.cbt_sw_mode.
  - Enable DDRPHY_LP_CON0.scheduler_HW_clock_gating_disable.
  - Enable DDRPHY_LP_CON0.ctrl_scheduler_en.
  - Enable DDRPHY_CBT_CON0.cbt_cs_coarse_dis.
  - Enable DDRPHY_CBT_CON3.cbt_hw_cal_start.
  - Wait until DDRPHY_CBT_CAL_STAT0.cbt_hw_cal_done.
  - Disbale DDRPHY_LP_CON0.ctrl_scheduler_en.
  - Disable DDRPHY_LP_CON0.scheduler_HW_clock_gating_disable.
- Exit command bus training.
  - Set DDRPHY_CBT_CON2.cbt_cke as 2'b11.
  - Wait for tCKEHDQS.
  - Set DDRPHY_CBT_CON0.cbt_vref_dqs_en as 2'b00.

Copyright © 2024 Rockchip Electronics Co., Ltd.

- Set DDRPHY_CAL_CON0.ca_cal_mode to 1'b0.
- Disable DDRPHY_CBT_CON3.cbt_hw_cal_start.
- After tFC(20ns), memory controller should configure memory (LPDDR4/4X) in normal mode.

7.6.4.2 LPDDR4/4X DQS Clean Procedure

1. Auto DQS clean mode

The goal of auto DQS clean mode is to get valid read DQS without the gate training. Auto DQS clean mode can be used if VSSQ termination is enabled.

- Set DDRPHY_TESTIRCV_CON0.dqs0_testircv=4'h3, DDRPHY_TESTIRCV_CON0.dqs1_testircv=4'h3.
- Set DDRPHY_CAL_CON0.gate_cal_mode=1'b0.
- Enable DDRPHY_CAL_CON3.auto_dqs_clean.
- Set DDRPHY_CAL_CON2.ctrl_rodt_disable=1'b0.

2. DQS Clean Using IO RCV Single-Ended(SE) mode on VSSQ Termination (Mandatory under 2133Mbps)

The goal of DQS clean using IO RCV SE mode is to get valid read DQS without the gate training and auto DQS clean on VSSQ termination on. It is allowed under 2133Mbps and IO RCV SE mode and RCV ODT should be enabled.

7.6.4.3 LPDDR4/4X Read DQ Calibration

Read DQ calibration adjusts DQS and DQ delay to compensate the skew introduced by the package, board and on-chip to maximize the setup and hold timing margin.

- Configure DDRPHY training pattern registers in DDRPHY_CAL_RD_PATTERN_CON0.
  - Set rdtrn_inv_pattern_ds0=0xee, rdtrn_inv_pattern_ds1=0xee, rdtrn_rddata_pattern0=0x55 and rdtrn_rddata_pattern1=0x55.
  - Configure DDRPHY_OP_CODE_RDC registers for MR32, MR40, MR20 and MR15 such that the training pattern output from DRAM is the same as the training pattern defined above.
  - Configure MR32, MR40, MR25 and MR15 for read training pattern. OP_CODE_PATA=0x55(=rdtrn_rddata_pattern0), OP_CODE_PATB =0x55(=rdtrn_rddata_pattern1), OP_CODE_INVA=0xee(=rdtrn_inv_pattern_ds0), OP_CODE_INVB=0xee(=rdtrn_inv_pattern_ds1).
  - rdtrn_inv_pattern should be the same per BYTE.
  - Based on the DDRPHY_OP_CODE* values, DDRPHY will send MRW for MR31, MR32, MR3 and MR34 to DRAM at the beginning of Read training.
- Configure DDRPHY in read training mode.
  - Set DDRPHY_SCHD_TRAIN_CON0.phy_rdtrn_en=1'b1.
  - Set SCHD_TRAIN_CON0.phy_rdtrn_rank_en properly. For example, if phy_rdtrn_rank_en is set to 2'b11, per-rank read training will start from rank-0 to rank-1 sequentially. Any rank can be enabled for read training. For example, it is possible to set phy_rdtrn_rank_en= 2'b10.

Caution: For Read DQ's setup/hold margin maximization, read DQ delay should bigger than read DOS delay.

Caution: Pattern configuration is an example. Training pattern can be changed by user selection.

7.6.4.4 LPDDR4/4X Write DQ Calibration Initiated by DDRPHY

Write DQ calibration adjusts for the delays introduced by the memory (tDQS2DQ), package, board and on-chip that impact the write cycle.

Normal Initial Training Setting (533MHz or more)

- If data mask and DBI are all disabled at DRAM, set DDRPHY_CAL_CON0.wrtrn_dbi_cal_en=1'b0. Otherwise, set to 1'b1.
- If current frequency is equal or greater than 1066MHz
  - Set DDRPHY_CAL_CON5.wrtrn_cyc_en=1 and DDRPHY_CAL_CON5.wrtm_cyc_mode=0 (High frequency cycle based training mode).
  - Set DDRPHY_CAL_CON5.wrtrn_cyc_th=0x1f.
- If current frequency is less than 1066MHz and equal to or greater than 533MHz, set

Copyright © 2024 Rockchip Electronics Co., Ltd.

- DDRPHY_CAL_CON5.wrtrn_cyc_en=1 and DDRPHY_CAL_CON5.wrtm_cyc_mode=1 (Low frequency cycle based training mode).
- Increase DDRPHY_CAL_CON4.num_repeat to make the initial training result stable.
- Set DDRPHY_CAL_CON4.wrtrn_multi_pattern to 1, to use more patterns during the initial training. Additional patterns should be defined in DDRPHY_CAL_WR_PATTERN2_CON0~4, DDRPHY_CAL_WR_PATTERN3_CON0~4, DDRPHY_CAL_WR_PATTERN4_CON0~4.
- DDRPHY_CAL_CON5.wrtm_cyc_mode should be 0 during normal operation.

Low Frequency Initial Training Setting (under 533MHz)-

- Set DDRPHY_CAL_CON0.dvfs_wr_train_en=0x1.
- Set DDRPHY_CAL_CON4.dvfs_wr_start_adj=0x0.
- Set DDRPHY_CAL_CON5.wrtm_cyc_en=0.
- After low frequency write training is done, apply the following setting.
  - Store the current lockvalue/4 value.
  - Store write training results from DDRPHY_WR_DESKEWC_CS*_CON*, DDRPHY_DM_DESKEWC_CS*_CON*.
  - Write (stored write training result values+lockvalue*2/4 value) to the following registers.
    - Enable DDRPHY_CAL_CON0.wr_cal_mode.
    - Enable DDRPHY_CAL_CON3.wr_sw_mode.
    - DDRPHY_SW_WR_DESKEWC_CS*_CON, DDRPHY_SW_DM_DESKEWC_CS*_CON*.
    - Disable DDRPHY_CAL_CON3.wr_sw_mode.
    - Enable DDRPHY_OFFSETD_CON0.ctrl_resync.
    - Disable DDRPHY_OFFSETD_CON0.ctrf_resync.
- Restore DVFS write training related setting for successful DVFS write training or other initial write training.
  - Set DDRPHY_CAL_CON4.dvfs_wr_slart_adj=0xf.
  - Set DDRPHY_CAL_CON0.dvfs_wr_train_en=0.

Common Setting for Write Training

- Set write training paltem
  - DQ pattern in DDRPHY_CAL_WR_PATTERN1_CON0~ DDRPHY_CAL_WR_PATTERN1_CON3.
- Set wrtrn_rddata_adj_w0_bst1_8 for BL1~BL2 pattern.
- Set wrtrn_rddata_adj_w1_bst1_8 for BL3~BL4 pattern.
- Set wrtm_rddata_adj_w2_bst1_8 for BL5~BL6 pattern.
- Set wrtrn_rddata_adj_w3_bst1_8 for BL7~BL8 pattern.
- Set wrtm_rddata_adj_w0_bst9_16 for BL9~BL10 pattern.
- Set wrtrn_rddata_adj_w1_bst9_16 for BL11~BL12 pattern.
- Set wrtm_rddata_adj_w2_bst9_16 for BL13-BL14 pattern.
- Set wrtrn_rddata_adj_w3_bst9_16 for BL15~BL16 pattern.
- Set write DM pattern in CAL_WR_PATTERN1_CON4.
- Set wrtrn_rddata_dm_adj_w0_bst1_8 for BL1~BL2 pattern.
- Set wrtrn_rddata_dm_adj_w1_bst1_8 for BL3~BL4 pattern.
- Set wrtrn_rddata_dm_adj_w2_bst1_8 for BL5~BL6 pattern.
- Set wrtrn_rddata_dm_adj_w3_bst1_8 for BL7~BL8 pattern.
- Set wrtrn_rddata_dm_adj_w0_bst9_16 for BL9~BL10 pattern.
- Set wrtrn_rddata_dm_adj_w1_bst9_16 for BL11~BL12 pattern.
- Set wrtrn_rddata_dm_adj_w2_bst9_16 for BL13~BL14 pattern.
- Set wrtrn_rddata_dm_adj_w3_bst9_16 for BL15~BL16 pattern.
- Configure DDRPHY in write training mode.
  - Set DDRPHY_SCHD_TRAIN_CON0.phy_wrtrn_en=1.
  - Set DDRPHY_SCHD_TRAIN_CON0.phy_wrtrn_rank_en properly.
  - For example, if phy_wrtrn_rank_en is set to 0x3, per-rank write training will start from rank0 to rank1 sequentially.

7.6.4.5 LPDDR4/4X Periodic Training

Periodic training using PHY master interface

Periodic write training compensates write center shift and gate shift caused by VT variation in memory. Initial training should be completed before periodic training. During periodic training, DDRPHY uses the PHY master interface and generates MPC commands without the memory controller. When DDRPHY request PHY master mode, the controller should place the DRAM in self refresh and assert dfi_phymstr_ack. Periodic write training will be executed in sequence.

- The common parameter is same as initial training.
- Enable periodic gate training properly (refer to SFR description)
  - Set DDRPHY_SCHD_TRAIN_CON0.periodic_gttrn_en and if use DVFS, set DDRPHY_DVFS0_TRAIN_CON0.dvfs0_periodic gttrn_en and DDRPHY_DVFS1_TRAIN_CON0.dvfs1_periodic_gttrn_en.
- Enable periodic write training properly. Mandatory up to 2133Mbps.
  - Set DDRPHY_SCHD_TRAIN_CON0.periodic_wrtrn_en and if use DVFS, set DDRPHY_DVFS0_TRAIN_CON0.dvfs0_periodic_wrtrn_en and DDRPHY_DVFS1_TRAIN_CON0.dvfs1_periodic_wrtrn_en.
- Set DDRPHY_SCHD_TRAIN_CON1.periodic_time.
  - Interval of periodic training = periodic_time*tCK_osc (oscillator dock).
- Set DDRPHY_SCHD_TRAIN_CON1.periodic_en =1 and if use DVFS, set DDRPHY_DVFS0_SCHD_TIME_CON3.dvfs0_periodic_en and DDRPHY_DVFS1_SCHD_TIME_CON3.dvfs1_periodic_en properly.
- Set DDRPHY_SCHD_TRAIN_CON1.periodic en = 0 for disable periodic training and if use DVFS, set DDRPHY_DVFS0_SCHD_TIME_CON3.dvfs0_periodic_en and DDRPHY_DVFS1_SCHD_TIME_CON3.dvfs1_periodic_en properly.

DVFS training using PHY master interface

DVFS training compensates write center shift and gate shift caused by VT variation in memory. Initial write/gate training should be completed before DVFS training. During DVFS training, DDRPHY uses the PHY master interface and generates MPC commands without the memory controller. When DDRPHY request PHY master mode, the controller should place the DRAM in self refresh and assert dfi_phymstr_ack. DVFS training will be executed in sequence.

- The common parameter is same as initial training.
- Enable DVFS gate training properly
  - Set DDRPHY_SCHD_TRAIN_CON0.dvfs_gttrn_en and if use DVFS, set DDRPHY_DVFS0_SCHD_TIME_CON3.dvfs0_dvfs_gttrn_en and DDRPHY_DVFS1_SCHD_TIME_CON3.dvfs1_dvfs_gttrn_en.
- Enable DVFS write training properly.
  - Set DDRPHY_SCHD_TRAIN_CON0.dvfs_wrtrn_en and if use DVFS, set DDRPHY_DVFS0_SCHD_TIME_CON3.dvfs0_dvfs_wrtrn_en and DDRPHY_DVFS1_SCHD_TIME_CON3.dvfs1_dvfs_wrtrn_en.
- Set DDRPHY_CAL_CON0.dvfs_wr_train_en=1(DVFS mode).

7.6.5 LPDDR5 Training Procedure

Settings before training.

- Set DDRPHY_OFFSETD_CON0.upd_mode=0 for PHY-initiated update mode.
- Write the current frequency to DDRPHY_DVFS_CON.freq_train.
- Initial Vref setting.
- Set DDRPHY_MDLL_CON1.clkm_cg_en_sw=1 to freeze DLL lock value during training for stability.

Before DRAM interface training, training setting should be configured properly.

- LP5 SW CBT (command bus training)
- Auto DQS clean
- Read Calibration
- Write DQ Calibration

To set DDRPHY training under 1600Mbps at MODE4/3, under 1067Mbps at MODE2, DDRPHY training need WCK2CK sync always on mode and DDRPHY_WCK2CKSYNC_CON0.ctrl_WCK_MODE_APB=1. So please follow the DDRPHY training procedure below.

Set MR18 OP[4]=0(always on disable), CAS_EN=1, WCK_MODE=0 ==> CBT/WCK2CK

leveling(if needed) ==> set MR18 OP[4]=1(always on), CAS_EN=0,WCK_MODE=1 ==> Send CAS command to memory ==> set dfi_wck_en always 1 ==> DDRPHY training except CBT, WCK2CK leveling (if needed) ==> User choice for WCK2CK sync operation (if use wck2ck sync always on, please keep it or if not, set MR18 OP[4]=0(always on disable), CAS_EN=1,WCK_MODE=0 ==>Do normal transactions.
After training setting is done, apply the following sequence.

- Configure common parameter training properly.
  - Set DDRPHY_SCHD_TIME_CON0.phy_t_rddata_en='d6.
  - Set DDRPHY_SCHD_TIME_CON0.WL to match it with DRAM WL setting.
  - Set DDRPHY_SCHD_TIME_CON1.tCCD=0x8(LPDDR5).
  - Set DDRPHY_SCHD_TIME_CON1.tWTR=0x1f.
  - If WCK always on disable, set DDRPHY_WCK2CKSYNC_CON0.ctrl_WCK_MODE_APB=0x0 and DDRPHY_SCHD_CMD_CON0.CAS_EN_APB=0x1.
  - If WCK always on, set WCK2CKSYNC_CON0.ctrl_WCK_MODE_APB=0x1 and SCHD_CMD_CON0.CAS_EN_APB=0x0.
  - WCK should be driven by memory controller at WCK always on mode.
- Set MR operand code same as setting on memory.
  - For LPDDR5, DDRPHY_LP5_MR_OP.
- Enable DDRPHY training mode.
  - Set DDRPHY_SCHD_TRAIN_CON0.phy_train_en=0x1.
- Wait until SCHD_TRAIN_CON0.phy_train_done=0x1.
- Disable DDRPHY training mode.
  - Set DDRPHY_SCHD_TRAIN_CON0.phy_train_en=0x0.
- Setting after training.
  - Set DDRPHY_MDLL_CON0.clkm_cg_en_sw=0 to enable DLL locking.
  - Set DDRPHY_CAL_CON5.wrtrn_cyc_mode=0 during normal operation.
  - Set DDRPHY_CAL_CON0.cal_vtc_en=1 to compensate voltage, temperature variation on calibration results.
  - Set DDRPHY_CAL_CON0.dvfs_wr_train_en=1 initial write training (Write training with dfi_lvl_periodic=0) will be interpreted as DVFS write training afterwards.
- Update DDRPHY DLL
  - Enable DDRPHY_OFFSETD_CON0.ctrl_resync.
  - Disable DDRPHY_OFFSETD_CON0.ctrl_resync.
- The DDRPHY should start the periodic training to compensate DRAM voltage/temperature variation followed by periodic training guide.
  - Write periodic training.

7.6.5.1 LPDDR5 Command Bus Training

LPDDR5 only supports SW command bus training mode. LPDDR5 SW command bus training supports CA bit de-skewing function. The overall sequence is CA left edge searching-CA right edge searching-Calculation center code of CA. Because LPDDR5 CA is DDR (CA is captured at CK rising edge and falling edge), the edge should be searched with changing CBT-PH mode. **Setting before Training**

- Before CBT training start, check if MR13 OP[6]=1 for CBT mode2.
- Set DDRPHY_SCHD_CMD_CON0.RANK_SEL=cs.
- Set DDRPHY_CBT_CON2.cbt_dqdm_sel=0x80.
- Set DDRPHY_CBT_CON0.cbt_sw_mode=0x1.
- Set DDRPHY_CBT_CON2.cbt_tWCK2DQ7 satisfying memory timing parameter tWCK2DQ7H.
- Set DDRPHY_CBT_CON2.cbt_tDSTRAIN_LP5 satisfying memory timing parameter tDStrain.

CA Left Edge Searching with CBT-PH[7]=1'b0

- Entering CBT Mode
  - Configure the memory entering CBT mode.
    - Set DDRPHY_SCHD_CON0.scheduler_sw_mode=0x1.
    - Set DDRPHY_CAL_CON0.ca_cal_mode=0x1.

Copyright © 2024 Rockchip Electronics Co., Ltd.

- Set DDRPHY_CBT_CON0.cbt_vref_dqs_en=0x1.
- Set DDRPHY_WCK2CKSYNC_CON0.wck_out_enable=0x1.
- Set DDRPHY_SCHD_CMD_CON2.MA_CODE=0x10.
- Set DDRPHY_SCHD_CMD_CON2.OP_CODE=0x10.
- Toggle DDRPHY_SCHD_DIRECT_CMD3.CMD_MWR_req.

- Configure the PHY entering CBT mode.
  - Set DDRPHY_CBT_CON0.cbt_vref_dq_en=0x1.
  - Set DDRPHY_CBT_CON2.cbt_start=0x1.
  - Wait for tDQ7HWCK+tDQ72DQ (255ns).
  - Set DDRPHY_CBT_CON2.cbt_wck_en=0x1.
  - Toggle DDRPHY_CBT_CON2.cbt_vref_set_en.
  - Set DDRPHY_CBT_CON2.cbt_dq_rcv_en=0x1.
  - Set DDRPHY_CBT_CON3.cbt_en=0x1.
  - Toggle DDRPHY_OFFSETD_CON0.ctrl_resync.

- Searching CA Left edge as followings.

7.6.5.2 LPDDR5 DQS Clean Procedure

Auto DQS Clean (Mandatory above 3200Mbps)

The goal of auto DQS clean mode is to get valid read DQS without the gate training. Auto DQS clean mode can be used if VSSQ termination is enabled.

- Set DDRPHY_TESTIRCV_CON0.dqs0_testircv=0x3, DDRPHY_TESTIRCV_CON0.dqs1_testircv=0x3.
- Set DDRPHY_CAL_CON0.gate_cal_mode=0x0.
- Enable DDRPHY_CAL_CON3.auto_dqs_clean.
- Set DDRPHY_CAL_CON2.ctrl_rodt_disable=0x0.

If auto DQS clean mode is enabled, RL should be minimum RL of below table or more. The memory post_amble duration should be 4.5tWCK static and preamble duration should be 2tWCK static, 2tWCK toggle or 4tWCK static.

Table 7-3 Minimum Read Latency for LPDDR5 Auto DQS Clean Enable

PHY mode	0	1	2	3	4
Memory Type	LPDDR4/4X		LPDDR5		

MinReadLatencyw/AutoDQSEnable	28CK	24CK	14CK(28WCK)	9CK(36WCK)	9CK(36WCK)

DQS Clean Using IO RCV Single-Ended (SE) Mode on VSSQ Termination (Mandatory under 3200Mbps)

The goal of DQS clean using IO RCV SE mode is to get valid read DQS without the gate training and auto DQS clean on VSSQ termination ON. It is allowed under 3200Mbps and IO RCV SE MODE and RCV ODT should be enabled.

7.6.5.3 LPDDR5 Read DQ Calibration

Read Calibration adjusts DQS and DQ delay to compensate the skew introduced by the package, board and on-chip to maximize the setup and hold timing margin.

- Configure PHY training pattern registers in CAL_RD_PATTERN_CON0.
  - Set rdtrn_inv_pattern_ds0=0xee, rdtrn_inv_pattern_ds1=0xee, rdtrn_rddata_pattern0=0x55 and rdtrn_rddata_pattern1=0x55.
  - Configure DDRPHY_OP_CODE_RDC registers for MR31, MR32, MR33 and MR34 such that the training pattern output from DRAM is the same as the training pattern defined above.
  - Configure MR31, MR32, MR33 and MR34 for read training pattern.
    - OP_CODE_PATA=0x55(rdtrn_rddata_pattern0), OP_CODE_PATB=0x55(rdtrn_rddata_pattern1), OP_CODE_INVA=0xee(rdtrn_inv_pattern_ds0), OP_CODE_INVB=0xee(rdtrn_inv_pattern_ds1).
    - Rdtrn_inv_pattern should be the same per BYTE.
    - Based on the OP_CODE_* values, PHY will send MRW for MR31, MR32, MR33 and MR34 to DRAM at the beginning of read training.
- Configure DDRPHY and memory in link ECC mode, if link ECC is enabled.
  - Configure memory in link ECC mode.
    - Issue MR3 command to set DBI-WR enabled and DBI-RD disabled.
    - Issue MR22 command to enable link ECC mode.
  - Configure DDRPHY in link ECC mode.
    - Set DDRPHY_CAL_CON0.rdtrn_dbi_cal_en =0x1.
    - Set DDRPHY_CAL CON3.ctrl_link_ecc_mode=0x1.

Copyright © 2024 Rockchip Electronics Co., Ltd.

- Configure DDRPHY in read training mode.
  - Set DDRPHY_SCHD_TRAIN_CON0.phy_rdtrn_en=1
  - Set DDRPHY_SCHD_TRAIN_CON0.phy_rdtrn_rank_en properly.
    - For example, if phy_rdtrn_rank_en is set to 2'b11, per-rank read training will start from rank0 to rank1 sequentially.
    - Any rank can be enabled for read training. For example, it is possible to set phy_rdtrn_rank_en=2'b10.

7.6.5.4 LPDDR5 Write DQ Calibration

Normal Initial Training Setting (533MHz or More)

- If data mask and DBI are all disabled at DRAM, set DDRPHY_CAL_CON0.wrtrn_dbi_cal_en=0. Otherwise set to 1.
- Configure DDRPHY and memory in link ECC mode if link ECC is enabled.
  - Configure memory in link ECC mode.
    - Issue MR3 command to set DBI-WR enabled and DBI-RD disabled.
    - Issue MR22 command to enable link ECC mode.
  - Configure DDRPHY in link ECC mode.
    - Set DDRPHY_CAL_CON0.wrtrn_dbi_cal_en=0x1.
    - Set DDRPHY_CAL_CON3.ctrl_link_ecc_mode=0x1.
- If current frequency is equal to or greater than 1066MHz
  - Set DDRPHY_CAL_CON5.wrtrn_cyc_en=1 and DDRPHY_CAL_CON5.wrtrn_cyc_mode=0(High frequency cycle based training mode).
  - Set DDRPHY_CAL_CON5.wrtrn_cyc_th=31(LPDDR5).
  - If PRBS write training is to be enabled after write training is done
    - Set DDRPHY_MDLL_CON0.clkm_cg_en_sw=1
    - Read DDRPHY_MDLL_CON1.ctrl_lock_value
    - Set DDRPHY_CAL_CON5.wrtrn_cyc_th=ctrl_lock_value/4
    - Set DDRPHY_MDLL_CON0.clkm_cg_en_sw=0
- If current frequency is less than 1066MHz and equal to or greater than 533MHz, set DDRPHY_CAL_CON5.wrtrn_cyc_en=1 and DDRPHY_CAL_CON5.wrtrn_cyc_mode=1(Low frequency cycle based training mode).
- Increase DDRPHY_CAL_CON4.num_repeat to make the initial training result stable.
- Set DDRPHY_CAL_CON4.wrtrn_multi_pattern to 1 to use more patterns during the initial training. Additional patterns should be defined in DDRPHY_CAL_WR_PATTERN2_CON0~4, DDRPHY_CAL_WR_PATTERN3_CON0~4, DDRPHY_CAL_WR_PATTERN4_CON0~4.
- DDRPHY_CAL_CON5.wrtrn_cyc_mode should be 0 during normal operation.

Low Frequency Initial Training Setting (under 533MHz)

- Set DDRPHY_CAL_CON0.dvfs_wr_train_en=0x1.
- Set DDRPHY_CAL_CON4.dvfs_wr_start_adj=0x0.
- Set DDRPHY_CAL_CON5.wrtrn_cyc_en=0.
- After low frequency write training is done, apply the following setting.
  - Store the current lockvalue/4 value.
  - Store write training results from DDRPHY_WR_DESKEWC_CS*_CON*, DDRPHY_DM_DESKEWC_CS*_CON*, DDRPHY_ECC_DESKEWC_CS*_CON*.
  - Write (stored write training result values + lockvalue/4) to the following register.
    - Enable DDRPHY_CAL_CON0.wr_cal_mode.
    - Enable DDRPHY_CAL_CON3.wr_sw_mode.
    - DDRPHY_SW_WR_DESKEWC_CS*_CON, DDRPHY_SW_DM_DESKEWC_CS*_CON*, DDRPHY_SW_ECC_DESKEWC_CS*_CON*.
    - Disable DDRPHY_CAL_CON3.wr_sw_mode.
  - Restore DVFS write training related setting for successful DVFS write training or other initial write training.
    - Set DDRPHY_CAL_CON4.dvfs_wr_start_adj=0xf.
    - Set DDRPHY_CAL_CON0.dvfs_wr_train_en=0.

Common Setting for Write Training

Copyright © 2024 Rockchip Electronics Co., Ltd.

- Set write training pattern
  - DQ pattern in DDRPHY_CAL_WR_PATTERN1_CON0~ DDRPHY_CAL_WR_PATTERN1_CON3.
- Set wrtrn_rddata_adj_w0_bst1_8 for BL1~BL2 pattern.
- Set wrtrn_rddata_adj_w1_bst1_8 for BL3~BL4 pattern.
- Set wrtm_rddata_adj_w2_bst1_8 for BL5~BL6 pattern.
- Set wrtrn_rddata_adj_w3_bst1_8 for BL7~BL8 pattern.
- Set wrtm_rddata_adj_w0_bst9_16 for BL9~BL10 pattern.
- Set wrtrn_rddata_adj_w1_bst9_16 for BL11~BL12 pattern.
- Set wrtm_rddata_adj_w2_bst9_16 for BL13-BL14 pattern.
- Set wrtrn_rddata_adj_w3_bst9_16 for BL15~BL16 pattern.
- Set write DM pattern in DDRPHY_CAL_WR_PATTERN1_CON4.
- Set wrtrn_rddata_dm_adj_w0_bst1_8 for BL1~BL2 pattern.
- Set wrtrn_rddata_dm_adj_w1_bst1_8 for BL3~BL4 pattern.
- Set wrtrn_rddata_dm_adj_w2_bst1_8 for BL5~BL6 pattern.
- Set wrtrn_rddata_dm_adj_w3_bst1_8 for BL7~BL8 pattern.
- Set wrtrn_rddata_dm_adj_w0_bst9_16 for BL9~BL10 pattern.
- Set wrtrn_rddata_dm_adj_w1_bst9_16 for BL11~BL12 pattern.
- Set wrtrn_rddata_dm_adj_w2_bst9_16 for BL13~BL14 pattern.
- Set wrtrn_rddata_dm_adj_w3_bst9_16 for BL15~BL16 pattern.
- Configure DDRPHY in write training mode.
  - Set DDRPHY_SCHD_TRAIN_CON0.phy_wrtrn_en=1.
  - Set DDRPHY_SCHD_TRAIN_CON0.phy_wrtrn_rank_en properly.
  - For example, if phy_wrtrn_rank_en is set to 0x3, per-rank write training will start from rank0 to rank1 sequentially.

7.6.5.5 LPDDR5 Periodic Training

Periodic training compensates write center shift and gate shift caused by VT variation in memory. Initial write/gate training should be completed before periodic training. During periodic training, DDRPHY uses the PHY master interface and generates RDC/WFF/RFF/MPC commands without the memory controller. When DDRPHY request PHY master mode, the controller should place the DRAM in self refresh and assert dfi_phymstr_ack. Periodic training will be executed in sequence.

- The common parameter is same as initial training.
- Enable periodic write training properly (refer to SFR description)
  - Set DDRPHY_SCHD_TRAIN_CON0.periodic_wrtrn_en and if use DVFS, set DDRPHY_DVFS0_TRAIN_CON0.dvfs0_periodic_wrtrn_en and DDRPHY_DVFS1_TRAIN_CON0.dvfs1_periodic_wrtrn_en.
- Set DDRPHY_SCHD_TRAIN_CON1.periodic_time.
  - Interval of periodic training = periodic_time*tCK_osc (oscillator clock).
- Set DDRPHY_SCHD_TRAIN_CON1/ DDRPHY_DVFS*_SCHD_TIME_CON3.periodic_en =1 and if use DVFS, set DDRPHY_DVFS0_SCHD_TIME_CON3.dvfs0_periodic_en and DDRPHY_DVFS1_SCHD_TIME_CON3.dvfs1_periodic_en properly.

7.6.5.6 LPDDR5 DVFS Training

DVFS training compensates write center shift and gate shift caused by VT variation in memory. Initial write/gate training should be completed before DVFS training. During DVFS training, DDRPHY uses the PHY master interface and generates RDC/WFF/RFF/MPC commands without the memory controller. When DDRPHY request PHY master mode, the controller should place the DRAM in self refresh and assert dfi_phymstr_ack. DVFS training will be executed in sequence.

- The common parameter is same as initial training.
- Enable DVFS write training properly.
  - Set DDRPHY_SCHD_TRAIN_CON0.dvfs_wrtrn_en and if use DVFS, set DDRPHY_DVFS0_SCHD_TIME_CON3.dvfs0_dvfs_wrtrn_en and DDRPHY_DVFS1_SCHD_TIME_CON3.dvfs1_dvfs_wrtrn_en.
- Set DDRPHY_CAL_CON0.dvfs_wr_train_en=1(DVFS mode).

7.6.6 DDR Monitor

1. DDR read or write address monitor

Copyright © 2024 Rockchip Electronics Co., Ltd.

DDR monitor module can store 4 consecutive read or write addresses in real time for each AXI port. We can read these addresses through APB bus for debug when system enters abnormal state. Each read or write address together with awid/arid and a*ready/a*valid signals are stored in two 32bits registers.
Following is an example of monitoring read port of AXI port n(n=0/1/2/3/4).
DDRMON_PORTn_ADDR_31_0={araddr_n[31:0]}
DDRMON_PORTn_ADDR_63_32={arid_n[7:0],arready_n,arvalid_n,araddr_n[33:32]}
Following is an example of monitoring write port of AXI port n(n=0/1/2/3/4).
DDRMON_PORTn_ADDR_31_0={awaddr_n[31:0]}
DDRMON_PORTn_ADDR_63_32={awid_n[7:0],awready_n,awvalid_n,awaddr_n[33:32]}
The steps of configuration to monitor DDR read or write address is as follows.

- Configure DDRMON_IF_CTRL.direction to select storing read or write address.
- Set DDRMON_IF_CTRL.if_mon_en to 1 to enable DDR monitor.
- When system is abnormal, we can read the register to get the current four addresses.

2. DDR access address monitor within a specified range

Sometimes we want to confirm whether DDR read or write within a specified address range on a certain AXI port, then we can configure the address range and enable this function.
The steps of configuration to monitor DDR access address within a specified range is as follows.

- Configure the write address range registers DDRMON_WR_START_ADDR, DDRMON_WR_END_ADDR, and read address registers DDRMON _RD_START_ADDR, DDRMON_RD_END_ADDR.
- Enable corresponding AXI write port access address monitor interrupt by configuring the register DDRMON_INT_MASK2[4:0], enable corresponding AXI read port access address monitor interrupt by configuring the register DDRMON_INT_MASK3[4:0].
- Set DDRMON_IF_CTRL.if_mon_en to 1 to enable DDR address monitor.
- If the read or write addresses hit the range, then interrupt will assert, and we can read the interrupt status register DDRMON_INT_STATUS1.

3. DDR access command statistics

This module can do the statistics about DDR access command, like write, read and active by monitoring DFI interface. There are two mode to do statistics, hardware mode and software mode. Two thresholds can be set, if read and write command number is more than high threshold, or less than low threshold, the interrupt will be asserted.

4. DDRCTL's LPR/HPR/WR CAM status statistics

The DDR monitor will monitor the DDRCTL's available LPR/HPR/WR CAM slot. The result can be read through LPR/HPR/WR_CREDIT_CNT* registers.

5. DDR low power statistics

It does the statistics about the low power period such as DDR self-refresh power down, power down, clkstop and PHY low power and so on. After compare statistics interrupt asserts, the low power period represent in correspond count register will be updated and can be accessed through APB bus interface.

6. DDR special pattern statistics for a designated bank

In this module, for a designated bank, which is software configured. DDRMON will statistic the count for special DDR command patterns:

- per_bank_rd_wr_per_act_max_number: count the max read and write commands in an active command to a precharge command interval.
- per_bank_series_rd_burst_max_number: count the max series read command in an active command to a precharge command interval.
- per_bank_series_rd_burst_times_number: count the total number of series read command.
- per_bank_series_wr_burst_max_number: count the max series write command in an active command to a precharge command interval.
- per_bank_series_wr_burst_times_number: count the total number of series write command.
- per_bank_rd2rd_page_hit_number: count the total number of back to back read command.
- per_bank_wr2wr_page_hit_number: count the total number of back to back write

Copyright © 2024 Rockchip Electronics Co., Ltd.

command.
- per_bank_rd2wr_page_hit_number: count the total number of read next to write command.
- per_bank_rd2rd_page_miss_number: count all RD-PRE-ACT-RD pattern.
- per_bank_wr2wr_page_miss_number: count all WR-PRE-ACT-WR pattern.
- per_bank_rd2wr_page_miss_number: count all RD-PRE-ACT-WR pattern.
- per_bank_wr2rd_page_miss_number: count all WR-PRE-ACT-RD pattern.

7. DDR special pattern statistics for all banks

In this module, DDRMON count the special pattern for all ranks and all banks.
- all_bank_act_act_number: count all ACT-ACT pattern
- all_bank_act_pre_number: count all ACT-PRE pattern
- all_bank_act_rdwr_same_number: count ACT-RD and ACT-WR pattern, which active command and read/write command with the same rank, same bank and same row.
- all_bank_rd2wr_number: count all RD-WR pattern.
- all_bank_wr2rd_number: count all WR-RD pattern.
- all_bank_series_rd_total_cnt_number: count all back to back read pattern.
- all_bank_series_wr_total_cnt_number: count all back to back write pattern.
- all_bank_series_rd_burst_max_number: count the longest series read command.
- all_bank_series_wr_burst_max_number: count the longest series write command.
- all_bank_series_rd_burst_times_number: count the count of all series read command interval.
- all_bank_series_wr_burst_times_number: count the count of all series write command interval.
- all_bank_tccdmw_cnt_number: count all mask write command.

8. Hardware mode

In hardware mode, a dfi timer is used to specify a statistics period, the command statistics is done in the statistics period. The dfi timer is running in 24MHz. After dfi timer counts to the threshold, and update the statistics value, the dfi timer will restart automatically, and count again.

The steps of hardware mode of DDR access command statistics is as follows.
- Configure register DDRMON_CTRL.hardware_en as 1 to enable hardware mode.
- Configure register DDRMON_TIMER_COUNT to set the dfi timer count threshold, the statistics is done in the period of timer being less than the value of DDRMON_TIMER_COUNT.
- Configure register DDRMON_CTRL.lpddr4_en and DDRMON_CTRL.lpddr5_en to set the DDR mode:

DDRMON_CTRL.lpddr4_en	DDRMON_CTRL.lpddr5_en	DDR mode
1	0	LPDDR4
0	1	LPDDR5

- Configure register DDRMON_FLOOR_NUMBER to specify the low threshold of interrupt, and configure register DDRMON_TOP_NUMBER to specify the high threshold of interrupt.
- Configure register DDRMON_CTRL.timer_cnt_en as 1 to start hardware mode.
- Wait for the interrupt to do following process. We also can read the read, write and active command number separately.

9. Software mode

In software mode, the statistics is controlled by software.

The steps of hardware mode of DDR access command statistics is as follows.
- Configure register DDRMON_CTRL.lpddr4_en and DDRMON_CTRL.lpddr5_en to set the DDR mode like hardware mode.
- Configure register DDRMON_CTRL.software_en as 1 to enable software mode statistics.

Configure register DDRMON_CTRL.software_en as 0 to stop the statistics, and generate the statistics result. We can read the read, write and active command number separately.

10. Start 2 channels DDR monitors and interconnect monitor at the same time

Each DDR channel has one DDR monitor. Following steps are to start these 2 DDR monitors and interconnect monitor working at the same time.
- Set GRF_DDR_COMMON_CON4[2:0] to 3'b111 to enable interconnect monitor

Copyright © 2024 Rockchip Electronics Co., Ltd.

controlled by DDR monitor.

- Set DDRMON_CTRL0.external_trigger_sel=1'b1 to select external control signal to start DDR monitor instead of setting DDRMON_CTRL0.software_start or DDRMON_CTRL0.timer_cnt_en.
- Set DDR monitor registers properly.
- Set interconnect monitor registers properly.
- Set GRF_DDR_COMMON_CON4[8] to 1'b1 to start DDR monitor and interconnect monitor. Then the 2 DDR monitor and interconnect monitor are working.

The steps to stop DDR monitor and interconnect monitor are as follows.

- Set GRF_DDR_COMMON_CON4[8] to 1'b0.

Chapter 8 Gigabit Media Access Controller (GMAC)

8.1 Overview

The Ethernet Quality-of-Service controller(EQOS is commonly referred to as GMAC in this document) provides a complete Ethernet interface from processor to a Reduced Media Independent Interface (RMII) and Reduced Gigabit Media Independent Interface (RGMII) compliant Ethernet PHY. The GMAC includes a DMA controller. The DMA controller efficiently moves packet data from microprocessor's RAM, formats the data for an IEEE 802.3-2002 compliant packet and transmits the data to an Ethernet Physical Interface (PHY). It also efficiently moves packet data from RXFIFO to microprocessor's RAM. There are two separate GMAC in RK3576.
The following features may or may not be present in the actual product. Please contact Rockchip for the actual feature configurations and the third-party licensing requirements.

8.1.1 MAC Features

8.1.1.1 MAC Tx and Rx Common Features

- Supports 10/100/1000-Mbps data transfer rates with the RGMII interfaces
- Supports 10/100-Mbps data transfer rates with the RMII interfaces
- Half-duplex operation:
  - CSMA/CD Protocol support
  - Flow control using back-pressure support (based on implementation-specific white papers and UNH Ethernet Clause 4 MAC Test Suite - Annex D)
  - Packet bursting and packet extension in 1000 Mbps half-duplex operation
- Standard IEEE 802.3az-2010 for Energy Efficient Ethernet in Reduced Gigabit Media Independent Interface (RGMII) PHYs
- 64-bit data transfer interface on the application side
- Full-duplex flow control operations (IEEE 802.3x Pause packets and Priority flow control)
- network statistics with RMON or MIB Counters (RFC2819/RFC2665)
- Support Ethernet packet timestamping as described in IEEE 1588-2002 and IEEE 1588-2008 (64-bit timestamps given in the Tx or Rx status of PTP packet). Both one-step and two-step timestamping is supported in TX direction
- Flexibility to control the Pulse-Per-Second (PPS) output signal (ptp_pps_o)
- Media clock generation and recovery
- MDIO (Clause 22 and Clause 45) master interface for PHY device configuration and management

8.1.1.2 MAC Tx Features

- Preamble and start of packet data (SFD) insertion
- Separate 32-bit status for each packet transmitted from the application
- Automatic CRC and pad generation controllable on a per-packet basis
- Programmable packet length to support Standard or Jumbo Ethernet packets with up to 16 KB of size
- Programmable Inter Packet Gap (40–96 bit times in steps of 8)
- IEEE 802.3x Flow Control automatic transmission of zero-quanta Pause packet when flow control input transitions from assertion to de-assertion (in full-duplex mode)
- Source Address field insertion or replacement, and VLAN insertion, replacement, and deletion in transmitted packets with per-packet or static-global control
- Insertion, replacement, or deletion of up to two VLAN tags
- Frame Preemption for MAC Tx

8.1.1.3 MAC Rx Features

- Automatic Pad and CRC Stripping options
- Option to disable Automatic CRC checking
- Preamble and SFD deletion
- Separate 112-bit or 128-bit status

Copyright © 2024 Rockchip Electronics Co., Ltd.

- Programmable watchdog timeout limit
- Flexible address filtering modes:
  - Up to 31 additional 48-bit perfect (DA) address filters with masks for each byte
  - Up to 96 additional 48-bit perfect (DA) address filters that can be selected in blocks of 32 and 64 registers
  - Up to 31 48-bit SA address comparison check with masks for each byte
  - 32 bit, 64 bit, 128 bit, or 256 bit Hash filter (optional) for multicast and unicast (DA) addresses
  - Option to pass all multi-cast addressed packets
  - Promiscuous mode to pass all packets without any filtering for network monitoring
  - Pass all incoming packets (as per filter) with a status report
- Additional packet filtering:
  - VLAN tag-based: Perfect match and Hash-based (optional) filtering. Filtering based on either outer or inner VLAN tag is possible
  - Layer 3 and Layer 4-based: TCP or UDP over IPv4 or IPv6
  - Extended VLAN tag based filtering 4, 8, 16, or 32 filter selection
- IEEE 802.1Q VLAN tag detection and option to delete the VLAN tags in received packets
- Optional module to detect remote wake-up packets and AMD magic packets
- Optional forwarding of received Pause packets to the application (in full-duplex mode)
- Frame Preemption for MAC Rx

8.1.2 MTL Features

8.1.2.1 MTL Tx and Rx Common Features

- 32-bit, 64-bit, or 128-bit Transaction Layer block (bridges the application and the MAC)
- Data transfers executed using simple FIFO protocol
- Synchronization for all clocks in the design (Transmit, Receive, and Application clocks)
- Optimization for packet-oriented transfers with packets delimiters
- Option to have dual-port RAM based asynchronous FIFO controllers or Single-port RAM based synchronous FIFO controllers
- RAM memory instantiation outside the top-level module to facilitate memory testing or instantiation
- Programmable burst length, up to half the size of the MTL Rx queue or Tx queue size, to support burst data transfer in the EQOS-MTL configuration
- Programmable threshold capability for each queue (default of 64 bytes)
- Optional Debug and slave mode operation on Queue 0 (default queue)

8.1.2.2 MTL Tx Features

- TX FIFO sizes on transmission is 16 KB
- Store-and-Forward mechanism or threshold mode (cut-through) for transmission to the MAC
- Programmable queue size in configurations with multiple queues. Each queue size can be programmed in terms of 256 bytes
- Automatic retransmission of collision packets in half-duplex mode
- Discard packets on late collision, excessive collisions, excessive deferral, and under-run conditions with appropriate status
- Disabling of Data Memory RAM chip-select when inactive to reduce power consumption
- Optional module to calculate and insert IPv4 header checksum and TCP, UDP, or ICMP checksum
- Programmable interrupt options for different operational conditions
- Statistics by generating pulses for packets dropped (because of underflow) in the Tx FIFO
- Optional packet-level control for
  - VLAN tag insertion or replacement
  - Ethernet source address insertion
  - Layer3/Layer4 Checksum insertion control
  - One-step timestamp
  - Timestamp control

Copyright © 2024 Rockchip Electronics Co., Ltd.

  - CRC and pad control
- Following scheduling algorithms in configurations with multiple queues:
  - Weighted Round Robin (WRR)
  - (When Data Center Bridging is enabled) Deficit Weighted Round Robin (DWRR)
  - (When Data Center Bridging is enabled) Weighted Fair Queuing (WFQ)
  - Strict Priority (SP)
  - (When Audio-Video Bridging is enabled) Credit-based Shaper (CBS)
  - (When TSN is enabled), Enhancement to Scheduled Traffic (EST)
  - (When TSN is enabled), Time Based Scheduling (TBS)
- Option to support dropping of Tx Status to improve the Transmit throughput

8.1.2.3 MTL Rx Features

- Rx queue sizes in the Receive path is 32 KB
- Insertion of Rx Status vectors into the Rx queue after the EOP transfer (in Threshold mode) and before SOP (in Store-and-Forward mode) in EQOS-MTL configuration
- Programmable Rx queue threshold (default fixed at 64 bytes) in Threshold (or cut-through) mode
- Option to filter all error packets on reception and not forward them to the application in the store-and-forward mode
- Option to forward the undersized good packets
- Statistics by generating pulses for packets dropped (because of overflow) in the Rx FIFO
- Automatic generation of Pause packet control or backpressure signal to the MAC based on the Rx Queue fill level
- Arbitration among queues when multiple queues are present. The following arbitration schemes are supported:
  - Weighted Round Robin (WRR)
  - Weighted Strict priority (WSP)
  - Strict Priority (SP)
- Option to replicate received multicast packets for transfer by multiple Rx DMA channels
- Option to have a programmable lookup table based flexible Parser for filtering and steering the Rx packets

8.1.3 DMA Block Features

- 64-bit data transfers
- Separate DMA channel in the Transmit path for each queue in MTL
- Single or multiple DMA channels for any number of queues in MTL Receive path
- Fully synchronous design operating on a single application clock (except for CSR module, when a separate CSR clock is configured)
- Optimization for packet-oriented DMA transfers with packet delimiters
- Byte-aligned addressing for data buffer support
- Dual-buffer (ring) descriptor support
- Descriptor architecture to allow large blocks of data transfer with minimum CPU intervention (each descriptor can transfer up to 32 KB of data)
- Comprehensive status reporting for normal operation and transfers with errors
- Individual programmable burst length for Tx DMA and Rx DMA engines for optimal host bus utilization
- Programmable interrupt options for different operational conditions
- Per-packet Transmit or Receive Complete Interrupt control
- Round-robin or fixed-priority arbitration between the Receive and Transmit engines
- Start and Stop modes
- Separate ports for host CSR access and host data interface
- support for TCP Segmentation Offload (TSO) and UDP Segmentation Offload (USO)
- Selectable number of Tx DMA channels with TSO/USO feature enabled
- Routing of received packets to the DMA channels based on the DA or VLAN Priority in multi-channel DMA configurations
- Option to split the packet header (Layer 3 and Layer 4) and payload in a different

Copyright © 2024 Rockchip Electronics Co., Ltd.

buffers
- Time-sensitive conditional packet fetching from system memory by comparing the Slot Time or IEEE 1588 time information provided in the descriptor (useful for AV applications)
- Programmable control for Transmit Descriptor posted writes to improve the throughput
- Sideband signals to control starting and stopping of DMA channels

8.2 Block Diagram

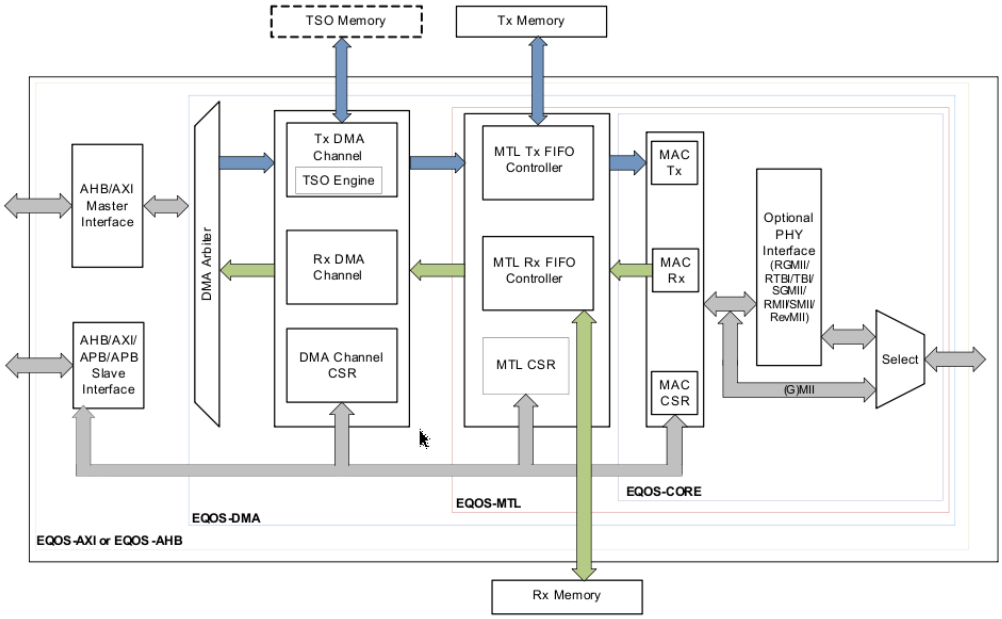

Fig. 8-1 GMAC Block Diagram

The GMAC is broken up into multiple separate functional units. These blocks are interconnected in the MAC module. The block diagram shows the general flow of data and control signals between these blocks.

The GMAC transfers data to system memory through the AXI master interface. The host CPU uses the APB Slave interface to access the GMAC subsystem's control and status registers (CSRs).

The GMAC supports the PHY interfaces of reduced GMII (RGMII) and reduced MII (RMII).

The Transmit FIFO (Tx FIFO) buffers data read from system memory by the DMA before transmission by the GMAC Core. Similarly, the Receive FIFO (Rx FIFO) stores the Ethernet frames received from the line until they are transferred to system memory by the DMA. These are asynchronous FIFOs, as they also transfer the data between the application clock and the GMAC line clocks.

Copyright © 2024 Rockchip Electronics Co., Ltd.

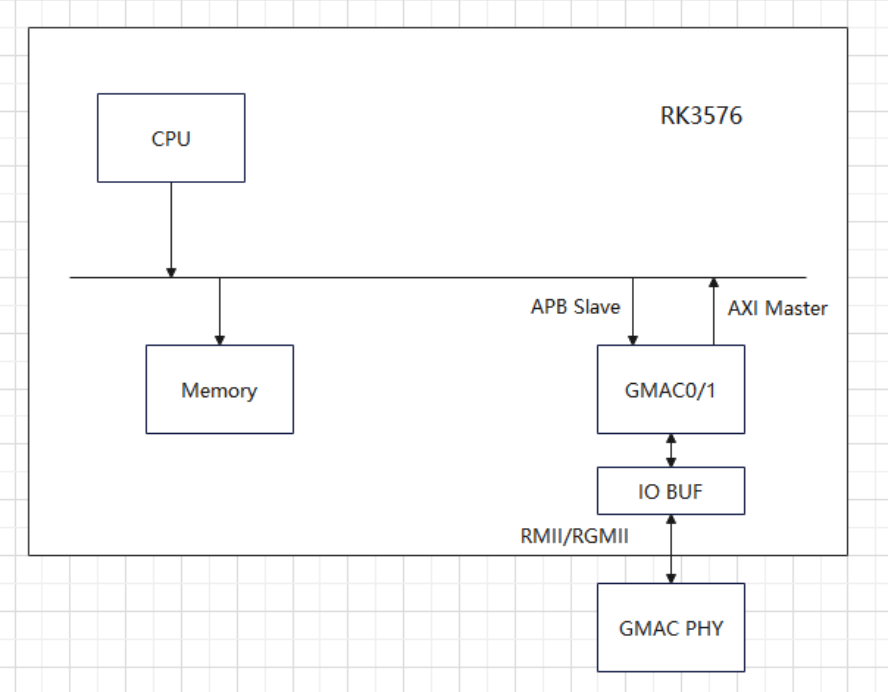

Fig. 8-2 GMAC in SOC

GMAC Supports 10/100/1000-Mbps data transfer rates with the RGMII interfaces and Supports 10/100-Mbps data transfer rates with the RMII interfaces.

8.3 Function Description

8.3.1 Frame Structure

Data frames transmitted shall have the frame format shown in figure below.

Fig. 8-3 Frame Format

The preamble <preamble> begins a frame transmission. The bit value of the preamble field consists of 7 octets with the following bit values:
10101010 10101010 10101010 10101010 10101010 10101010 10101010
The SFD (start frame delimiter) <sfd> indicates the start of a frame and follows the preamble. The bit value is 10101011.The data in a well formed frame shall consist of N octet's data.

8.3.1.1 RMII Interface timing diagram

The Reduced Media Independent Interface (RMII) specification reduces the pin count between Ethernet PHYs and Switch ASICs (only in 10/100 mode). According to the IEEE 802.3u standard, an MII contains 16 pins for data and control. In devices incorporating multiple MAC or PHY interfaces (such as switches), the number of pins adds significant cost with increase in port count. The RMII specification addresses this problem by reducing the pin count to 7 for each port - a 62.5% decrease in pin count.
The RMII module is instantiated between the GMAC and the PHY. This helps translation of the MAC's MII into the RMII. The RMII block has the following characteristics:
Supports 10-Mbps and 100-Mbps operating rates. It does not support 1000-Mbps operation. Two clock references are sourced externally or CRU, providing independent, 2-bit wide transmit and receive paths.

8.3.1.2 Transmit Bit Ordering

Each nibble from the MII must be transmitted on the RMII a di-bit at a time with the order of di-bit transmission shown in figure below. The lower order bits (D1 and D0) are transmitted first followed by higher order bits (D2 and D3).

Copyright © 2024 Rockchip Electronics Co., Ltd.

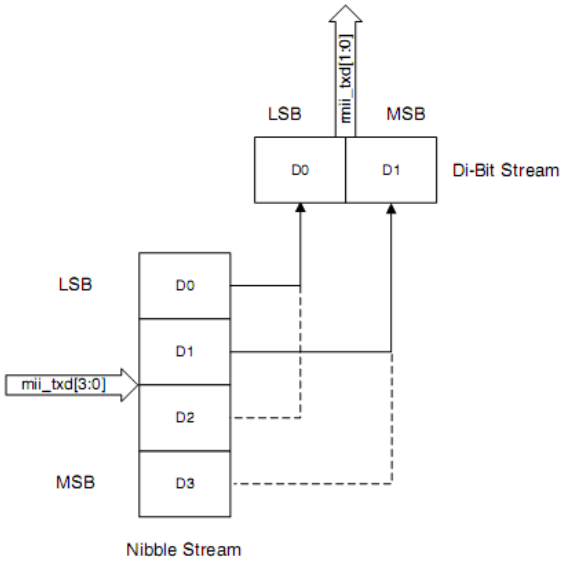

Fig. 8-4 RMII Transmission Bit Ordering

8.3.1.3 RMII Transmit Timing Diagrams

The follow figures show MII-to-RMII transaction timing. The clk_rmii_i (REF_CLK) frequency is 50MHz in RMII interface. In 10Mb/s mode, as the REF_CLK frequency is 10 times as the data rate, the value on rmii_txd_o[1:0] (TXD[1:0]) shall be valid such that TXD[1:0] may be sampled every 10th cycle, regard-less of the starting cycle within the group and yield the correct frame data.

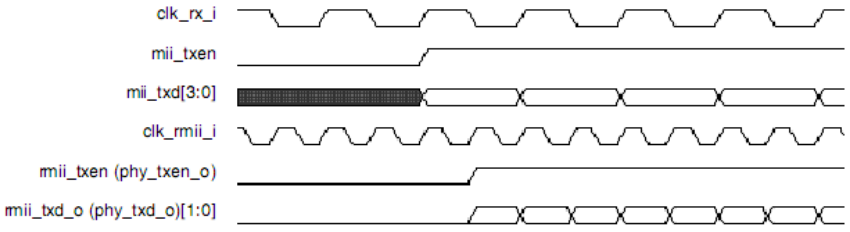

Fig. 8-5 Start of MII and RMII Transmission in 100-Mbps Mode

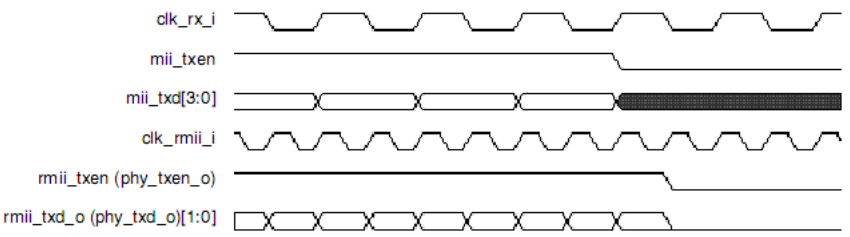

Fig. 8-6 End of MII and RMII Transmission in 100-Mbps Mode

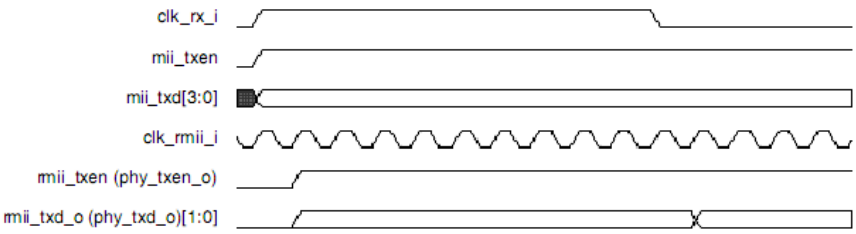

Fig. 8-7 Start of MII and RMII Transmission in 10-Mbps Mode

Copyright © 2024 Rockchip Electronics Co., Ltd.

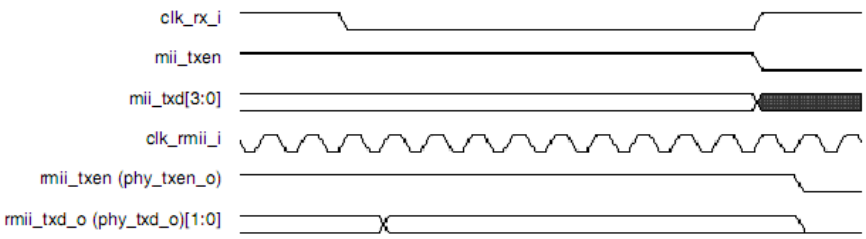

Fig. 8-8 End of MII and RMII Transmission in 10-Mbps Mode

8.3.1.4 Receive Bit Ordering

Each nibble is transmitted to the MII from the di-bit received from the RMII in the nibble transmission order shown in figure below. The lower order bits (D0 and D1) are received first, followed by the higher order bits (D2 and D3).

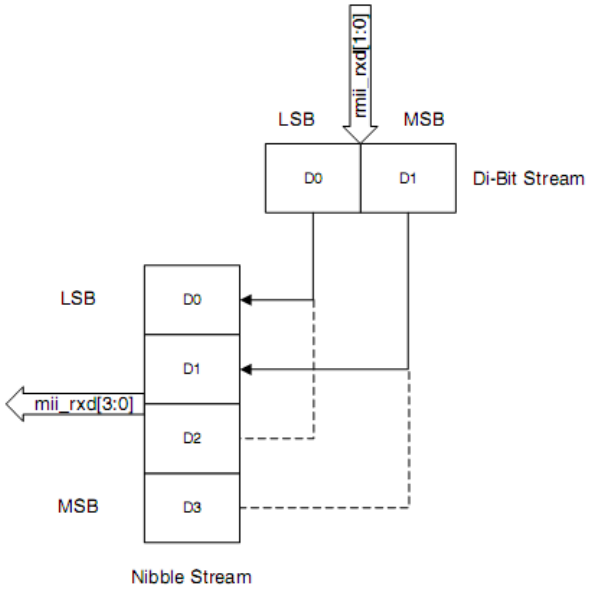

Fig. 8-9 RMII Receive Bit Ordering

8.3.1.5 RGMII Interface

The Reduced Gigabit Media Independent Interface (RGMII) specification reduces the pin count of the interconnection between the GMAC 10/100/1000 controller and the PHY for GMII and MII interfaces. To achieve this, the data path and control signals are reduced and multiplexed together with both the edges of the transmission and receive clocks. For gigabit operation the clocks operate at 125 MHz; for 10/100 operation, the clock rates are 2.5 MHz/25 MHz.

In the GMAC 10/100/1000 controller, the RGMII module is instantiated between the GMAC core's GMII and the PHY to translate the control and data signals between the GMII and RGMII protocols.

The RGMII block has the following characteristics:

- Supports 10-Mbps, 100-Mbps, and 1000-Mbps operation rates
- For the RGMII block, no extra clock is required because both the edges of the incoming clocks are used
- The RGMII block extracts the in-band (link speed, duplex mode and link status) status signals from the PHY and provides them to the GMAC core logic for link detection

8.3.2 Station Management Agent

The application can access the PHY registers through the Station Management Agent (SMA) module. SMA is a two-wire Station Management interface (MIM).

For MIM accesses, the maximum operating frequency of the MDC (gmii_mdc_o) is 2.5 MHz, as specified in the IEEE 802.3. In the GMAC core, the gmii_mdc_o clock is derived from the application clock or clk_csr_i, using a divider-counter. The divide factor depends on the clock range setting (CR field) in the MAC_MDIO_Address register Select the clock divide

Copyright © 2024 Rockchip Electronics Co., Ltd.

factor as mentioned in the description of CR field of MAC_MDIO_Address register, to meet IEEE specifications. However, if your system supports higher clock frequencies on the MIM interface, there is a provision to select a different divider.
The MDIO frame structure is as follows:

Table 8-1 MDIO Clause 45 Frame Structure

Field	Description
IDLE	The mdio line is in tri-state; there is no clock on gmii_mdc_o signal.
PREAMBLE	32 continuous bits of value 1
START	Start of packet is 2'b00
OPCODE	■ 2'b00 ■ 2'b01 ■ 2'b10 ■ 2'b11
PHY ADDR	5-bit address select for one of 32 PHYs
DEV ADDR	5-bit address select for one of 32 devices
TA	Turnaround ■ 2'bZ0: Read and post-read increment address ■ 2'b10: Write and address MDIO accesses Where Z is the tri-state level
DATA/ADDRESS	16-bit value: For an address cycle (OPCODE = 2'b00), this frame contains the address of the register to be accessed on the next cycle. For the data cycle of a write frame, this field contains the data to be written to the register. For read or post-read increment address frames, this field contains the contents of the register read from the PHY. ■ In address and data write cycles, the GMAC drives the MDIO line during the transfer of these 16 bits. ■ In read and post-read increment address cycles, the PHY drives the MDIO line during the transfer of these 16 bits.

The frame structure for Clause 22 frames is also supported. The C45E bit in the MAC_MDIO_Address register can be programmed to enable Clause 22 or Clause 45 mode of operation. Table.1-2 shows the Clause 22 frame format.

Table 8-2 MDIO Clause 22 Frame Structure

Field	Description
IDLE	The mdio line is in tri-state; there is no clock on gmii_mdc_o signal.
PREAMBLE	32 continuous bits of value 1
START	Start of packet is 2'b01
OPCODE	■ 2'b01 : Write ■ 2'b10 : Read
PHY ADDR	5-bit address select for one of 32 PHYs
DEV ADDR	5-bit address to select the register within each MMD
TA	Turnaround ■ 2'bZ0: Read and post-read increment address ■ 2'b10: Write and address MDIO accesses Where Z is the tri-state level
DATA/ADDRESS	Any 16-bit value: ■ In a write operation, the GMAC drives MDIO ■ In read operation, the PHY drives MDIO

In addition to normal read and write operations, the SMA also supports post-read increment address while operating in Clause 45 mode.

8.3.3 Power Management and Energy Efficient Ethernet

The GMAC supports the following techniques to save power.

- Magic Packet
- Remote Wakeup
- Energy Efficient Ethernet

The Magic Packet and Remove Wakeup techniques are used to save power in the host system when it is idle (Sleep mode) and has to be woken up only at the reception of specific packets from the Ethernet network. In the Sleep mode, the power to the host logic along with majority of the GMAC (except the MAC receiver logic), can be shut down. On receiving the specific packets from the network, the MAC provides the trigger to restore the power to the host system and come back to normal state.

The Energy Efficient Ethernet (EEE) mode is compliant with the IEEE 802.3az-2010 standard. It is primarily targeted to save power in the Ethernet port when there is no traffic on the line. In this mode, the host indicates to the far-end that it does not have any packets to transmit for near future and puts the transmitter port (MAC Controller, PCS and PHY layers) into low-power mode. Similarly, the Receiver port can also be put into low-power mode when the far-end host indicates that it does not have any traffic to transfer. This allows significant saving of power in the Ethernet port (mainly in the PHY) with intermittent and bursty traffic profile. The triggering of entry and exit out of the EEE mode is controlled by the MAC and is supported within the GMAC.

Simultaneous operation of the EEE mode along with any or both the other power saving modes is also supported in GMAC.

8.3.4 IEEE 1588 Timestamp Support

The IEEE 1588 defines a Precision Time Protocol (PTP) which enables precise synchronization of time in measurement and control systems. This protocol enables heterogeneous systems that include clocks of varying inherent precision, resolution, and stability to synchronize. The protocol supports system-wide synchronization accuracy in the sub-microsecond range with minimal network and local clock computing resources.

The GMAC supports the IEEE 1588-2002 (version 1) and IEEE 1588-2008 (version 2). The IEEE 1588-2002 supports PTP transported over UDP/IP and IEEE 1588-2008 supports PTP transported over Ethernet. The GMAC provides programmable support for both standards. The controller supports the following features:

- Provides an option to take snapshot of all packets or only PTP type packets
- Provides an option to take snapshot of only event messages
- Provides an option to take the snapshot based on the clock type: ordinary, boundary, end-to-end transparent, and peer-to-peer transparent
- Provides an option to select the node to be a master or slave for ordinary and boundary clock
- Identifies the PTP message type, version, and PTP payload in packets sent directly over Ethernet and sends the status
- Provides an option to measure sub-second time in digital or binary format

8.3.5 TCP/IP Segmentation Offload (TSO) Engine

The TCP Segmentation Offload (TSO) engine is useful in offloading the TCP segmentation functions to the hardware.

It also supports UDP Segmentation Offload (USO) in which the UDP payload is segmented in the hardware. There are no sequencing/ordering controls available or updated in the segments, so it can be used in point to point applications in which out of order packets are not expected by the receiver. The description and flow of TSO mentioned in this section is same as USO, any deviation is provided as notes.

In the TCP segmentation offload (TSO) feature, the DMA splits a large TCP packet into multiple small packets and passes these packets to the MTL Tx Queue.

8.3.6 MAC Management Counters

The GMAC supports storing the statistics about the received and transmitted packets in registers that are accessible through the application.

The counters in the MAC Management Counters (MMC) module can be viewed as an

Copyright © 2024 Rockchip Electronics Co., Ltd.

extension of the register address space of the CSR module. The MMC module maintains a set of registers for gathering statistics on the received and transmitted packets. The register set includes a control register for controlling the behavior of the registers, two status registers containing interrupts generated (receive and transmit), and Interrupt Enable registers (receive and transmit). These registers are accessible from the Application through the MAC Control Interface (MCI). Each register is 32-bits wide. The write data is qualified with the corresponding mci_be_i signals. Therefore, non-32-bit accesses are allowed as long as the address is word-aligned. The MMCs are accessed using transactions, in the same way the CSR address space is accessed.
The MMC counters are free running. There is no separate enable for the counters to start. If a particular MMC counter is present in the RTL, it starts counting when corresponding packet is received or transmitted. The Receive MMC counters are updated for packets that are passed by the Address Filter (AFM) block. The statistics of packets, dropped by the AFM module, are not updated unless they are runt packets of less than 6 bytes (DA bytes are not received fully). To get statistics of all packets, set Bit 0 in the “MAC_Packet_Filter” register.
The MMC module gathers statistics on encapsulated IPv4, IPv6, TCP, UDP, or ICMP payloads in received Ethernet packets.

8.4 Register Description

8.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

Operational Base

Name	Base Address
GMAC0	0x2A220000
GMAC1	0x2A230000

8.4.2 Registers Summary

Name	Offset	Size	Reset Value	Description
GMAC_MAC_CONFIGURATION	0x0000	W	0x00000000	The MAC Configuration Register establishes the operating mode of the MAC
GMAC_MAC_EXT_CONFIGURATION	0x0004	W	0x00000000	The MAC Extended Configuration Register establishes the operating mode of the MAC
GMAC_MAC_PACKET_FILTER	0x0008	W	0x00000000	The MAC Packet Filter register contains the filter controls for receiving packets
GMAC_MAC_WATCHDOG_TIMEOUT	0x000C	W	0x00000000	The Watchdog Timeout register controls the watchdog timeout for received packets
GMAC_MAC_HASH_TABLE_REG0	0x0010	W	0x00000000	The Hash Table Register 0 contains the first 32 bits of the hash table
GMAC_MAC_HASH_TABLE_REG1	0x0014	W	0x00000000	The Hash Table Register 1 contains the second 32 bits of the hash table
GMAC_MAC_HASH_TABLE_REG2	0x0018	W	0x00000000	The Hash Table Register 2 contains the third 32 bits of the hash table

Copyright © 2024 Rockchip Electronics Co., Ltd.

Name	Offset	Size	Reset Value	Description
GMAC_MAC_VLAN_TAG_CTRL	0x0050	W	0x00000000	This register is the redefined format of the MAC VLAN Tag Register. It is used for indirect addressing. It contains the address offset, command type and Busy Bit for CSR access of the Per VLAN Tag registers
GMAC_MAC_VLAN_TAG_DATA	0x0054	W	0x00000000	This register holds the read/write data for Indirect Access of the Per VLAN Tag registers.During the read access, this field contains valid read data only after the OB bit is reset. During the write access, this field should be valid prior to setting the OB bit in the MAC_VLAN_Tag_Ctrl Register
GMAC_MAC_VLAN_HASH_TABLE	0x0058	W	0x00000000	When VTHM bit of the MAC_VLAN_Tag register is set, the 16-bit VLAN Hash Table register is used for group address filtering based on the VLAN tag
GMAC_MAC_VLAN_INCL	0x0060	W	0x00000000	The VLAN Tag Inclusion or Replacement register contains the VLAN tag for insertion or replacement in the Transmit packets. It also contains the VLAN tag insertion controls
GMAC_MAC_INNER_VLAN_INCL	0x0064	W	0x00000000	The Inner VLAN Tag Inclusion or Replacement register contains the inner VLAN tag to be inserted or replaced in the Transmit packet. It also contains the inner VLAN tag insertion controls
GMAC_MAC_Q0_TX_FLOW_CTRL	0x0070	W	0x00000000	The Flow Control register controls the generation and reception of the Control (Pause Command) packets by the Flow control module of the MAC
GMAC_MAC_RX_FLOW_CTRL	0x0090	W	0x00000000	The Receive Flow Control register controls the pausing of MAC Transmit based on the received Pause packet
GMAC_MAC_RXQ_CTRL4	0x0094	W	0x00000000	The Receive Queue Control 4 register controls the routing of unicast and multicast packets that fail the Destination or Source address filter to the Rx queues
GMAC_MAC_RXQ_CTRL0	0x00A0	W	0x00000000	The Receive Queue Control 0 register controls the queue management in the MAC Receiver
GMAC_MAC_RXQ_CTRL1	0x00A4	W	0x00000000	The Receive Queue Control 1 register controls the routing of multicast, broadcast, AV, DCB, and untagged packets to the Rx queues

Copyright © 2024 Rockchip Electronics Co., Ltd.

Name	Offset	Size	Reset Value	Description
GMAC_MAC_RXQ_CTRL2	0x00A8	W	0x00000000	This register controls the routing of tagged packets based on the USP (user Priority) field of the received packets to the RxQueues 0 to 3
GMAC_MAC_INTERRUPT_STATUS	0x00B0	W	0x00000000	The Interrupt Status register contains the status of interrupts
GMAC_MAC_INTERRUPT_ENABLE	0x00B4	W	0x00000000	The Interrupt Enable register contains the masks for generating the interrupts
GMAC_MAC_RX_TX_STATUS	0x00B8	W	0x00000000	The Receive Transmit Status register contains the Receive and Transmit Error status
GMAC_MAC_PMT_CONTROL_STATUS	0x00C0	W	0x00000000	The PMT Control and Status Register
GMAC_MAC_RWK_PACKET_FILTER	0x00C4	W	0x00000000	The Remote Wakeup Filter registers are implemented as 8, 16, or 32 indirect access registers (wkuppktfilter_reg#i) based on whether 4, 8, or 16 Remote Wakeup Filters are selected in the configuration and accessed by application through MAC_RWK_Packet_Filter register
GMAC_RWK_FILTER0_BYTE_MASK	0x00C4	W	0x00000000	RWK Filter0 Byte Mask
GMAC_RWK_FILTER1_BYTE_MASK	0x00C4	W	0x00000000	RWK Filter1 Byte Mask
GMAC_RWK_FILTER2_BYTE_MASK	0x00C4	W	0x00000000	RWK Filter2 Byte Mask
GMAC_RWK_FILTER3_BYTE_MASK	0x00C4	W	0x00000000	RWK Filter3 Byte Mask
GMAC_RWK_FILTER01_CRC	0x00C4	W	0x00000000	RWK Filter 0/1 CRC-16
GMAC_RWK_FILTER23_CRC	0x00C4	W	0x00000000	RWK Filter 2/3 CRC-16
GMAC_RWK_FILTER_OFFSET	0x00C4	W	0x00000000	RWK Filter Offset
GMAC_RWK_FILTER_COMMAND	0x00C4	W	0x00000000	RWK Filter Command
GMAC_MAC_LPI_CONTROL_STATUS	0x00D0	W	0x00000000	The LPI Control and Status Register controls the LPI functions and provides the LPI interrupt status. The status bits are cleared when this register is read
GMAC_MAC_LPI_TIMERS_CONTROL	0x00D4	W	0x03E80000	The LPI Timers Control register controls the timeout values in the LPI states.
GMAC_MAC_LPI_ENTRY_TIMER	0x00D8	W	0x00000000	This register controls the Tx LPI entry timer
GMAC_MAC_1US_TIC_COUNTER	0x00DC	W	0x0000003F	This register controls the generation of the Reference time (1 microsecond tic)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Name	Offset	Size	Reset Value	Description
GMAC_MAC_PHYIF_CONTROL_STATUS	0x00F8	W	0x00000000	PHY Interface Control and Status Register
GMAC_MAC_VERSION	0x0110	W	0x00003051	The version register identifies the version of the DWC_ether_qos
GMAC_MAC_DEBUG	0x0114	W	0x00000000	The Debug register provides the debug status of various MAC blocks
GMAC_MAC_HW_FEATURE0	0x011C	W	0x181173F3	This register indicates the presence of first set of the optional features or functions
GMAC_MAC_HW_FEATURE1	0x0120	W	0x111E41E8	This register indicates the presence of second set of the optional features or functions

GMAC_MAC_MDIO_ADDRESS	0x0200	W	0x00000000	The MDIO Address register controls the management cycles to external PHY through a management interface
GMAC_MAC_MDIO_DATA	0x0204	W	0x00000000	The MDIO Data register stores the Write data to be written to the PHY register located at the address specified in MAC_MDIO_Address
GMAC_MAC_ARP_ADDRESS	0x0210	W	0x00000000	The ARP Address register contains the IPv4 Destination Address of the MAC
GMAC_MAC_CSR_SW_CTRL	0x0230	W	0x00000000	This register contains SW programmable controls for changing the CSR access response and status bits clearing
GMAC_MAC_FPE_CTRL_STS	0x0234	W	0x00000000	This register controls the operation of Frame Preemption
GMAC_MAC_EXT_CFG1	0x0238	W	0x00000000	This register contains Split mode control field and offset field for Split Header feature
GMAC_MAC_PRESN_TIME_NS	0x0240	W	0x00000000	This register contains the 32-bit binary rollover equivalent time of the PTP System Time in ns
GMAC_MAC_PRESN_TIME_UPDT	0x0244	W	0x00000000	This field holds the 32-bit value of MAC 1722 Presentation Time in ns, that should be added to the Current Presentation Time Counter value. Init happens when TSINIT is set, and update happens when the TSUPDT bit is set (TSINIT and TSINIT defined in MAC_Timestamp_ Control register

Name	Offset	Size	Reset Value	Description
GMAC_MAC_ADDRESS0_HIGH	0x0300	W	0x0000FFFF	The MAC Address0 High register holds the upper 16 bits of the first 6-byte MAC address of the station
GMAC_MAC_ADDRESS0_LOW	0x0304	W	0xFFFFFFFF	The MAC Address0 Low register holds the lower 32 bits of the 6-byte first MAC address of the station
GMAC_MMC_CONTROL	0x0700	W	0x00000000	This register establishes the operating mode of MMC
GMAC_MMC_RX_INTERRUPT	0x0704	W	0x00000000	Maintains the interrupts generated from all Receive statistics counters
GMAC_MMC_TX_INTERRUPT	0x0708	W	0x00000000	Maintains the interrupts generated from all Transmit statistics counters
GMAC_MMC_RX_INTERRUPT_MASK	0x070C	W	0x00000000	This register maintains the masks for interrupts generated from all Receive statistics counters
GMAC_MMC_TX_INTERRUPT_MASK	0x0710	W	0x00000000	This register maintains the masks for interrupts generated from all Transmit statistics counters
GMAC_TX_OCTET_COUNT_GOOD_BAD	0x0714	W	0x00000000	This register provides the number of bytes transmitted by the DWC_ether_qos, exclusive of preamble and retried bytes, in good and bad packets
GMAC_TX_PACKET_COUNT_GOOD_BAD	0x0718	W	0x00000000	This register provides the number of good and bad packets, exclusive of retried packets
GMAC_TX_UNDERFLOW_ERROR_PACKETS	0x0748	W	0x00000000	This register provides the number of packets aborted because of packets underflow error
GMAC_TX_CARRIER_ERROR_PACKETS	0x0760	W	0x00000000	This register provides the number of packets aborted because of carrier sense error (no carrier or loss of carrier)
GMAC_TX_OCTET_COUNT_GOOD	0x0764	W	0x00000000	This register provides the number of bytes exclusive of preamble, only in good packets
GMAC_TX_PACKET_COUNT_GOOD	0x0768	W	0x00000000	This register provides the number of good packets transmitted by DWC_ether_qos
GMAC_TX_PAUSE_PACKETS	0x0770	W	0x00000000	This register provides the number of good Pause packets transmitted by DWC_ether_qos
GMAC_RX_PACKETS_COUNT_GOOD_BAD	0x0780	W	0x00000000	This register provides the number of good and bad packets received by DWC_ether_qos
GMAC_RX_OCTET_COUNT_GOOD_BAD	0x0784	W	0x00000000	This register provides the number of bytes received by DWC_ether_qos, exclusive of preamble, in good and bad packets

Name	Offset	Size	Reset Value	Description
GMAC_MAC_LAYER3_ADDR0_REG0	0x0910	W	0x00000000	For IPv4 packets, the Layer 3 Address 0 Register 0 register contains the 32-bit IP Source Address field. For IPv6 packets, it contains Bits[31:0] of the 128-bit IP Source Address or Destination Address field
GMAC_MAC_LAYER3_ADDR1_REG0	0x0914	W	0x00000000	For IPv4 packets, the Layer 3 Address 1 Register 0 register contains the 32-bit IP Destination Address field. For IPv6 packets, it contains Bits[63:32] of the 128-bit IP Source Address or Destination Address field
GMAC_MAC_LAYER3_ADDR2_REG0	0x0918	W	0x00000000	The Layer 3 Address 2 Register 0 register is reserved for IPv4 packets. For IPv6 packets, it contains Bits[95:64] of 128-bit IP Source Address or Destination Address field
GMAC_MAC_LAYER3_ADDR3_REG0	0x091C	W	0x00000000	The Layer 3 Address 3 Register 0 register is reserved for IPv4 packets. For IPv6 packets, it contains Bits[127:96] of 128-bit IP Source Address or Destination Address field
GMAC_MAC_TIMESTAMP_CONTROL	0x0B00	W	0x00000000	This register controls the operation of the System Time generator and processing of PTP packets for timestamping in the Receiver
GMAC_MAC_SUB_SECOND_INCREMENT	0x0B04	W	0x00000000	Specifies the value to be added to the internal system time register every cycle of clk_ptp_ref_i clock
GMAC_MAC_SYSTEM_TIME_SECS	0x0B08	W	0x00000000	The System Time Nanoseconds register, along with System Time Seconds register, indicates the current value of the system time maintained by the MAC
GMAC_MAC_SYSTEM_TIME_NS	0x0B0C	W	0x00000000	The System Time Nanoseconds register, along with System Time Seconds register, indicates the current value of the system time maintained by the MAC
GMAC_MAC_SYS_TIME_SECS_UPDATE	0x0B10	W	0x00000000	The System Time Seconds Update register, along with the System Time Nanoseconds Update register, initializes or updates the system time maintained by the MAC
GMAC_MAC_SYS_TIME_NS_UPDATE	0x0B14	W	0x00000000	MAC System Time Nanoseconds Update register

Copyright © 2024 Rockchip Electronics Co., Ltd.

Name	Offset	Size	Reset Value	Description
GMAC_MAC_TIMESTAMP_ADDEND	0x0B18	W	0x00000000	Timestamp Addend register. This register value is used only when the system time is configured for Fine Update mode (TSCFUPDT bit in the MAC_Timestamp_Control register)
GMAC_MAC_TIMESTAMP_STATUS	0x0B20	W	0x00000000	Timestamp Status register. All bits except Bits[27:25] gets cleared when the application reads this register
GMAC_MAC_TX_TS_STATUS_NS	0x0B30	W	0x00000000	This register contains the nanosecond part of timestamp captured for Transmit packets when Tx status is disabled
GMAC_MAC_TX_TS_STATUS_SECS	0x0B34	W	0x00000000	The register contains the higher 32 bits of the timestamp (in seconds) captured when a PTP packet is transmitted
GMAC_MAC_AUXILIARY_CONTROL	0x0B40	W	0x00000000	The Auxiliary Timestamp Control register controls the Auxiliary Timestamp snapshot
GMAC_MAC_AUXILIARY_TS_NS	0x0B48	W	0x00000000	The Auxiliary Timestamp Nanoseconds register, along with MAC_Auxiliary_Timestamp_Seconds, gives the 64-bit timestamp stored as auxiliary snapshot
GMAC_MAC_AUXILIARY_TS_SECS	0x0B4C	W	0x00000000	The Auxiliary Timestamp - Seconds register contains the lower 32 bits of the Seconds field of the auxiliary timestamp register
GMAC_MAC_TS_INGRESS_CORR_NS	0x0B58	W	0x00000000	This register contains the correction value in nanoseconds to be used with the captured timestamp value in the ingress path
GMAC_MAC_TS_EGRESS_CORR_NS	0x0B5C	W	0x00000000	This register contains the correction value in nanoseconds to be used with the captured timestamp value in the egress path
GMAC_MAC_TS_INGRESS_LATENCY	0x0B68	W	0x00000000	This register holds the Ingress MAC latency
GMAC_MAC_TS_EGRESS_LATENCY	0x0B6C	W	0x00000000	This register holds the Egress MAC latency
GMAC_MAC_PPS_CONTROL	0x0B70	W	0x00000000	PPS Control register

Copyright © 2024 Rockchip Electronics Co., Ltd.

Name	Offset	Size	Reset Value	Description
GMAC_MAC_PPS0_TARGET_TIME_SECONDS	0x0B80	W	0x00000000	The PPS Target Time Seconds register, along with PPS Target Time Nanoseconds register, is used to schedule an interrupt event [Bit 1 of MAC_Timestamp_Status] when the system time exceeds the value programmed in these registers
GMAC_MAC_PPS0_TARGET_TIME_NS	0x0B84	W	0x00000000	PPS0 Target Time Nanoseconds register
GMAC_MAC_PPS0_INTERVAL	0x0B88	W	0x00000000	The PPS0 Interval register contains the number of units of sub-second increment value between the rising edges of PPS0 signal output (ptp_pps_o[0])
GMAC_MAC_PPS0_WIDTH	0x0B8C	W	0x00000000	The PPS0 Width register contains the number of units of sub-second increment value
GMAC_MTL_OPERATION_MODE	0x0C00	W	0x00000000	The Operation Mode register establishes the Transmit and Receive operating modes and commands
GMAC_MTL_DBG_CTL	0x0C08	W	0x00000000	The FIFO Debug Access Control and Status register controls the operation mode of FIFO debug access
GMAC_MTL_DBG_STS	0x0C0C	W	0x01900000	The FIFO Debug Status register contains the status of FIFO debug access
GMAC_MTL_FIFO_DEBUG_DATA	0x0C10	W	0x00000000	The FIFO Debug Data register contains the data to be written to or read from the FIFOs
GMAC_MTL_INTERRUPT_STATUS	0x0C20	W	0x00000000	The software driver (application) reads this register during interrupt service routine or polling to determine the interrupt status of MTL queues and the MAC
GMAC_MTL_RXQ_DMA_MAP0	0x0C30	W	0x00000000	The Receive Queue and DMA Channel Mapping 0 register is reserved in EQOS-CORE and EQOS-MTL configurations
GMAC_MTL_TBS_CTRL	0x0C40	W	0x00000000	This register controls the operation of Time Based Scheduling
GMAC_MTL_EST_CONTROL	0x0C50	W	0x00000000	This register controls the operation of Enhancements to Scheduled Transmission (IEEE802.1Qbv)
GMAC_MTL_EST_STATUS	0x0C58	W	0x00000000	This register provides Status related to Enhancements to Scheduled Transmission

Copyright © 2024 Rockchip Electronics Co., Ltd.

Name	Offset	Size	Reset Value	Description
GMAC_MTL_EST_SCH_ERROR	0x0C60	W	0x00000000	This register provides the One Hot encoded Queue Numbers that are having the Scheduling related error (timeout)
GMAC_MTL_EST_FRM_SIZE_ERROR	0x0C64	W	0x00000000	This register provides the One Hot encoded Queue Numbers that are having the Frame
GMAC_MTL_EST_FRM_SIZE_CAPTURE	0x0C68	W	0x00000000	This register captures the Frame Size and Queue Number of the first occurrence of the Frame Size related error. Up on clearing it captures the data of immediate next occurrence of a similar error
GMAC_MTL_EST_INTR_ENABLE	0x0C70	W	0x00000000	This register implements the Interrupt Enable bits for the various events that generate an interrupt. Bit positions have a 1 to 1 correlation with the status bit positions in MTL_ETS_Status
GMAC_MTL_EST_GCL_CONTROL	0x0C80	W	0x00000000	This register provides the control information for reading/writing to the Gate Control lists
GMAC_MTL_EST_GCL_DATA	0x0C84	W	0x00000000	This register holds the read data or write data in case of reads and writes respectively
GMAC_MTL_FPE_CTRL_STS	0x0C90	W	0x00000000	This register controls the operation of, and provides status for Frame Preemption (IEEE802.1Qbu/802.3br)
GMAC_MTL_FPE_ADVANCE	0x0C94	W	0x00000000	This register holds the Hold and Release Advance time
GMAC_MTL_TXQ0_OPERATION_MODE	0x0D00	W	0x00060000	The Queue 0 Transmit Operation Mode register establishes the Transmit queue operating modes and commands
GMAC_MTL_TXQ0_UNDERFLOW	0x0D04	W	0x00000000	The Queue 0 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush
GMAC_MTL_TXQ0_DEBUG	0x0D08	W	0x00000000	The Queue 0 Transmit Debug register gives the debug status of various blocks related to the Transmit queue
GMAC_MTL_TXQ0_ETS_STATUS	0x0D14	W	0x00000000	The Queue 0 ETS Status register provides the average traffic transmitted in Queue 0
GMAC_MTL_TXQ0_QUANTUM_WEIGHT	0x0D18	W	0x00000000	The Queue 0 Quantum or Weights register contains the quantum value for Deficit Weighted Round Robin (DWRR), weights for the Weighted Round Robin (WRR), and Weighted Fair Queuing (WFQ) for Queue 0

Name	Offset	Size	Reset Value	Description
GMAC_MTL_Q0_INTERRUPT_CTRL_STATUS	0x0D2C	W	0x00000000	This register contains the interrupt enable and status bits for the queue 0 interrupts
GMAC_MTL_RXQ0_OPERATION_MODE	0x0D30	W	0x00000000	The Queue 0 Receive Operation Mode register establishes the Receive queue operating modes and command
GMAC_MTL_RXQ0_MISS_PKT_OVF_CNT	0x0D34	W	0x00000000	The Queue 0 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow
GMAC_MTL_RXQ0_DEBUG	0x0D38	W	0x00000000	The Queue 0 Receive Debug register gives the debug status of various blocks related to the Receive queue
GMAC_MTL_RXQ0_CONTROL	0x0D3C	W	0x00000000	The Queue Receive Control register controls the receive arbitration and passing of received packets to the application
GMAC_DMA_MODE	0x1000	W	0x00000000	The Bus Mode register establishes the bus operating modes for the DMA
GMAC_DMA_SYSBUS_MODE	0x1004	W	0x00010000	The System Bus mode register controls the behavior of the AHB or AXI master
GMAC_DMA_INTERRUPT_STATUS	0x1008	W	0x00000000	The application reads this Interrupt Status register during interrupt service routine or polling to determine the interrupt status of DMA channels, MTL queues, and the MAC
GMAC_DMA_DEBUG_STATUS0	0x100C	W	0x00000000	The Debug Status 0 register gives the Receive and Transmit process status for DMA Channel 0-Channel 2 for debugging purpose
GMAC_AXI_LPI_ENTRY_INTERVAL	0x1040	W	0x00000000	This register is used to control the AXI LPI entry interval
GMAC_DMA_TBS_CTRL	0x1050	W	0x00000000	This register is used to control the TBS attributes
GMAC_DMA_CH0_CONTROL	0x1100	W	0x00000000	The register specifies the MSS value for segmentation, length to skip between two descriptors, and 8xPBL mode
GMAC_DMA_CH0_TX_CONTROL	0x1104	W	0x00000000	The register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights
GMAC_DMA_CH0_RX_CONTROL	0x1108	W	0x00000000	The DMA Channel0 Receive Control register controls the Rx features such as PBL, buffer size, and extended status

Copyright © 2024 Rockchip Electronics Co., Ltd.

Name	Offset	Size	Reset Value	Description
GMAC_DMA_CH0_TXDESC_LIST_HADDRESS	0x1110	W	0x00000000	The Channel0 Tx Descriptor List HAddress register has the higher 8 or 16 bits of the start
GMAC_DMA_CH0_TXDESC_LIST_ADDRESS	0x1114	W	0x00000000	The Channel0 Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list
GMAC_DMA_CH0_RXDESC_LIST_HADDRESS	0x1118	W	0x00000000	The Channel0 Rx Descriptor List HAddress register has the higher 8 or 16 bits of the start
GMAC_DMA_CH0_RXDESC_LIST_ADDRESS	0x111C	W	0x00000000	The Channel0 Rx Descriptor List Address register points the DMA to the start of Receive descriptor list
GMAC_DMA_CH0_TXDESC_TAIL_POINTER	0x1120	W	0x00000000	The Channel0 Tx Descriptor Tail Pointer register points to an offset from the base and indicates the location of the last valid descriptor
GMAC_DMA_CH0_RXDESC_TAIL_POINTER	0x1128	W	0x00000000	The Channel0 Rx Descriptor Tail Pointer Points to an offset from the base and indicates the location of the last valid descriptor
GMAC_DMA_CH0_TXDESC_RING_LENGTH	0x112C	W	0x00000000	The Tx Descriptor Ring Length register contains the length of the Transmit descriptor ring
GMAC_DMA_CH0_RXDESC_RING_LENGTH	0x1130	W	0x00000000	The Channel0 Rx Descriptor Ring Length register contains the length of the Receive descriptor circular ring
GMAC_DMA_CH0_INTERRUPT_ENABLE	0x1134	W	0x00000000	The Channel0 Interrupt Enable register enables the interrupts reported by the Status register
GMAC_DMA_CH0_RX_INTERRUPT_WD_TIMER	0x1138	W	0x00000000	The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA
GMAC_DMA_CH0_SLOT_FUNC_CTRL_STATUS	0x113C	W	0x000007C0	The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path
GMAC_DMA_CH0_CURRENT_APP_TXDESC	0x1144	W	0x00000000	The Channel0 Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA
GMAC_DMA_CH0_CURRENT_APP_RXDESC	0x114C	W	0x00000000	The Channel0 Current Application Receive Descriptor register points to the current Receive descriptor read by the DMA
GMAC_DMA_CH0_CURRENT_APP_TXBUFFER_H	0x1150	W	0x00000000	The Channel0 Current Application Transmit Buffer Address High register has the higher 8 or 16 bits of the current address of the Transmit buffer address read by the DMA

Copyright © 2024 Rockchip Electronics Co., Ltd.

Name	Offset	Size	Reset Value	Description
GMAC_DMA_CH0_CURRENT_APP_TXBUFFER	0x1154	W	0x00000000	The Channel0 Current Application Transmit Buffer Address register points to the current Tx buffer address read by the DMA
GMAC_DMA_CH0_CURRENT_APP_RXBUFFER_H	0x1158	W	0x00000000	The Channel0 Current Application Receive Buffer Address High register has the higher 8 or 16 bits of the current address of the Receive buffer address read by the DMA
GMAC_DMA_CH0_CURRENT_APP_RXBUFFER	0x115C	W	0x00000000	The Channel0 Current Application Receive Buffer Address register points to the current Rx buffer address read by the DMA
GMAC_DMA_CH0_STATUS	0x1160	W	0x00000000	The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA
GMAC_DMA_CH0_MISS_FRAME_CNT	0x1164	W	0x00000000	This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH0_Rx_Control register
GMAC_DMA_CH0_RX_ERI_CNT	0x1168	W	0x00000000	The DMA_CH0_RX_ERI_Cnt registers provides the count of the number of times ERI was asserted
GMAC_MAC_ADDRESS1_HIGH	0x0308	W	0x0000FFFF	The MAC Address1 High register holds the upper 16 bits of the first 6-byte MAC address of the station
GMAC_MAC_ADDRESS1_LOW	0x030C	W	0xFFFFFFFF	The MAC Address0 Low register holds the lower 32 bits of the 6-byte first MAC address of the station
GMAC_MAC_ADDRESS2_HIGH	0x0310	W	0x0000FFFF	The MAC Address2 High register holds the upper 16 bits of the first 6-byte MAC address of the station
GMAC_MAC_ADDRESS2_LOW	0x0314	W	0xFFFFFFFF	The MAC Address0 Low register holds the lower 32 bits of the 6-byte first MAC address of the station
GMAC_MAC_ADDRESS3_HIGH	0x0318	W	0x0000FFFF	The MAC Address3 High register holds the upper 16 bits of the first 6-byte MAC address of the station
GMAC_MAC_ADDRESS3_LOW	0x031C	W	0xFFFFFFFF	The MAC Address0 Low register holds the lower 32 bits of the 6-byte first MAC address of the station
GMAC_MAC_L3_L4_CONTROL1	0x0930	W	0x00000000	The Layer 3 and Layer 4 Control register controls the operations of filter 0 of Layer 3 and Layer 4

8.4.3 Detail Registers Description

GMAC_MAC_CONFIGURATION

Address: **Operational Base** + offset (0x0000)

Bit	Attr	Reset Value	Description
31	RW	0x0	ARPEN ARP Offload Enable When this bit is set, the MAC can recognize an incoming ARP request packet and schedules the ARP packet for transmission. It forwards the ARP packet to the application and also indicate the events in the RxStatus. When this bit is reset, the MAC receiver does not recognize any ARP packet and indicates them as Type frame in the RxStatus. This bit is available only when the Enable IPv4 ARP Offload is selected. Values: 1'b0: ARP Offload is disabled 1'b1: ARP Offload is enabled

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
30:28	RW	0x0	SARC Source Address Insertion or Replacement Control This field controls the source address insertion or replacement for all transmitted packets. Bit 30 specifies which MAC Address register (0 or 1) is used for source address insertion or replacement based on the values of Bits[29:28]: 2'b0x: The mti_sa_ctrl_i and ati_sa_ctrl_i input signals control the SA field generation. 2'b10: 1.If Bit 30 is set to 0, the MAC inserts the content of the MAC Address 0 registers in the SA field of all transmitted packets. 2.If Bit 30 is set to 1 and the Enable MAC Address Register 1 option is selected while configuring the core, the MAC inserts the content of the MAC Address 1 registers in the SA field of all transmitted packets. 2'b11: 1.If Bit 30 is set to 0, the MAC replaces the content of the MAC Address 0 registers in the SA field of all transmitted packets. 2.If Bit 30 is set to 1 and the MAC Address Register 1 is enabled, the MAC replaces the content of the MAC Address 1 registers in the SA field of all transmitted packets. Note: Changes to this field take effect only on the start of a packet. If you write to this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value. 0x0 (SA_CTRL_IN): mti_sa_ctrl_i and ati_sa_ctrl_i input signals control the SA field generation 0x2 (MAC0_INS_SA): Contents of MAC Addr-0 inserted in SA field 0x3 (MAC0_REP_SA): Contents of MAC Addr-0 replaces SA field 0x6 (MAC1_INS_SA): Contents of MAC Addr-1 inserted in SA field 0x7 (MAC1_REP_SA): Contents of MAC Addr-1 replaces SA field
27	RW	0x0	IPC Checksum Offload When set, this bit enables the IPv4 header checksum checking and IPv4 or IPv6 TCP, UDP, or ICMP payload checksum checking. When this bit is reset, the COE function in the receiver is disabled.The Layer 3 and Layer 4 Packet Filter and Enable Split Header features automatically selects the IPC Full Checksum Offload Engine on the Receive side. When any of these features are enabled, you must set the IPC bit. Values: 1'b0: IP header/payload checksum checking is disabled 1'b1: IP header/payload checksum checking is enabled

Bit	Attr	Reset Value	Description
26:24	RW	0x0	IPG Inter-Packet Gap These bits control the minimum IPG between packets during transmission. This range of minimum IPG is valid in full-duplex mode.In the half-duplex mode, the minimum IPG can be configured only for 64-bit times (IPG = 100). Lower values are not considered. When a JAM pattern is being transmitted because of backpressure activation, the MAC does not consider the minimum IPG.The above function (IPG less than 96 bit times) is valid only when EIPGEN bit in MAC_Ext_Configuration register is reset. When EIPGEN is set, then the minimum IPG (greater than 96 bit times) is controlled as per the description given in EIPG field in MAC_Ext_Configuration register. Values: 3'b000: 96 bit times IPG 3'b001: 88 bit times IPG 3'b010: 80 bit times IPG 3'b011: 72 bit times IPG 3'b100: 64 bit times IPG 3'b101: 56 bit times IPG 3'b110: 48 bit times IPG 3'b111: 40 bit times IPG
23	RW	0x0	GPSLCE Giant Packet Size Limit Control Enable When this bit is set, the MAC considers the value in GPSL field in MAC_Ext_Configuration register to declare a received packet as Giant packet. This field must be programmed to more than 1,518 bytes. Otherwise, the MAC considers 1,518 bytes as giant packet limit. When this bit is reset, the MAC considers a received packet as Giant packet when its size is greater than 1,518 bytes (1522 bytes for tagged packet).The watchdog timeout limit, Jumbo Packet Enable and 2K Packet Enable have higher precedence over this bit, that is the MAC considers a received packet as Giant packet when its size is greater than 9,018 bytes (9,022 bytes for tagged packet) with Jumbo Packet Enabled and greater than 2,000 bytes with 2K Packet Enabled. The watchdog timeout, if enabled, terminates the received packet when watchdog limit is reached. Therefore, the programmed giant packet limit should be less than the watchdog limit to get the giant packet status. Values: 1'b0: Giant Packet Size Limit Control is disabled 1'b1: Giant Packet Size Limit Control is enabled
22	RW	0x0	S2KP IEEE 802.3as Support for 2K Packets When this bit is set, the MAC considers all packets with up to 2,000 bytes length as normal packets. When the JE bit is not set, the MAC considers all received packets of size more than 2K bytes as Giant packets.When this bit is reset and the JE bit is not set, the MAC considers all received packets of size more than 1,518 bytes (1,522 bytes for tagged) as giant packets. Note: When the JE bit is set, setting this bit has no effect on the giant packet status. Values: 1'b0: Support upto 2K packet is disabled 1'b1: Support upto 2K packet is Enabled

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
21	RW	0x0	CST CRC stripping for Type packets When this bit is set, the last four bytes (FCS) of all packets of Ether type (type field greater than 1,536) are stripped and dropped before forwarding the packet to the application. Note: For information about how the settings of the ACS bit and this bit impact the packet length, see the Table, Packet Length based on the CST and ACS Bits. Values: 1'b0: CRC stripping for Type packets is disabled 1'b1: CRC stripping for Type packets is enabled
20	RW	0x0	ACS Automatic Pad or CRC Stripping When this bit is set, the MAC strips the Pad or FCS field on the incoming packets only if the value of the length field is less than 1,536 bytes. All received packets with length field greater than or equal to 1,536 bytes are passed to the application without stripping the Pad or FCS field.When this bit is reset, the MAC passes all incoming packets to the application, without any modification. Note: For information about how the settings of CST bit and this bit impact the packet length, see the Table, Packet Length based on the CST and ACS Bit. Values: 1'b0: Automatic Pad or CRC Stripping is disabled 1'b1: Automatic Pad or CRC Stripping is enabled
19	RW	0x0	WD Watchdog Disable When this bit is set, the MAC disables the watchdog timer on the receiver. The MAC can receive packets of up to 16,383 bytes.When this bit is reset, the MAC does not allow more than 2,048 bytes (10,240 if JE is set high) of the packet being received. The MAC cuts off any bytes received after 2,048 bytes. Values: 1'b0: Watchdog is enabled 1'b1: Watchdog is disabled
18	RW	0x0	BE Packet Burst Enable When this bit is set, the MAC allows packet bursting during transmission in the GMII half-duplex mode. Values: 1'b0: Packet Burst is disabled 1'b1: Packet Burst is enabled
17	RW	0x0	JD Jabber Disable When this bit is set, the MAC disables the jabber timer on the transmitter. The MAC can transfer packets of up to 16,383 bytes. When this bit is reset, if the application sends more than 2,048 bytes of data (10,240 if JE is set high) during transmission, the MAC does not send rest of the bytes in that packet. Values: 1'b0: Jabber is enabled 1'b1: Jabber is disabled

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
16	RW	0x0	JE Jumbo Packet Enable When this bit is set, the MAC allows jumbo packets of 9,018 bytes (9,022 bytes for VLAN tagged packets) without reporting a giant packet error in the Rx packet status. Values: 1'b0: Jumbo packet is disabled 1'b1: Jumbo packet is enabled
15	RW	0x0	PS Port Select This bit selects the Ethernet line speed. This bit, along with Bit 14, selects the exact line speed. In the 10/100 Mbps-only (always 1) or 1000 Mbps-only (always 0) configurations, this bit is read-only (RO) with appropriate value. In default 10/100/1000 Mbps configurations, this bit is read-write (R/W). The mac_speed_o[1] signal reflects the value of this bit. Values: 1'b0: For 1000 or 2500 Mbps operations 1'b1: For 10 or 100 Mbps operations
14	RW	0x0	FES Speed This bit selects the speed mode. The mac_speed_o[0] signal reflects the value of this bit. Values: 1'b0: 10 Mbps when PS bit is 1 and 1 Gbps when PS bit is 0 1'b1: 100 Mbps when PS bit is 1 and 2.5 Gbps when PS bit is 0
13	RW	0x0	DM Duplex Mode When this bit is set, the MAC operates in the full-duplex mode in which it can transmit and receive simultaneously. This bit is RO with default value of 1'b1 in the full-duplex-only configurations. Values: 1'b0: Half-duplex mode 1'b1: Full-duplex mode
12	RW	0x0	LM Loopback Mode When this bit is set, the MAC operates in the loopback mode at GMII or MII. The (G)MII Rx clock input (clk_rx_i) is required for the loopback to work properly. This is because the Tx clock is not internally looped back. Values: 1'b0: Loopback is disabled 1'b1: Loopback is enabled
11	RW	0x0	ECRSFD Enable Carrier Sense Before Transmission in Full-Duplex Mode When this bit is set, the MAC transmitter checks the CRS signal before packet transmission in the full-duplex mode. The MAC starts the transmission only when the CRS signal is low.When this bit is reset, the MAC transmitter ignores the status of the CRS signal. Values: 1'b0: ECRSFD is disabled 1'b1: ECRSFD is enabled

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
10	RW	0x0	DO Disable Receive Own When this bit is set, the MAC disables the reception of packets when the gmii_txen_o is asserted in the half-duplex mode. When this bit is reset, the MAC receives all packets given by the PHY.This bit is not applicable in the full-duplex mode. Values: 1'b0: Enable Receive Own 1'b1: Disable Receive Own
9	RW	0x0	DCRS Disable Carrier Sense During Transmission When this bit is set, the MAC transmitter ignores the (G)MII CRS signal during packet transmission in the half-duplex mode. As a result, no errors are generated because of Loss of Carrier or No Carrier during transmission. When this bit is reset, the MAC transmitter generates errors because of Carrier Sense. The MAC can even abort the transmission. Values: 1'b0: Enable Carrier Sense During Transmission 1'b1: Disable Carrier Sense During Transmission
8	RW	0x0	DR Disable Retry When this bit is set, the MAC attempts only one transmission. When a collision occurs on the GMII or MII interface, the MAC ignores the current packet transmission and reports a Packet Abort with excessive collision error in the Tx packet status.When this bit is reset, the MAC retries based on the settings of the BL field. This bit is applicable only in the half-duplex mode. Values: 1'b0: Enable Retry 1'b1: Disable Retry
7	RO	0x0	reserved
6:5	RW	0x0	BL Back-Off Limit The back-off limit determines the random integer number (r) of slot time delays (4,096 bit times for 1000/2500 Mbps; 512 bit times for 10/100 Mbps) for which the MAC waits before rescheduling a transmission attempt during retries after a collision. n = retransmission attempt. The random integer r takes the value in the range 0 <= r < 2^k This bit is applicable only in the half-duplex mode. Values: 2'b00: k = min(n,10) 2'b01: k = min(n,8) 2'b10: k = min(n,4) 2'b11: k = min(n,1)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
4	RW	0x0	DC Deferral Check When this bit is set, the deferral check function is enabled in the MAC. The MAC issues a Packet Abort status, along with the excessive deferral error bit set in the Tx packet status, when the Tx state machine is deferred for more than 24,288 bit times in 10 or 100 Mbps mode. If the MAC is configured for 1000/2500 Mbps operation, the threshold for deferral is 155,680 bits times. Deferral begins when the transmitter is ready to transmit, but it is prevented because of an active carrier sense signal (CRS) on GMII or MII. The defer time is not cumulative. For example, if the transmitter defers for 10,000 bit times because the CRS signal is active and the CRS signal becomes inactive, the transmitter transmits and collision happens. Because of collision, the transmitter needs to back off and then defer again after back off completion. In such a scenario, the deferral timer is reset to 0, and it is restarted. When this bit is reset, the deferral check function is disabled and the MAC defers until the CRS signal goes inactive. This bit is applicable only in the half-duplex mode. Values: 1'b0: Deferral check function is disabled 1'b1: Deferral check function is enabled
3:2	RW	0x0	PRELEN Preamble Length for Transmit packets These bits control the number of preamble bytes that are added to the beginning of every Tx packet. The preamble reduction occurs only when the MAC is operating in the full-duplex mode. Values: 2'b00: 7 bytes of preamble 2'b01: 5 bytes of preamble 2'b10: 3 bytes of preamble 2'b11: Reserved
1	RW	0x0	TE Transmitter Enable When this bit is set, the Tx state machine of the MAC is enabled for transmission on the GMII or MII interface. When this bit is reset, the MAC Tx state machine is disabled after it completes the transmission of the current packet. The Tx state machine does not transmit any more packets. Values: 1'b0: Transmitter is disabled 1'b1: Transmitter is enabled
0	RW	0x0	RE Receiver Enable When this bit is set, the Rx state machine of the MAC is enabled for receiving packets from the GMII or MII interface. When this bit is reset, the MAC Rx state machine is disabled after it completes the reception of the current packet. The Rx state machine does not receive any more packets from the GMII or MII interface. Values: 1'b0: Receiver is disabled 1'b1: Receiver is enabled

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:25	RW	0x00	EIPG Extended Inter-Packet Gap The value in this field is applicable when the EIPGEN bit is set. This field (as Most Significant bits), along with IPG field in MAC_Configuration register, gives the minimum IPG greater than 96 bit times in steps of 8 bit times: {EIPG, IPG} 8'h00 - 104 bit times 8'h01 - 112 bit times 8'h02 - 120 bit times ---------- 8'hFF - 2144 bit times
24	RW	0x0	EIPGEN Extended Inter-Packet Gap Enable When this bit is set, the MAC interprets EIPG field and IPG field in MAC_Configuration register together as minimum IPG greater than 96 bit times in steps of 8 bit times. When this bit is reset, the MAC ignores EIPG field and interprets IPG field in MAC_Configuration register as minimum IPG less than or equal to 96 bit times in steps of 8 bit times. Note: The extended Inter-Packet Gap feature must be enabled when operating in Full-Duplex mode only. There may be undesirable effects on back-pressure function and frame transmission if it is enabled in Half-Duplex mode. Values: 1'b0: Extended Inter-Packet Gap is disabled 1'b1: Extended Inter-Packet Gap is enabled
23	RO	0x0	reserved
22:20	RW	0x0	HDSMS Maximum Size for Splitting the Header Data These bits indicate the maximum header size allowed for splitting the header data in the received packet. Values: 0x0 (64BYTES): Maximum Size for Splitting the Header Data is 64 bytes 0x1 (128BYTES): Maximum Size for Splitting the Header Data is 128 bytes 0x2 (256BYTES): Maximum Size for Splitting the Header Data is 256 bytes 0x3 (512BYTES): Maximum Size for Splitting the Header Data is 512 bytes 0x4 (1024BYTES): Maximum Size for Splitting the Header Data is 1024 bytes 0x5 (RSVD): Reserved

18	RW	0x0	USP Unicast Slow Protocol Packet Detect When this bit is set, the MAC detects the Slow Protocol packets with unicast address of the station specified in the MAC_Address0_High and MAC_Address0_Low registers. The MAC also detects the Slow Protocol packets with the Slow Protocols multicast address (01-80-C2-00-00-02). When this bit is reset, the MAC detects only Slow Protocol packets with the Slow Protocol multicast address specified in the IEEE 802.3-2015, Section 5. Values: 1'b0: Unicast Slow Protocol Packet Detection is disabled 1'b1: Unicast Slow Protocol Packet Detection is enabled
17	RW	0x0	SPEN Slow Protocol Detection Enable When this bit is set, MAC processes the Slow Protocol packets (Ether Type 0x8809) and provides the Rx status. The MAC discards the Slow Protocol packets with invalid sub-types. When this bit is reset, the MAC forwards all error-free Slow Protocol packets to the application. The MAC considers such packets as normal Type packets. Values: 1'b0: Slow Protocol Detection is disabled 1'b1: Slow Protocol Detection is enabled
16	RW	0x0	DCRCC Disable CRC Checking for Received Packets When this bit is set, the MAC receiver does not check the CRC field in the received packets. When this bit is reset, the MAC receiver always checks the CRC field in the received packets. Values: 1'b0: CRC Checking is enabled 1'b1: CRC Checking is disabled
15:14	RO	0x0	reserved
13:0	RW	0x0000	GPSL Giant Packet Size Limit If the received packet size is greater than the value programmed in this field in units of bytes, the MAC declares the received packet as Giant packet. The value programmed in this field must be greater than or equal to 1,518 bytes. Any other programmed value is considered as 1,518 bytes. For VLAN tagged packets, the MAC adds 4 bytes to the programmed value. When the Enable Double VLAN Processing option is selected, the MAC adds 8 bytes to the programmed value for double VLAN tagged packets. The value in this field is applicable when the GPSLCE bit is set in MAC_Configuration register.

GMAC_MAC_PACKET_FILTER

Address: **Operational Base** + offset (0x0008)

Bit	Attr	Reset Value	Description
31	RW	0x0	RA Receive All When this bit is set, the MAC Receiver module passes all received packets to the application, irrespective of whether they pass the address filter or not. The result of the SA or DA filtering is updated (pass or fail) in the corresponding bit in the Rx Status Word. When this bit is reset, the Receiver module passes only those packets to the application that pass the SA or DA address filter. 0x0 (DISABLE): Receive All is disabled 0x1 (ENABLE): Receive All is enabled
30:22	RO	0x000	reserved
21	RW	0x0	DNTU Drop Non-TCP/UDP over IP Packets When this bit is set, the MAC drops the non-TCP or UDP over IP packets. The MAC forward only those packets that are processed by the Layer 4 filter. When this bit is reset, the MAC forwards all non-TCP or UDP over IP packets. 0x0 (FWD): Forward Non-TCP/UDP over IP Packets 0x1 (DROP): Drop Non-TCP/UDP over IP Packets
20	RW	0x0	IPFE Layer 3 and Layer 4 Filter Enable When this bit is set, the MAC drops packets that do not match the enabled Layer 3 and Layer 4 filters. If Layer 3 or Layer 4 filters are not enabled for matching, this bit does not have any effect. When this bit is reset, the MAC forwards all packets irrespective of the match status of the Layer 3 and Layer 4 fields. 0x0 (DISABLE): Layer 3 and Layer 4 Filters are disabled 0x1 (ENABLE): Layer 3 and Layer 4 Filters are enabled
19:17	RO	0x0	reserved
16	RW	0x0	VTFE VLAN Tag Filter Enable When this bit is set, the MAC drops the VLAN tagged packets that do not match the VLAN Tag. When this bit is reset, the MAC forwards all packets irrespective of the match status of the VLAN Tag. Values: 1'b0: VLAN Tag Filter is disabled 1'b1: VLAN Tag Filter is enabled
15:11	RO	0x00	reserved
10	RW	0x0	HPF Hash or Perfect Filter When this bit is set, the address filter passes a packet if it matches either the perfect filtering or hash filtering as set by the HMC or HUC bit. When this bit is reset and the HUC or HMC bit is set, the packet is passed only if it matches the Hash filter. Values: 1'b0: Hash or Perfect Filter is disabled 2'b1: Hash or Perfect Filter is enabled

Bit	Attr	Reset Value	Description
9	RW	0x0	SAF Source Address Filter Enable When this bit is set, the MAC compares the SA field of the received packets with the values programmed in the enabled SA registers. If the comparison fails, the MAC drops the packet. When this bit is reset, the MAC forwards the received packet to the application with updated SAF bit of the Rx Status depending on the SA address comparison. Note: According to the IEEE specification, Bit 47 of the SA is reserved. However, in DWC_ether_qos, the MAC compares all 48 bits. The software driver should take this into consideration while programming the MAC address registers for SA. 0x0 (DISABLE): SA Filtering is disabled 0x1 (ENABLE): SA Filtering is enabled
8	RW	0x0	SAIF SA Inverse Filtering When this bit is set, the Address Check block operates in the inverse filtering mode for SA address comparison. If the SA of a packet matches the values programmed in the SA registers, it is marked as failing the SA Address filter. When this bit is reset, if the SA of a packet does not match the values programmed in the SA registers, it is marked as failing the SA Address filter. 0x0 (DISABLE): SA Inverse Filtering is disabled 0x1 (ENABLE): SA Inverse Filtering is enabled
7:6	RW	0x0	PCF Pass Control Packets These bits control the forwarding of all control packets (including unicast and multicast Pause packets). Values: 2'b00: MAC filters all control packets from reaching the application 2'b01: MAC forwards all control packets except Pause packets to the application even if they fail the Address filter 2'b10: MAC forwards all control packets to the application even if they fail the Address filter 2'b11: MAC forwards the control packets that pass the Address filter
5	RW	0x0	DBF Disable Broadcast Packets When this bit is set, the AFM module blocks all incoming broadcast packets. In addition, it overrides all other filter settings. When this bit is reset, the AFM module passes all received broadcast packets. Values: 1'b0: Enable Broadcast Packets 1'b1: Disable Broadcast Packets
4	RW	0x0	PM Pass All Multicast When this bit is set, it indicates that all received packets with a multicast destination address (first bit in the destination address field is '1') are passed. When this bit is reset, filtering of multicast packet depends on HMC bit. Values: 1'b0: Pass All Multicast is disabled 1'b1: Pass All Multicast is enabled

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
3	RW	0x0	DAIF DA Inverse Filtering When this bit is set, the Address Check block operates in inverse filtering mode for the DA address comparison for both unicast and multicast packets. When this bit is reset, normal filtering of packets is performed. Values: 1'b0: DA Inverse Filtering is disabled 1'b1: DA Inverse Filtering is enabled
2	RW	0x0	HMC Hash Multicast When this bit is set, the MAC performs the destination address filtering of received multicast packets according to the hash table. When this bit is reset, the MAC performs the perfect destination address filtering for multicast packets, that is, it compares the DA field with the values programmed in DA registers. Values: 1'b0: Hash Multicast is disabled 1'b1: Hash Multicast is enabled
1	RW	0x0	HUC Hash Unicast When this bit is set, the MAC performs the destination address filtering of unicast packets according to the hash table. When this bit is reset, the MAC performs a perfect destination address filtering for unicast packets, that is, it compares the DA field with the values programmed in DA registers. Values: 1'b0: Hash Unicast is disabled 1'b1: Hash Unicast is enabled
0	RW	0x0	PR Promiscuous Mode When this bit is set, the Address Filtering module passes all incoming packets irrespective of the destination or source address. The SA or DA Filter Fails status bits of the Rx Status Word are always cleared when PR is set. Values: 1'b0: Promiscuous Mode is disabled 1'b1: Promiscuous Mode is enabled

GMAC_MAC_WATCHDOG_TIMEOUT

Address: **Operational Base** + offset (0x000C)

31:9	RO	0x000000	reserved
8	RW	0x0	PWE Programmable Watchdog Enable Programmable Watchdog Enable When this bit is set and the WD bit of the MAC_Configuration register is reset, the WTO field is used as watchdog timeout for a received packet. When this bit is cleared, the watchdog timeout for a received packet is controlled by setting of WD and JE bits in MAC_Configuration register. Values: 1'b0: Programmable Watchdog is disabled 1'b1: Programmable Watchdog is enabled
7:4	RO	0x0	reserved

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
3:0	RW	0x0	WTO Watchdog Timeout When the PWE bit is set and the WD bit of the MAC_Configuration register is reset, this field is used as watchdog timeout for a received packet. If the length of a received packet exceeds the value of this field, such packet is terminated and declared as an error packet. Note: When the PWE bit is set, the value in this field should be more than 1,522 (0x05F2). Otherwise, the IEEE 802.3-specified valid tagged packets are declared as error packets and then dropped. Values: 4'b0000: 2 KB 4'b0001: 3 KB 4'b0010: 4 KB 4'b0011: 5 KB 4'b0100: 6 KB 4'b0101: 7 KB 4'b0110: 8 KB 4'b0111: 9 KB 4'b1000: 10 KB 4'b1001: 11 KB 4'b1010: 12 KB 4'b1011: 13 KB 4'b1100: 14 KB 4'b1101: 15 KB 4'b1110: 16383 Bytes 4'b1111: Reserved

GMAC_MAC_HASH_TABLE_REG0

Address: **Operational Base** + offset (0x0010)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	HT31T0 MAC Hash Table First 32 Bits This field contains the first 32 Bits [31:0] of the Hash table. The Hash table is used for group address filtering. For hash filtering, the content of the destination address in the incoming packet is passed through the CRC logic and the upper six (seven in 128-bit Hash or eight in 256-bit Hash) bits of the CRC register are used to index the content of the Hash table. The most significant bits determines the register to be used (Hash Table Register X), and the least significant five bits determine the bit within the register. For example, a hash value of 6'b100000 (in 64-bit Hash) selects Bit 0 of the Hash Table Register 1, a value of 7b'1110000 (in 128-bit Hash) selects Bit 16 of the Hash Table Register 3 and a value of 8b'10111111 (in 256-bit Hash) selects Bit 31 of the Hash Table Register 5. The hash value of the destination address is calculated in the following way: 1. Calculate the 32-bit CRC for the DA (See IEEE 802.3, Section 3.2.8 for the steps to calculate CRC32). 2. Perform bitwise reversal for the value obtained in Step 1. 3. Take the upper 6 (or 7 or 8) bits from the value obtained in Step 2. If the corresponding bit value of the register is 1'b1, the packet is accepted. Otherwise, it is rejected. If the PM bit is set in MAC_Packet_Filter, all multicast packets are accepted regardless of the multicast hash values. If the Hash Table register is configured to be double-synchronized to the (G)MII clock domain, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the Hash Table Register X registers are written.If double-synchronization is enabled, consecutive writes to this register should be performed after at least four clock cycles in the destination clock domain.

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	HT95T64 MAC Hash Table Third 32 Bits This field contains the third 32 Bits [95:64] of the Hash table.

GMAC_MAC_VLAN_TAG_CTRL

Address: **Operational Base** + offset (0x0050)

Bit	Attr	Reset Value	Description
31	RW	0x0	EIVLRXS Enable Inner VLAN Tag in Rx Status When this bit is set, the MAC provides the inner VLAN Tag in the Rx status. When this bit is reset, the MAC does not provide the inner VLAN Tag in Rx status. 0x0 (DISABLE): Inner VLAN Tag in Rx status is disabled

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
			0x1 (ENABLE): Inner VLAN Tag in Rx status is enabled
30	RO	0x0	reserved
29:28	RW	0x0	EIVLS Enable Inner VLAN Tag Stripping on Receive This field indicates the stripping operation on inner VLAN Tag in received packet. 0x0 (DONOT): Do not strip 0x1 (IFPASS): Strip if VLAN filter passes 0x2 (IFFAIL): Strip if VLAN filter fails 0x3 (ALWAYS): Always strip
27	RW	0x0	ERIVLT Enable Inner VLAN Tag 0x0 (DISABLE): Inner VLAN tag is disabled 0x1 (ENABLE): Inner VLAN tag is enabled
26	RW	0x0	EDVLP Enable Double VLAN Processing When this bit is set, the MAC enables processing of up to two VLAN Tags on Tx and Rx (if present). When this bit is reset, the MAC enables processing of up to one VLAN Tag on Tx and Rx (if present). 0x0 (DISABLE): Double VLAN Processing is disabled 0x1 (ENABLE): Double VLAN Processing is enabled
25	RW	0x0	VTHM VLAN Tag Hash Table Match Enable When this bit is set, the most significant four bits of CRC of VLAN Tag (ones-complement of most significant four bits of CRC of VLAN Tag when ETV bit is reset) are used to index the content of the MAC_VLAN_Hash_Table register. A value of 1 in the VLAN Hash Table register, corresponding to the index, indicates that the packet matched the VLAN hash table. When the ETV bit is set, the CRC of the 12-bit VLAN Identifier (VID) is used for comparison. When the ETV bit is reset, the ones-complement of the CRC of the 16-bit VLAN tag is used for comparison. When this bit is reset, the VLAN Hash Match operation is not performed. 0x0 (DISABLE): VLAN Tag Hash Table Match is disabled 0x1 (ENABLE): VLAN Tag Hash Table Match is enabled
24	RW	0x0	EVLRXS Enable VLAN Tag in Rx status When this bit is set, MAC provides the outer VLAN Tag in the Rx status. When this bit is reset, the MAC does not provide the outer VLAN Tag in Rx status. Values: 1'b0: VLAN Tag in Rx status is disabled 1'b1: VLAN Tag in Rx status is enabled
23	RO	0x0	reserved
22:21	RW	0x0	EVLS Enable VLAN Tag Stripping on Receive This field indicates the stripping operation on the outer VLAN Tag in received packet. Values: 2'b00: Do not strip 2'b01: Strip if VLAN filter passes 2'b10: Strip if VLAN filter fails 2'b11: Always strip

25	RW	0x0	DMACHN DMA Channel Number The DMA Channel number to which the VLAN Tagged Frame is to be routed if it passes this VLAN Tag Filter is programmed in this field. If the Routing based on VLAN Tag Filter is not necessary, this field need not be programmed.
24	RW	0x0	DMACHEN DMA Channel Number Enable This bit is the Enable for the DMA Channel Number value programmed in the field DMACH. When this bit is reset, the Routing does not occur based on VLAN Filter result. The frame is routed based on DA Based DMA Channel Routing. 0x0 (DISABLE): DMA Channel Number is disabled 0x1 (ENABLE): DMA Channel Number is enabled
23:21	RO	0x0	reserved
20	RW	0x0	ERIVLT Enable Inner VLAN Tag Comparison This bit is valid only when VLAN Tag Enable of the Filter is set. When this bit and the EDVLP field are set, the MAC receiver enables operation on the inner VLAN Tag (if present). When this bit is reset, the MAC receiver enables operation on the outer VLAN Tag (if present). 0x0 (DISABLE): Inner VLAN tag comparison is disabled 0x1 (ENABLE): Inner VLAN tag comparison is enabled
19	RW	0x0	ERSVLM Enable S-VLAN Match for received Frames This bit is valid only when VLAN Tag Enable of the Filter is set. When this bit is set, the MAC receiver enables filtering or matching for S-VLAN (Type = 0x88A8) packets. When this bit is reset, the MAC receiver enables filtering or matching for C-VLAN (Type = 0x8100) packets. 0x0 (DISABLE): Receive S-VLAN Match is disabled 0x1 (ENABLE): Receive S-VLAN Match is enabled
18	RW	0x0	DOVLTC Disable VLAN Type Comparison This bit is valid only when VLAN Tag Enable of the Filter is set.When this bit is set, the MAC does not check whether the VLAN Tag specified by the Enable Inner VLAN Tag Comparison bit is of type S-VLAN or C-VLAN. When this bit is reset, the MAC filters or matches the VLAN Tag specified by the Enable Inner VLAN Tag Comparison bit only when VLAN Tag type is similar to the one specified by the Enable S-VLAN Match for received Frames bit. 0x0 (ENABLE): VLAN type comparison is enabled 0x1 (DISABLE): VLAN type comparison is disabled
17	RW	0x0	ETV 12bits or 16bits VLAN comparison This bit is valid only when VEN of the Filter is set.When this bit is set, a 12-bit VLAN identifier is used for comparing and filtering instead of the complete 16-bit VLAN tag. Bits [11:0] of VLAN tag are compared with the corresponding field in the received VLAN-tagged packet. 0x0 (16BIT): 16 bit VLAN comparison 0x1 (12BIT): 12 bit VLAN comparison

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
16	RW	0x0	VEN VLAN Tag Enable This bit is used to enable or disable the VLAN Tag.When this bit is set, the MAC compares the VLAN Tag of received packet with the VLAN Tag ID. When this bit is reset, no comparison is performed irrespective of the programming of the other fields. 0x0 (DISABLE): VLAN Tag is disabled 0x1 (ENABLE): VLAN Tag is enabled
15:0	RW	0x0000	VID VLAN Tag ID This field holds the VLAN Tag value which is used by the MAC for perfect comparison. It is valid when VLAN Tag Enable is set.

GMAC_MAC_VLAN_HASH_TABLE

Address: **Operational Base** + offset (0x0058)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	VLHT VLAN Hash Table This field contains the 16-bit VLAN Hash Table. For hash filtering, the content of the 16-bit VLAN tag or 12-bit VLAN ID (based on the ETV bit of MAC_VLAN_Tag Register) in the incoming packet is passed through the CRC logic. When ETV bit of MAC_VLAN_Tag register is set, the upper four bits of the calculated CRC are used to index the contents of the VLAN Hash table. When ETV bit of MAC_VLAN_Tag register is reset, the ones-complement of upper four bits of the calculated CRC are used to index the contents of the VLAN Hash table. For example, when ETV bit is set a hash value of 4b'1000 selects Bit 8 of the VLAN Hash table, whereas when ETV bit is reset a hash value of 4b'1000 selects Bit 7 of the VLAN Hash table. The hash value of the destination address is calculated in the following way: 1.Calculate the 32-bit CRC for the VLAN tag or ID (For steps to calculate CRC32, see Section 3.2.8 of IEEE 802.3). 2.Perform bitwise reversal for the value obtained in step 1. 3.Take the upper four bits from the value obtained in step 2. If the VLAN hash Table register is configured to be double-synchronized to the (G)MII clock domain, the synchronization is triggered only when Bits[15:8] (in little-endian mode) or Bits[7:0] (in big-endian mode) of this register are written. 1.If double-synchronization is enabled, consecutive writes to this register should be performed after at least four clock cycles in the destination clock domain.

GMAC_MAC_VLAN_INCL

Address: **Operational Base** + offset (0x0060)

Bit	Attr	Reset Value	Description
31	RO	0x0	BUSY Busy This bit indicates the status of the read/write operation of indirect access to the queue/channel specific VLAN inclusion register. For write operation write to a register is complete when this bit is reset. For read operation the read data is valid when the bit is reset.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
			The application must make sure that this bit is reset before attempting subsequent access to this register. Values: 0x0 (INACTIVE): Busy status not detected 0x1 (ACTIVE): Busy status detected
30	RW	0x0	RDWR Read write control This bit controls the read or write operation for indirectly accessing the queue/channel specific VLAN Inclusion register. When set indicates write operation and when reset indicates read operation. This does not have any effect when CBTI is reset. Values: 0x0 (READ): Read operation of indirect access 0x1 (WRITE): Write operation of indirect access
29:25	RO	0x00	reserved
24	RW	0x0	ADDR Address This field selects one of the queue/channel specific VLAN Inclusion register for read/write access. This does not have any effect when CBTI is reset.
23:22	RO	0x0	reserved
21	RW	0x0	CBTI Channel based tag insertion When this bit is set, outer VLAN tag is inserted for every packets transmitted by the MAC. The tag value is taken from the queue/channel specific VLAN tag register. The VLTI, VLP, VLC, and VLT fields of this register are ignored when this bit is set. When this bit is set, a write operation to byte 3 of this register initiates the read/write access to the indirect register. When reset, outer VLAN operation is based on the setting of VLTI, VLP, VLC and VLT fields of this register.
20	RW	0x0	VLTI VLAN Tag Input When this bit is set, it indicates that the VLAN tag to be inserted or replaced in Tx packet should be taken from the following: 1.The mti_vlan_tag_i signal in EQOS-CORE configurations 2.The control word in EQOS-MTL configurations 3.The Tx descriptor in EQOS-AHB, EQOS-AXI, or EQOS-DMA configurations Values: 0x0 (DISABLE): VLAN Tag Input is disabled 0x1 (ENABLE): VLAN Tag Input is enabled
19	RW	0x0	CSVL C-VLAN or S-VLAN When this bit is set, S-VLAN type (0x88A8) is inserted or replaced in the 13th and 14th bytes of transmitted packets. When this bit is reset, C-VLAN type (0x8100) is inserted or replaced in the 13th and 14th bytes of transmitted packets. Values: 0x0 (C-VLAN): C-VLAN type (0x8100) is inserted or replaced 0x1 (S-VLAN): S-VLAN type (0x88A8) is inserted or replaced

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
18	RW	0x0	VLP VLAN Priority Control When this bit is set, the control bits[17:16] are used for VLAN deletion, insertion, or replacement. When this bit is reset, the mti_vlan_ctrl_i control input is used and bits[17:16] are ignored. Values: 0x0 (DISABLE): VLAN Priority Control is disabled 0x1 (ENABLE): VLAN Priority Control is enabled
17:16	RW	0x0	VLC VLAN Tag Control in Transmit Packets 2'b00: No VLAN tag deletion, insertion, or replacement 2'b01: VLAN tag deletion The MAC removes the VLAN type (bytes 13 and 14) and VLAN tag (bytes 15 and 16) of all transmitted packets with VLAN tags. 2'b10: VLAN tag insertion The MAC inserts VLT in bytes 15 and 16 of the packet after inserting the Type value (0x8100 or 0x88a8) in bytes 13 and 14. This operation is performed on all transmitted packets, irrespective of whether they already have a VLAN tag. 2'b11: VLAN tag replacement The MAC replaces VLT in bytes 15 and 16 of all VLAN-type transmitted packets (Bytes 13 and 14 are 0x8100 or 0x88a8). Note: Changes to this field take effect only on the start of a packet. If you write this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value. Values: 0x0 (NONE): No VLAN tag deletion, insertion, or replacement 0x1 (DELETE): VLAN tag deletion 0x2 (INSERT): VLAN tag insertion 0x3 (REPLACE): VLAN tag replacement
15:0	RW	0x0000	VLT VLAN Tag for Transmit Packets This field contains the value of the VLAN tag to be inserted or replaced. The value must only be changed when the transmit lines are inactive or during the initialization phase.Bits[15:13] are the User Priority field, Bit 12 is the CFI/DEI field, and Bits[11:0] are the VID field in the VLAN tag. The following list describes the bits of this field: 1.Bits[15:13]: User Priority 2.Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI) 3.Bits[11:0]: VLAN Identifier (VID) field of VLAN tag

Values: 0x0 (C-VLAN): C-VLAN type (0x8100) is inserted 0x1 (S-VLAN): S-VLAN type (0x88A8) is inserted
18	RW	0x0	VLP VLAN Priority Control When this bit is set, the VLC field is used for VLAN deletion, insertion, or replacement. When this bit is reset, the mti_vlan_ctrl_i control input is used and the VLC field is ignored. Values: 0x0 (DISABLE): VLAN Priority Control is disabled 0x1 (ENABLE): VLAN Priority Control is enabled
17:16	RW	0x0	VLC VLAN Tag Control in Transmit Packets 2'b00: No VLAN tag deletion, insertion, or replacement 2'b01: VLAN tag deletion The MAC removes the VLAN type (bytes 17 and 18) and VLAN tag (bytes 19 and 20) of all transmitted packets with VLAN tags. 2'b10: VLAN tag insertion The MAC inserts VLT in bytes 19 and 20 of the packet after inserting the Type value (0x8100 or 0x88a8) in bytes 17 and 18. This operation is performed on all transmitted packets, irrespective of whether they already have a VLAN tag. 2'b11: VLAN tag replacement The MAC replaces VLT in bytes 19 and 20 of all VLAN-type transmitted packets (Bytes 17 and 18 are 0x8100 or 0x88a8). Note: Changes to this field take effect only on the start of a packet. If you write this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value. Values: 0x0 (NONE): No VLAN tag deletion, insertion, or replacement 0x1 (DELETE): VLAN tag deletion 0x2 (INSERT): VLAN tag insertion 0x3 (REPLACE): VLAN tag replacement

Bit	Attr	Reset Value	Description
15:0	RW	0x0000	VLT VLAN Tag for Transmit Packets This field contains the value of the VLAN tag to be inserted or replaced. The value must only be changed when the transmit lines are inactive or during the initialization phase. Bits[15:13] are the User Priority field, Bit 12 is the CFI/DEI field, and Bits[11:0] are the VID field in the VLAN tag. The following list describes the bits of this field: 1.Bits[15:13]: User Priority 2.Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI) 3.Bits[11:0]: VLAN Identifier (VID) field of VLAN tag

GMAC_MAC_Q0_TX_FLOW_CTRL

Address: **Operational Base** + offset (0x0070)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	PT Pause Time This field holds the value to be used in the Pause Time field in the Tx control packet. If the Pause Time bits are configured to be double-synchronized to the (G)MII clock domain, consecutive writes to this register should be performed only after at least four clock cycles in the destination clock domain.
15:8	RO	0x00	reserved
7	RW	0x0	DZPQ Disable Zero-Quanta Pause When this bit is set, it disables the automatic generation of the zero-quanta Pause packets on de-assertion of the flow-control signal from the FIFO layer (MTL or external sideband flow control signal sbd_flowctrl_i or mti_flowctrl_i). When this bit is reset, normal operation with automatic zero-quanta Pause packet generation is enabled. Values: 1'b0: Zero-Quanta Pause packet generation is enabled 1'b1: Zero-Quanta Pause packet generation is disabled
6:4	RW	0x0	PLT Pause Low Threshold This field configures the threshold of the Pause timer at which the input flow control signal mti_flowctrl_i (or sbd_flowctrl_i) is checked for automatic retransmission of the Pause packet. The threshold values should be always less than the Pause Time configured in Bits[31:16]. For example, if PT = 100H (256 slot times), and PLT = 001, a second Pause packet is automatically transmitted if the mti_flowctrl_i signal is asserted at 228 (256-28) slot times after the first Pause packet is transmitted. The following list provides the threshold values for different values. The slot time is defined as the time taken to transmit 512 bits (64 bytes) on the GMII or MII interface. This (approximate) computation is based on the packet size (64, 1518, 2000, 9018, 16384, or 32768) + 2 Pause Packet Size + IPG in Slot Times. Values: 3'b000: Pause Time minus 4 Slot Times (PT -4 slot times) 3'b001: Pause Time minus 28 Slot Times (PT -28 slot times) 3'b010: Pause Time minus 36 Slot Times (PT -36 slot times) 3'b011: Pause Time minus 144 Slot Times (PT -144 slot times)

Bit	Attr	Reset Value	Description
			3'b100: Pause Time minus 256 Slot Times (PT -256 slot times) 3'b101: Pause Time minus 512 Slot Times (PT -512 slot times) 3'b110: Reserved
3:2	RO	0x0	reserved
1	RW	0x0	TFE Transmit Flow Control Enable Full-Duplex Mode: In the full-duplex mode, when this bit is set, the MAC enables the flow control operation to Tx Pause packets. When this bit is reset, the flow control operation in the MAC is disabled, and the MAC does not transmit any Pause packets. Half-Duplex Mode: In the half-duplex mode, when this bit is set, the MAC enables the backpressure operation. When this bit is reset, the backpressure feature is disabled. Values: 1'b0: Transmit Flow Control is disabled 1'b1: Transmit Flow Control is enabled
0	RW	0x0	FCB_BPA Flow Control Busy or Backpressure Activate This bit initiates a Pause packet in the full-duplex mode and activates the backpressure function in the half-duplex mode if the TFE bit is set. Full-Duplex Mode: In the full-duplex mode, this bit should be read as 1'b0 before writing to this register. To initiate a Pause packet, the application must set this bit to 1'b1. During Control packet transfer, this bit continues to be set to indicate that a packet transmission is in progress. When Pause packet transmission is complete, the MAC resets this bit to 1'b0. You should not write to this register until this bit is cleared. Half-Duplex Mode: When this bit is set (and TFE bit is set) in the half-duplex mode, the MAC asserts the backpressure. During backpressure, when the MAC receives a new packet, the transmitter starts sending a JAM pattern resulting in a collision. This control register bit is logically ORed with the mti_flowctrl_i input signal for the backpressure function. When the MAC is configured for the full-duplex mode, the BPA is automatically disabled. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. Values: 1'b0: Flow Control Busy or Backpressure Activate is disabled 1'b1: Flow Control Busy or Backpressure Activate is enabled

Bit	Attr	Reset Value	Description
8	RO	0x0	RWT Receive Watchdog Timeout This bit is set when a packet with length greater than 2,048 bytes is received (10, 240 bytes when Jumbo Packet mode is enabled) and the WD bit is reset in the MAC_Configuration register. This bit is set when a packet with length greater than 16,383 bytes is received and the WD bit is set in the MAC_Configuration register. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: No receive watchdog timeout 1'b1: Receive watchdog timed out
7:6	RO	0x0	reserved
5	RO	0x0	EXCOL Excessive Collisions When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the transmission aborted after 16 successive collisions while attempting to transmit the current packet. If the DR bit is set in the MAC_Configuration register, this bit is set after the first collision and the packet transmission is aborted. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: No collision 1'b1: Excessive collision is sensed
4	RO	0x0	LCOL Late Collision When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the packet transmission aborted because a collision occurred after the collision window (64 bytes including Preamble in MII mode; 512 bytes including Preamble and Carrier Extension in GMII mode). This bit is not valid if the Underflow error occurs. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: No collision 1'b1: Late collision is sensed
3	RO	0x0	EXDEF Excessive Deferral When the DTXSTS bit is set in the MTL_Operation_Mode register and the DC bit is set in the MAC_Configuration register, this bit indicates that the transmission ended because of excessive deferral of over 24,288 bit times (155,680 in 1000/2500 Mbps mode or when Jumbo packet is enabled). Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: No Excessive deferral 1'b1: Excessive deferral

Bit	Attr	Reset Value	Description
28:24	RO	0x00	RWKPTR Remote Wake-up FIFO Pointer This field gives the current value (0 to 7, 15, or 31 when 4, 8, or 16 Remote Wake-up Packet Filters are selected) of the Remote Wake-up Packet Filter register pointer. When the value of this pointer is equal to maximum for the selected number of Remote Wake-up Packet Filters, the contents of the Remote Wake-up Packet Filter Register are transferred to the clk_rx_i domain when a Write occurs to that register.
23:11	RO	0x0000	reserved
10	RW	0x0	RWKPFE Remote Wake-up Packet Forwarding Enable When this bit is set along with RWKPKTEN, the MAC receiver drops all received frames until it receives the expected Wake-up frame. All frames after that event including the received wake-up frame are forwarded to application. This bit is then self-cleared on receiving the wake-up packet. The application can also clear this bit before the expected wake-up frame is received. In such cases, the MAC reverts to the default behavior where packets received are forwarded to the application. This bit must only be set when RWKPKTEN is set high and PWRDWN is set low. The setting of this bit has no effect when PWRDWN is set high. Note: If Magic Packet Enable and Wake-Up Frame Enable are both set along with setting of this bit and Magic Packet is received prior to wake-up frame, this bit is self-cleared on receiving Magic Packet, the received Magic packet is dropped, and all frames after received Magic Packet are forwarded to application. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. Values: 1'b0: Remote Wake-up Packet Forwarding is disabled 1'b1: Remote Wake-up Packet Forwarding is enabled
9	RW	0x0	GLBLUCAST Global Unicast When this bit set, any unicast packet filtered by the MAC (DAF) address recognition is detected as a remote wake-up packet. Values: 1'b0: Global unicast is disabled 1'b1: Global unicast is enabled
8:7	RO	0x0	reserved
6	RO	0x0	RWKPRCVD Remote Wake-Up Packet Received When this bit is set, it indicates that the power management event is generated because of the reception of a remote wake-up packet. This bit is cleared when this register is read. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: Remote wake-up packet is received 1'b1: Remote wake-up packet is received

Bit	Attr	Reset Value	Description
5	RO	0x0	MGKPRCVD Magic Packet Received When this bit is set, it indicates that the power management event is generated because of the reception of a magic packet. This bit is cleared when this register is read. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: No Magic packet is received 1'b1: Magic packet is received
4:3	RO	0x0	reserved
2	RW	0x0	RWKPKTEN Remote Wake-Up Packet Enable When this bit is set, a power management event is generated when the MAC receives a remote wake-up packet. Values: 1'b0: Remote wake-up packet is disabled 1'b1: Remote wake-up packet is enabled
1	RW	0x0	MGKPKTEN Magic Packet Enable When this bit is set, a power management event is generated when the MAC receives a magic packet. Values: 1'b0: Magic Packet is disabled 1'b1: Magic Packet is enabled
0	RW	0x0	PWRDWN Power Down When this bit is set, the MAC receiver drops all received packets until it receives the expected magic packet or remote wake-up packet. This bit is then self-cleared and the power-down mode is disabled. The software can clear this bit before the expected magic packet or remote wake-up packet is received. The packets received by the MAC after this bit is cleared are forwarded to the application. This bit must only be set when the Magic Packet Enable, Global Unicast, or Remote Wake-Up Packet Enable bit is set high. Note: You can gate-off the CSR clock during the power-down mode. However, when the CSR clock is gated-off, you cannot perform any read or write operations on this register. Therefore, the Software cannot clear this bit. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. Values: 1'b0: Power down is disabled 1'b1: Power down is enabled

GMAC_MAC_RWK_PACKET_FILTER

Address: **Operational Base** + offset (0x00C4)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	WKUPFRMFTR RWK Packet Filter This field contains the various controls of RWK Packet filter. When the Remote Wakeup Filters are to be programmed, the entire set of wkuppktfilter_reg registers must be written. The wkuppktfilter_reg register is programmed by sequentially writing the eight, sixteen or thirty-two register values in

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
			MAC_RWK_Packet_Filter register for wkuppktfilter_reg0, wkuppktfilter_reg1, ..., wkuppktfilter_reg31 respectively. The wkuppktfilter_reg register is read in a similar way. The MAC updates the wkuppktfilter_reg register current pointer value in RWKPTR field of MAC_PMT_Control_Status register. The Remote Wakeup Filters are arranged in blocks of 4 filters each and each such block have eight 32-bit wide registers, viz. wkuppktfilter_reg0-7, wkuppktfilter_reg8-15, wkuppktfilter_reg16-23 and wkuppktfilter_reg24-31. The fields of Remote Wakeup Filter are described as follows: Filter i Command: The 4-bit filter i command controls the filter i operation. 1. Bit 3 specifies the address type, defining the destination address type of the pattern. When the bit is set, the pattern applies to only multicast packets; when the bit is reset, the pattern applies only to unicast packet. 2. Bit 2 (Inverse Mode), when set, reverses the logic of the CRC16 hash function signal, to reject a packet with matching CRC-16 value. Bit 2, along with Bit 1, allows a MAC to reject a subset of remote wake-up packets by creating filter logic such as "Pattern 1 AND NOT Pattern 2". 3. Bit 1 (And_Previous) implements the Boolean logic. When set, the result of the current entry is logically ANDed with the result of the previous filter. This AND logic allows a filter pattern longer than 32 bytes by splitting the mask among two, three, or four filters. This depends on the number of filters that have the And_Previous bit set. The details are provided below: (1) The And_Previous bit setting is applicable within a set of 4 filters. (2) Setting of And_Previous bit of filter that is not enabled has no effect, that is setting And_Previous bit of lowest number filter in the set of 4 filters has no effect. For example, setting of And_Previous bit of Filter 0 has no effect. (3) If And_Previous bit is set for filter to form AND chained filter, the AND chain breaks at the point any filter is not enabled. For example: If Filter 2 And_Previous bit is set (bit 1 in Filter 2 command is set) but Filter 1 is not enabled (bit 0 in Filter 1 command is reset), then only Filter 2 result is considered. If Filter 2 And_Previous bit is set (bit 1 in Filter 2 command is set), Filter 3 And_Previous bit is set (bit 1 in Filter 3 command is set), but Filter 1 is not enabled (bit 0 in Filter 1 command is reset), then only Filter 2 result ANDed with Filter 3 result is considered. If Filter 2 And_Previous bit is set (bit 1 in Filter 2 command is set), Filter 3 And_Previous bit is set (bit 1 in Filter 3 command is set), but Filter 2 is not enabled (bit 0 in Filter 2 command is reset), then since setting of Filter 2 And_Previous bit has no effect only Filter 1 result ORed with Filter 3 result is considered.

GMAC_RWK_FILTER0_BYTE_MASK

Address: **Operational Base** + offset (0x00C4)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Filter0_Byte_Mask Filter0 32-bit Mask Each bit in this mask corresponds to one byte in the detected packet. If the bit is 1', the corresponding byte is taken into the CRC16 calculation.

GMAC_MAC_LPI_CONTROL_STATUS

Address: **Operational Base** + offset (0x00D0)

Bit	Attr	Reset Value	Description
31:22	RO	0x000	reserved
21	RW	0x0	LPITCSE LPI Tx Clock Stop Enable When this bit is set, the MAC asserts sbd_tx_clk_gating_ctrl_o signal high after it enters Tx LPI mode to indicate that the Tx clock to MAC can be stopped. When this bit is reset, the MAC does not assert sbd_tx_clk_gating_ctrl_o signal high after it enters Tx LPI mode. If RGMII Interface is selected, the Tx clock is required for transmitting the LPI pattern. The Tx Clock cannot be gated and so the LPITCSE bit cannot be programmed. Values: 1'b0: LPI Tx Clock Stop is disabled 1'b1: LPI Tx Clock Stop is enabled
20	RW	0x0	LPIATE LPI Timer Enable This bit controls the automatic entry of the MAC Transmitter into and exit out of the LPI state. When LPIATE, LPITXA and LPIEN bits are set, the MAC Transmitter enters LPI state only when the complete MAC TX data path is IDLE for a period indicated by the MAC_LPI_Entry_Timer register. After entering LPI state, if the data path becomes non-IDLE (due to a new packet being accepted for transmission), the Transmitter exits LPI state but does not clear LPIEN bit. This enables the re-entry into LPI state when it is IDLE again. When LPIATE is 0, the LPI Auto timer is disabled and MAC Transmitter enters LPI state based on the settings of LPITXA and LPIEN bit descriptions. Values: 1'b0: LPI Timer is disabled 1'b1: LPI Timer is enabled

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
19	RW	0x0	LPITXA LPI Tx Automate This bit controls the behavior of the MAC when it is entering or coming out of the LPI mode on the Transmit side. This bit is not functional in the EQOS-CORE configurations in which the Tx clock gating is done during the LPI mode. If the LPITXA and LPIEN bits are set to 1, the MAC enters the LPI mode only after all outstanding packets (in the core) and pending packets (in the application interface) have been transmitted. The MAC comes out of the LPI mode when the application sends any packet for transmission or the application issues a Tx FIFO Flush command. In addition, the MAC automatically clears the LPIEN bit when it exits the LPI state. If Tx FIFO Flush is set in the FTQ bit of MTL_TxQ0_Operation_Mode register, when the MAC is in the LPI mode, it exits the LPI mode. When this bit is 0, the LPIEN bit directly controls behavior of the MAC when it is entering or coming out of the LPI mode. Values: 1'b0: LPI Tx Automate is disabled 1'b1: LPI Tx Automate is enabled
18	RW	0x0	PLSEN PHY Link Status Enable This bit enables the link status received on the RGMII, SGMII, or SMII Receive paths to be used for activating the LPI LS TIMER. When this bit is set, the MAC uses the link-status bits of the MAC_PHYIF_Control_Status register and the PLS bit for the LPI LS Timer trigger. When this bit is reset, the MAC ignores the link-status bits of the MAC_PHYIF_Control_Status register and takes only the PLS bit. Values: 1'b0: PHY Link Status is disabled 1'b1: PHY Link Status is enabled
17	RW	0x0	PLS PHY Link Status This bit indicates the link status of the PHY. The MAC Transmitter asserts the LPI pattern only when the link status is up (OKAY) at least for the time indicated by the LPI LS TIMER. When this bit is set, the link is considered to be okay (UP) and when this bit is reset, the link is considered to be down. Values: 1'b0: link is down 1'b1: link is okay (UP)
16	RW	0x0	LPIEN LPI Enable When this bit is set, it instructs the MAC Transmitter to enter the LPI state. When this bit is reset, it instructs the MAC to exit the LPI state and resume normal transmission. This bit is cleared when the LPITXA bit is set and the MAC exits the LPI state because of the arrival of a new packet for transmission. Values: 1'b0: LPI state is disabled 1'b1: LPI state is enabled
15:10	RO	0x00	reserved

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25:16	RW	0x3e8	LST LPI LS Timer This field specifies the minimum time (in milliseconds) for which the link status from the PHY should be up (OKAY) before the LPI pattern can be transmitted to the PHY. The MAC does not transmit the LPI pattern even when the LPIEN bit is set unless the LPI LS Timer reaches the programmed terminal count. The default value of the LPI LS Timer is 1000 (1 sec) as defined in the IEEE standard.
15:0	RW	0x0000	TWT LPI TW Timer This field specifies the minimum time (in microseconds) for which the MAC waits after it stops transmitting the LPI pattern to the PHY and before it resumes the normal transmission. The TLPIEX status bit is set after the expiry of this timer.

GMAC_MAC_LPI_ENTRY_TIMER

Address: **Operational Base** + offset (0x00D8)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19:3	RW	0x00000	LPIET LPI Entry Timer This field specifies the time in microseconds the MAC waits to enter LPI mode, after it has transmitted all the frames. This field is valid and used only when LPITE and LPITXA are set to 1. Bits [2:0] are read-only so that the granularity of this timer is in steps of 8 micro-seconds.
2:0	RO	0x0	reserved

GMAC_MAC_1US_TIC_COUNTER

Address: **Operational Base** + offset (0x00DC)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11:0	RW	0x03f	TIC_1US_CNTR 1US TIC Counter The application must program this counter so that the number of clock cycles of CSR clock is 1us. (Subtract 1 from the value before programming). For example if the CSR clock is 100MHz then this field needs to be programmed to value 100 - 1 = 99 (which is 0x63). This is required to generate the 1US events that are used to update some of the EEE related counters.

GMAC_MAC_MDIO_ADDRESS

Address: **Operational Base** + offset (0x0200)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27	RW	0x0	PSE Preamble Suppression Enable When this bit is set, the SMA suppresses the 32-bit preamble and transmits MDIO frames with only 1 preamble bit. When this bit is 0, the MDIO frame always has 32 bits of preamble as defined in the IEEE specifications. Values: 1'b0: Preamble Suppression disabled 1'b1: Preamble Suppression enabled
26	RW	0x0	BTB Back to Back transactions When this bit is set and the NTC has value greater than 0, then the MAC informs the completion of a read or write command at the end of frame transfer (before the trailing clocks are transmitted). The software can thus initiate the next command which is executed immediately irrespective of the number trailing clocks generated for the previous frame. When this bit is reset, then the read/write command completion (GB is cleared) only after the trailing clocks are generated. In this mode, it is ensured that the NTC is always generated after each frame. This bit must not be set when NTC=0. Values: 1'b0: Back to Back transactions disabled 1'b1: Back to Back transactions enabled
25:21	RW	0x00	PA Physical Layer Address This field indicates which Clause 22 PHY devices (out of 32 devices) the MAC is accessing. For RevMII, this field gives the PHY Address of the RevMII module. This field indicates which Clause 45 capable PHYs (out of 32 PHYs) the MAC is accessing.
20:16	RW	0x00	RDA Register/Device Address These bits select the PHY register in selected Clause 22 PHY device. For RevMII, these bits select the CSR register in the RevMII Registers set. These bits select the Device (MMD) in selected Clause 45 capable PHY.
15	RO	0x0	reserved

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
14:12	RW	0x0	NTC Number of Trailing Clocks This field controls the number of trailing clock cycles generated on gmii_mdc_o (MDC) after the end of transmission of MDIO frame. The valid values can be from 0 to 7. Programming the value to 3'h3 indicates that there are additional three clock cycles on the MDC line after the end of MDIO frame transfer.
11:8	RW	0x0	CR CSR Clock Range The CSR Clock Range selection determines the frequency of the MDC clock according to the CSR clock frequency used in your design: 4'b0000: CSR clock = 60-100 MHz; MDC clock = CSR clock/42 4'b0001: CSR clock = 100-150 MHz; MDC clock = CSR clock/62 4'b0010: CSR clock = 20-35 MHz; MDC clock = CSR clock/16 4'b0011: CSR clock = 35-60 MHz; MDC clock = CSR clock/26 4'b0100: CSR clock = 150-250 MHz; MDC clock = CSR clock/102 4'b0101: CSR clock = 250-300 MHz; MDC clock = CSR clock/124 4'b0110: CSR clock = 300-500 MHz; MDC clock = CSR clock/204 4'b0111: CSR clock = 500-800 MHz; MDC clock = CSR clock/324 The suggested range of CSR clock frequency applicable for each value (when Bit 11 = 0) ensures that the MDC clock is approximately between 1.0 MHz to 2.5 MHz frequency range. When Bit 11 is set, you can achieve a higher frequency of the MDC clock than the frequency limit of 2.5 MHz (specified in the IEEE 802.3) and program a clock divider of lower value. For example, when CSR clock is of 100 MHz frequency and you program these bits as 1010, the resultant MDC clock is of 12.5 MHz which is above the range specified in IEEE 802.3. Program the following values only if the interfacing chips support faster MDC clocks: 4'b1000: CSR clock/4 4'b1001: CSR clock/6 4'b1010: CSR clock/8 4'b1011: CSR clock/10 4'b1100: CSR clock/12 4'b1101: CSR clock/14 4'b1110: CSR clock/16 4'b1111: CSR clock/18 These bits are not used for accessing RevMII. These bits are read-only if the RevMII interface is selected as single PHY interface.
7:5	RO	0x0	reserved
4	RW	0x0	SKAP Skip Address Packet When this bit is set, the SMA does not send the address packets before read, write, or post-read increment address packets. This bit is valid only when C45E is set. Values: 1'b0: Skip Address Packet is disabled 1'b1: Skip Address Packet is enabled

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
3	RW	0x0	GOC_1 GMII Operation Command 1 This bit is higher bit of the operation command to the PHY or RevMII, GOC_1 and GOC_O is encoded as follows: 2'b00: Reserved 2'b01: Write 2'b10: Post Read Increment Address for Clause 45 PHY 2'b11: Read When Clause 22 PHY or RevMII is enabled, only Write and Read commands are valid. Values: 1'b0: GMII Operation Command 1 is disabled 1'b1: GMII Operation Command 1 is enabled
2	RW	0x0	GOC_0 GMII Operation Command 0 This is the lower bit of the operation command to the PHY or RevMII. When in SMA mode (MDIO master) this bit along with GOC_1 determines the operation to be performed to the PHY. When only RevMII is selected in configuration this bit is read-only and tied to 1. Values: 1'b0: GMII Operation Command 0 is disabled 1'b1: GMII Operation Command 0 is enabled
1	RW	0x0	C45E Clause 45 PHY Enable When this bit is set, Clause 45 capable PHY is connected to MDIO. When this bit is reset, Clause 22 capable PHY is connected to MDIO. Values: 1'b0: Clause 45 PHY is disabled 1'b1: Clause 45 PHY is enabled
0	RW	0x0	GB GMII Busy The application sets this bit to instruct the SMA to initiate a Read or Write access to the MDIO slave. The MAC clears this bit after the MDIO frame transfer is completed. Hence the software must not write or change any of the fields in MAC_MDIO_Address and MAC_MDIO_Data registers as long as this bit is set. For write transfers, the application must first write 16-bit data in the GDl field (and also RA field when C45E is set) in MAC_MDIO_Data register before setting this bit. When C45E is set, it should also write into the RA field of MAC_MDIO_Data register before initiating a read transfer. When a read transfer is completed (GB=0), the data read from the PHY register is valid in the GD field of the MAC_MDIO_Data register. Note: Even if the addressed PHY is not present, there is no change in the functionality of this bit. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. Values: 1'b0: GMII Busy is disabled 1'b1: GMII Busy is enabled

GMAC_MAC_MDIO_DATA

Address: **Operational Base** + offset (0x0204)

Bit	Attr	Reset Value	Description

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	RW	0x0	UCDBC Update MMC Counters for Dropped Broadcast Packets Note: The CNTRST bit has a higher priority than the CNTPRST bit. Therefore, when the software tries to set both bits in the same write cycle, all counters are cleared and the CNTPRST bit is not set. When set, the MAC updates all related MMC Counters for Broadcast packets that are dropped because of the setting of the DBF bit of MAC_Packet_Filter register. When reset, the MMC Counters are not updated for dropped Broadcast packets. Values: 1'b0: Update MMC Counters for Dropped Broadcast Packets is disabled 1'b1: Update MMC Counters for Dropped Broadcast Packets is enabled
7:6	RO	0x0	reserved
5	RW	0x0	CNTPRSTLVL Full-Half Preset When this bit is low and the CNTPRST bit is set, all MMC counters get preset to almost-half value. All octet counters get preset to 0x7FFF_F800 (Half 2KBytes) and all packet-counters gets preset to 0x7FFF_FFF0 (Half 16). When this bit is high and the CNTPRST bit is set, all MMC counters get preset to almost-full value. All octet counters get preset to 0xFFFF_F800 (Full 2KBytes) and all packet-counters gets preset to 0xFFFF_FFF0 (Full 16). For 16-bit counters, the almost-half preset values are 0x7800 and 0x7FF0 for the respective octet and packet counters. Similarly, the almost-full preset values for the 16-bit counters are 0xF800 and 0xFFF0. Values: 1'b0: Full-Half Preset is disabled 1'b1: Full-Half Preset is enabled
4	RW	0x0	CNTPRST Counters Preset When this bit is set, all counters are initialized or preset to almost full or almost half according to the CNTPRSTLVL bit. This bit is cleared automatically after 1 clock cycle. This bit, along with the CNTPRSTLVL bit, is useful for debugging and testing the assertion of interrupts because of MMC counter becoming half-full or full. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. Values: 1'b0: Counters Preset is disabled 1'b1: Counters Preset is enabled

Address: **Operational Base** + offset (0x08C4)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3	RW	0x0	FCIM MMC Rx FPE Fragment Counter Interrupt Mask Setting this bit masks the interrupt when the Tx_FPE_Fragment_Cntr counter reaches half of the maximum value or the maximum value. Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration. Values: 0x0 (DISABLE): MMC Rx FPE Fragment Counter Interrupt Mask is disabled 0x1 (ENABLE): MMC Rx FPE Fragment Counter Interrupt Mask is enabled
2	RW	0x0	PAOCIM MMC Rx Packet Assembly OK Counter Interrupt Mask Setting this bit masks the interrupt when the Rx_Packet_Assemble_Ok_Cntr counter reaches half of the maximum value or the maximum value. Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration. Values: 0x0 (DISABLE): MMC Rx Packet Assembly OK Counter Interrupt Mask is disabled 0x1 (ENABLE): MMC Rx Packet Assembly OK Counter Interrupt Mask is enabled
1	RW	0x0	PSECIM MMC Rx Packet SMD Error Counter Interrupt Mask Setting this bit masks the interrupt when the Rx_Packet_SMD_Err_Cntr counter reaches half of the maximum value or the maximum value. Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration. Values: 0x0 (DISABLE): MMC Rx Packet SMD Error Counter Interrupt Mask is disabled 0x1 (ENABLE): MMC Rx Packet SMD Error Counter Interrupt Mask is enabled

Bit	Attr	Reset Value	Description
0	RW	0x0	PAECIM MMC Rx Packet Assembly Error Counter Interrupt Mask Setting this bit masks the interrupt when the Rx_Packet_Assemble_Err_Cntr counter reaches half of the maximum value or the maximum value. Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration. Values: 0x0 (DISABLE): MMC Rx Packet Assembly Error Counter Interrupt Mask is disabled 0x1 (ENABLE): MMC Rx Packet Assembly Error Counter Interrupt Mask is enabled

GMAC_MMC_RX_PACKET_ASM_ERR_CNTR

Address: **Operational Base** + offset (0x08C8)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	PAEC Rx Packet Assembly Error Counter This field indicates the number of MAC frames with reassembly errors on the Receiver, due to mismatch in the Fragment Count value. Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration.

GMAC_MMC_RX_PACKET_SMD_ERR_CNTR

Address: **Operational Base** + offset (0x08CC)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	PSEC Rx Packet SMD Error Counter This field indicates the number of MAC frames rejected due to unknown SMD value and MAC frame fragments rejected due to arriving with an SMD-C when there was no preceding preempted frame. Exists when at least one of the RX/TX MMC counters are enabled during FPE Enabled configuration.

GMAC_MMC_RX_PACKET_ASSEMBLY_OK_CNTR

Address: **Operational Base** + offset (0x08D0)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	PAOC Rx Packet Assembly OK Counter This field indicates the number of MAC frames that were successfully reassembled and delivered to MAC. Exists when at least one of the RX/TX MMC counters are enabled during FPE Enabled configuration.

GMAC_MMC_RX_FPE_FRAGMENT_CNTR

Address: **Operational Base** + offset (0x08D4)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	FFC Rx FPE Fragment Counter This field indicates the number of additional mPackets received due to preemption. Exists when at least one of the RX/TX MMC counters are enabled during FPE Enabled configuration.

GMAC_MAC_L3_L4_CONTROL0

Address: **Operational Base** + offset (0x0900)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28	RW	0x0	DMCHEN0 DMA Channel Select Enable When set, this bit enables the selection of the DMA channel number for the packet that is passed by this L3_L4 filter. The DMA channel is indicated by the DMCHN bits. When this bit is reset, the DMA channel is not decided by this filter. Values: 0x0 (DISABLE): DMA Channel Select is disabled 0x1 (ENABLE): DMA Channel Select is enabled
27:25	RO	0x0	reserved
24	RW	0x0	DMCHN0 DMA Channel Number When DMCHEN is set high, this field selects the DMA Channel number to which the packet passed by this filter is routed. The width of this field depends on the number of the DMA channels present in your configuration.
23:22	RO	0x0	reserved
21	RW	0x0	L4DPIM0 Layer 4 Destination Port Inverse Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Destination Port number field is enabled for perfect matching. This bit is valid and applicable only when the L4DPM0 bit is set high. Values: 0x0 (DISABLE): Layer 4 Destination Port Inverse Match is disabled 0x1 (ENABLE): Layer 4 Destination Port Inverse Match is enabled
20	RW	0x0	L4DPM0 Layer 4 Destination Port Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Destination Port number field for matching. Values: 0x0 (DISABLE): Layer 4 Destination Port Match is disabled 0x1 (ENABLE): Layer 4 Destination Port Match is enabled
19	RW	0x0	L4SPIM0 Layer 4 Source Port Inverse Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Source Port number field is enabled for perfect matching. This bit is valid and applicable only when the L4SPM0 bit is set high. Values: 0x0 (DISABLE): Layer 4 Source Port Inverse Match is disabled 0x1 (ENABLE): Layer 4 Source Port Inverse Match is enabled

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
18	RW	0x0	L4SPM0 Layer 4 Source Port Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Source Port number field for matching. Values: 0x0 (DISABLE): Layer 4 Source Port Match is disabled 0x1 (ENABLE): Layer 4 Source Port Match is enabled
17	RO	0x0	reserved
16	RW	0x0	L4PEN0 Layer 4 Protocol Enable When this bit is set, the Source and Destination Port number fields of UDP packets are used for matching. When this bit is reset, the Source and Destination Port number fields of TCP packets are used for matching. The Layer 4 matching is done only when the L4SPM0 or L4DPM0 bit is set. Values: 0x0 (DISABLE): Layer 4 Protocol is disabled 0x1 (ENABLE): Layer 4 Protocol is enabled
15:11	RW	0x00	L3HDBM0 Layer 3 IP DA Higher Bits Match IPv4 Packets: This field contains the number of higher bits of IP Destination Address that are matched in the IPv4 packets. The following list describes the values of this field: 0: No bits are masked. 1: LSb[0] is masked 2: Two LSbs [1:0] are masked .. 31: All bits except MSb are masked. IPv6 Packets: Bits[12:11] of this field correspond to Bits[6:5] of L3HSBM0 which indicate the number of lower bits of IP Source or Destination Address that are masked in the IPv6 packets. The following list describes the concatenated values of the L3HDBM0[1:0] and L3HSBM0 bits: 0: No bits are masked. 1: LSb[0] is masked. 2: Two LSbs [1:0] are masked .. 127: All bits except MSb are masked. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set.

31:0	RW	0x00000000	L3A30 Layer 3 Address 3 Field When the L3PEN0 and L3SAM0 bits are set in the MAC_L3_L4_Control0 register, this field contains the value to be matched with Bits[127:96] of the IP Source Address field in the IPv6 packets. When the L3PEN0 and L3DAM0 bits are set in the MAC_L3_L4_Control0 register, this field contains the value to be matched with Bits[127:96] of the IP Destination Address field in the IPv6 packets. When the L3PEN0 bit is reset in the MAC_L3_L4_Control0 register, this field is not used.

GMAC_MAC_TIMESTAMP_CONTROL

Address: **Operational Base** + offset (0x0B00)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28	RW	0x0	AV8021ASMEN AV 802.1AS Mode Enable When this bit is set, the MAC processes only untagged PTP over Ethernet packets for providing PTP status and capturing timestamp snapshots, that is, IEEE 802.1AS mode of operation. When PTP offload feature is enabled, for the purpose of PTP offload, the transport specific field in the PTP header is generated and checked based on the value of this bit. Values: 1'b0: AV 802.1AS Mode is disabled 1'b1: AV 802.1AS Mode is enabled
27:25	RO	0x0	reserved
24	RW	0x0	TXTSSTSM Transmit Timestamp Status Mode When this bit is set, the MAC overwrites the earlier transmit timestamp status even if it is not read by the software. The MAC indicates this by setting the TXTSSMIS bit of the MAC_Tx_Timestamp_Status_Nanoseconds register. When this bit is reset, the MAC ignores the timestamp status of current packet if the timestamp status of previous packet is not read by the software. The MAC indicates this by setting the TXTSSMIS bit of the MAC_Tx_Timestamp_Status_Nanoseconds register. Values: 1'b0: Transmit Timestamp Status Mode is disabled 1'b1: Transmit Timestamp Status Mode is enabled
23:19	RO	0x00	reserved

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
18	RW	0x0	TSENMACADDR Enable MAC Address for PTP Packet Filtering When this bit is set, the DA MAC address (that matches any MAC Address register) is used to filter the PTP packets when PTP is directly sent over Ethernet. When this bit is set, received PTP packets with DA containing a special multicast or unicast address that matches the one programmed in MAC address registers are considered for processing as indicated below, when PTP is directly sent over Ethernet. For normal time stamping operation, MAC address registers 0 to 31 is considered for unicast destination address matching. For PTP offload, only MAC address register 0 is considered for unicast destination address matching. Values: 1'b0: MAC Address for PTP Packet Filtering is disabled 1'b1: MAC Address for PTP Packet Filtering is enabled
17:16	RW	0x0	SNAPTYPSEL Select PTP packets for Taking Snapshots These bits, along with Bits 15 and 14, decide the set of PTP packet types for which snapshot needs to be taken. The encoding is given in Timestamp Snapshot Dependency on Register Bits Table.
15	RW	0x0	TSMSTRENA Enable Snapshot for Messages Relevant to Master When this bit is set, the snapshot is taken only for the messages that are relevant to the master node. Otherwise, the snapshot is taken for the messages relevant to the slave node. Values: 1'b0: Snapshot for Messages Relevant to Master is disabled 1'b1: Snapshot for Messages Relevant to Master is enabled
14	RW	0x0	TSEVNTENA Enable Timestamp Snapshot for Event Messages When this bit is set, the timestamp snapshot is taken only for event messages (SYNC, Delay_Req, Pdelay_Req, or Pdelay_Resp). When this bit is reset, the snapshot is taken for all messages except Announce, Management, and Signaling. For more information about the timestamp snapshots, see Timestamp Snapshot Dependency on Register Bits Table. Values: 1'b0: Timestamp Snapshot for Event Messages is disabled 1'b1: Timestamp Snapshot for Event Messages is enabled
13	RW	0x0	TSIPV4ENA Enable Processing of PTP Packets Sent over IPv4-UDP When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv4-UDP packets. When this bit is reset, the MAC ignores the PTP transported over IPv4-UDP packets. This bit is set by default. Values: 1'b0: Processing of PTP Packets Sent over IPv4-UDP is disabled 1'b1: Processing of PTP Packets Sent over IPv4-UDP is enabled

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
12	RW	0x0	TSIPV6ENA Enable Processing of PTP Packets Sent over IPv6-UDP When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv6-UDP packets. When this bit is clear, the MAC ignores the PTP transported over IPv6-UDP packets. Values: 1'b0: Processing of PTP Packets Sent over IPv6-UDP is disabled 1'b1: Processing of PTP Packets Sent over IPv6-UDP is enabled
11	RW	0x0	TSIPENA Enable Processing of PTP over Ethernet Packets When this bit is set, the MAC receiver processes the PTP packets encapsulated directly in the Ethernet packets. When this bit is reset, the MAC ignores the PTP over Ethernet packets. Values: 1'b0: Processing of PTP over Ethernet Packets is disabled 1'b1: Processing of PTP over Ethernet Packets is enabled
10	RW	0x0	TSVER2ENA Enable PTP Packet Processing for Version 2 Format When this bit is set, the IEEE 1588 version 2 format is used to process the PTP packets. When this bit is reset, the IEEE 1588 version 1 format is used to process the PTP packets. The IEEE 1588 formats are described in 'PTP Processing and Control'. Values: 1'b0: PTP Packet Processing for Version 2 Format is disabled 1'b1: PTP Packet Processing for Version 2 Format is enabled
9	RW	0x0	TSCTRLSSR Timestamp Digital or Binary Rollover Control When this bit is set, the Timestamp Low register rolls over after 0x3B9A_C9FF value (that is, 1 nanosecond accuracy) and increments the timestamp (High) seconds. When this bit is reset, the rollover value of sub-second register is 0x7FFF_FFFF. The sub-second increment must be programmed correctly depending on the PTP reference clock frequency and the value of this bit. Values: 1'b0: Timestamp Digital or Binary Rollover Control is disabled 1'b1: Timestamp Digital or Binary Rollover Control is enabled
8	RW	0x0	TSENALL Enable Timestamp for All Packets When this bit is set, the timestamp snapshot is enabled for all packets received by the MAC. Values: 1'b0: Timestamp for All Packets disabled 1'b1: Timestamp for All Packets enabled
7	RO	0x0	reserved
6	RW	0x0	PTGE Presentation Time Generation Enable When this bit is set the Presentation Time generation will be enabled. Values: 0x0 (DISABLE): Presentation Time Generation is disabled 0x1 (ENABLE): Presentation Time Generation is enabled

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
5	RW	0x0	TSADDREG Update Addend Register When this bit is set, the content of the Timestamp Addend register is updated in the PTP block for fine correction. This bit is cleared when the update is complete. This bit should be zero before it is set. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. Values: 1'b0: Addend Register is not updated 1'b1: Addend Register is updated
4	RO	0x0	reserved
3	RW	0x0	TSUPDT Update Timestamp When this bit is set, the system time is updated (added or subtracted) with the value specified in MAC_System_Time_Seconds_Update and MAC_System_Time_Nanoseconds_Update registers. This bit should be zero before updating it. This bit is reset when the update is complete in hardware. The Timestamp Higher Word register (if enabled during core configuration) is not updated.When Media Clock Generation and Recovery is configured (DWC_EQOS_FLEXI_PPS_OUT_EN) and enabled MAC_Presn_Time_Updt should also be updated before setting this field. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. Values: 1'b0: Timestamp is not updated 1'b1: Timestamp is updated
2	RW	0x0	TSINIT Initalize Timestamp When this bit is set, the system time is initialized (overwritten) with the value specified in the MAC_System_Time_Seconds_Update and MAC_System_Time_Nanoseconds_Update registers. This bit should be zero before it is updated. This bit is reset when the initialization is complete. The Timestamp Higher Word register (if enabled during core configuration) can only be initialized.When Media Clock Generation and Recovery is configured (DWC_EQOS_FLEXI_PPS_OUT_EN) and enabled MAC_Presn_Time_Updt should also be updated before setting this field. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. Values: 1'b0: Timestamp is not initialized 1'b1: Timestamp is initialized
1	RW	0x0	TSCFUPDT Fine or Coarse Timestamp Update When this bit is set, the Fine method is used to update system timestamp. When this bit is reset, Coarse method is used to update the system timestamp. Values: 1'b0: Coarse method is used to update system timestamp 1'b1: Fine method is used to update system timestamp

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
0	RW	0x0	TSENA Enable Timestamp When this bit is set, the timestamp is added for Transmit and Receive packets. When disabled, timestamp is not added for transmit and receive packets and the Timestamp Generator is also suspended. You need to initialize the Timestamp (system time) after enabling this mode.On the Receive side, the MAC processes the 1588 packets only if this bit is set. Values: 1'b0: Timestamp is disabled 1'b1: Timestamp is enabled

GMAC_MAC_SUB_SECOND_INCREMENT

Address: **Operational Base** + offset (0x0B04)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RW	0x00	SSINC Sub-second Increment Value The value programmed in this field is accumulated every clock cycle (of clk_ptp_i) with the contents of the sub-second register. For example, when the PTP clock is 50 MHz (period is 20 ns), you should program 20 (0x14) when the System Time Nanoseconds register has an accuracy of 1 ns [Bit 9 (TSCTRLSSR) is set in MAC_Timestamp_Control]. When TSCTRLSSR is clear, the Nanoseconds register has a resolution of ~0.465 ns. In this case, you should program a value of 43 (0x2B) which is derived by 20 ns/0.465.
15:0	RO	0x0000	reserved

GMAC_MAC_SYSTEM_TIME_SECS

Address: **Operational Base** + offset (0x0B08)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	TSS Timestamp Second The value in this field indicates the current value in seconds of the System Time maintained by the MAC.

GMAC_MAC_SYSTEM_TIME_NS

Address: **Operational Base** + offset (0x0B0C)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30:0	RW	0x00000000	TSSS Timestamp Sub Seconds The value in this field has the sub-second representation of time, with an accuracy of 0.46 ns. When Bit 9 is set in MAC_Timestamp_Control, each bit represents 1 ns. The maximum value is 0x3B9A_C9FF after which it rolls-over to zero.

GMAC_MAC_SYS_TIME_SECS_UPDATE

Address: **Operational Base** + offset (0x0B10)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	TSS Timestamp Seconds The value in this field is the seconds part of the update. When ADDSUB is reset, this field must be programmed with the seconds part of the update value. When ADDSUB is set, this field must be programmed with the complement of the seconds part of the update value. For example, if 2.000000001 seconds need to be subtracted from the system time, the TSS field in the MAC_Timestamp_Seconds_Update register must be 0xFFFF_FFFE (that is, 2^32 - 2).

GMAC_MAC_SYS_TIME_NS_UPDATE

Address: **Operational Base** + offset (0x0B14)

Bit	Attr	Reset Value	Description
31	RW	0x0	ADDSUB Add or Subtract Time When this bit is set, the time value is subtracted with the contents of the update register. When this bit is reset, the time value is added with the contents of the update register. Values: 1'b0: Add time 1'b1: Subtract time
30:0	RW	0x00000000	TSSS Timestamp Sub Seconds The value in this field is the sub-seconds part of the update. When ADDSUB is reset, this field must be programmed with the sub-seconds part of the update value, with an accuracy based on the TSCTRLSSR bit of the MAC_Timestamp_Control register.When ADDSUB is set, this field must be programmed with the complement of the sub-seconds part of the update value as described below. When TSCTRLSSR bit in MAC_Timestamp_Control is set, the programmed value must be 10^9 - <sub-second value>. When TSCTRLSSR bit in MAC_Timestamp_Control is reset, the programmed value must be 2^31 - <sub-second_value>. When the TSCTRLSSR bit is reset in the MAC_Timestamp_Control register, each bit represents an accuracy of 0.46 ns. When the TSCTRLSSR bit is set in the MAC_Timestamp_Control register, each bit represents 1 ns and the programmed value should not exceed 0x3B9A_C9FF. For example, if 2.000000001 seconds need to be subtracted from the system time, then the TSSS field in the MAC_Timestamp_Nanoseconds_Update register must be 0x7FFF_FFFF (that is, 2^31 - 1), when TSCTRLSSR bit in MAC_Timestamp_Control is reset and 0x3B9A_C9FF (that is, 10^9 - 1), when TSCTRLSSR bit in MAC_Timestamp_Control is set.

GMAC_MAC_TIMESTAMP_ADDEND

Address: **Operational Base** + offset (0x0B18)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	TSAR Timestamp Addend Register This field indicates the 32-bit time value to be added to the Accumulator register to achieve time synchronization.

GMAC_MAC_TIMESTAMP_STATUS

Address: **Operational Base** + offset (0x0B20)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:25	RO	0x00	ATSNS Number of Auxiliary Timestamp Snapshots This field indicates the number of Snapshots available in the FIFO. A value equal to the selected depth of FIFO (4, 8, or 16) indicates that the Auxiliary Snapshot FIFO is full. These bits are cleared (to 00000) when the Auxiliary snapshot FIFO clear bit is set. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected.
24	RO	0x0	ATSSTM Auxiliary Timestamp Snapshot Trigger Missed This bit is set when the Auxiliary timestamp snapshot FIFO is full and external trigger was set. This indicates that the latest snapshot is not stored in the FIFO. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected. Values: 1'b0: Auxiliary Timestamp Snapshot Trigger Missed status not detected 1'b1: Auxiliary Timestamp Snapshot Trigger Missed status detected
23:16	RO	0x00	reserved
15	RO	0x0	TXTSSIS Tx Timestamp Status Interrupt Status In non-EQOS_CORE configurations when drop transmit status is enabled in MTL, this bit is set when the captured transmit timestamp is updated in the MAC_Tx_Timestamp_Status_Nanoseconds and MAC_Tx_Timestamp_Status_Seconds registers. When PTP offload feature is enabled, this bit is set when the captured transmit timestamp is updated in the MAC_Tx_Timestamp_Status_Nanoseconds and MAC_Tx_Timestamp_Status_Seconds registers, for PTO generated Delay Request and Pdelay request packets. This bit is cleared when the MAC_Tx_Timestamp_Status_Seconds register is read (or write to MAC_Tx_Timestamp_Status_Seconds register when RCWE bit of MAC_CSR_SW_Ctrl register is set). Values: 1'b0: Tx Timestamp Status Interrupt status not detected 1'b1: Tx Timestamp Status Interrupt status detected
14:4	RO	0x000	reserved
3	RO	0x0	TSTRGTERR0 Timestamp Target Time Error This bit is set when the latest target time programmed in the MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds registers elapses. This bit is cleared when the application reads this bit. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: Timestamp Target Time Error status not detected 1'b1: Timestamp Target Time Error status detected

Bit	Attr	Reset Value	Description
2	RO	0x0	AUXTSTRIG Auxiliary Timestamp Trigger Snapshot This bit is set high when the auxiliary snapshot is written to the FIFO. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: Auxiliary Timestamp Trigger Snapshot status not detected 1'b1: Auxiliary Timestamp Trigger Snapshot status detected
1	RO	0x0	TSTARGT0 Timestamp Target Time Reached When set, this bit indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds registers. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: Timestamp Target Time Reached status not detected 1'b1: Timestamp Target Time Reached status detected
0	RO	0x0	TSSOVF Timestamp Seconds Overflow When this bit is set, it indicates that the seconds value of the timestamp (when supporting version 2 format) has overflowed beyond 32'hFFFF_FFFF. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. Values: 1'b0: Timestamp Seconds Overflow status not detected 1'b1: Timestamp Seconds Overflow status detected

GMAC_MAC_TX_TS_STATUS_NS

Address: **Operational Base** + offset (0x0B30)

Bit	Attr	Reset Value	Description
31	RO	0x0	TXTSSMIS Transmit Timestamp Status Missed When this bit is set, it indicates one of the following: 1. The timestamp of the current packet is ignored if TXTSSTSM bit of the MAC_Timestamp_Control register is reset. 2. The timestamp of the previous packet is overwritten with timestamp of the current packet if TXTSSTSM bit of the MAC_Timestamp_Control register is set. Access restriction applies. Clears on read. Self-set to 1 on internal event. Values: 1'b0: Transmit Timestamp Status Missed status not detected 1'b1: Transmit Timestamp Status Missed status detected
30:0	RO	0x00000000	TXTSSLO Transmit Timestamp Status Low This field contains the 31 bits of the Nanoseconds field of the Transmit packet's captured timestamp.

Bit	Attr	Reset Value	Description
7	RW	0x0	MCGREN0 MCGR Mode Enable for PPS0 Output This field enables the 0th PPS instance to operate in PPS or MCGR mode. When set it operates in MCGR mode and on reset it operates in PPS mode. Values: 0x0 (PPS): 0th PPS instance is enabled to operate in PPS mode 0x1 (MCGR): 0th PPS instance is enabled to operate in MCGR mode
6:5	RW	0x0	TRGTMODSEL0 Target Time Register Mode for PPS0 Output This field indicates the Target Time registers (MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds) mode for PPS0 output signal: Values: 0x0 (ONLY_INT): Target Time registers are programmed only for generating the interrupt event. The Flexible PPS function must not be enabled in this mode, otherwise spurious transitions may be observed on the corresponding ptp_pps_o output port 0x1 (RSVD): Reserved 0x2 (INT_ST): Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS0 output signal generation 0x3 (ONLY_ST): Target Time registers are programmed only for starting or stopping the PPS0 output signal generation. No interrupt is asserted
4	RW	0x0	PPSEN0 Flexible PPS Output Mode Enable When this bit is set, Bits[3:0] function as PPSCMD. When this bit is reset, Bits[3:0] function as PPSCTRL (Fixed PPS mode). Values: 0x0 (DISABLE): Flexible PPS Output Mode is disabled 0x1 (ENABLE): Flexible PPS Output Mode is enabled

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
3:0	RW	0x0	PPSCTRL_PPSCMD PPS Output Frequency Control This field controls the frequency of the PPS0 output (ptp_pps_o[0]) signal. The default value of PPSCTRL is 0000, and the PPS output is 1 pulse (of width clk_ptp_i) every second. For other values of PPSCTRL, the PPS output becomes a generated clock of following frequencies: 4'b0001: The binary rollover is 2 Hz, and the digital rollover is 1 Hz. 4'b0010: The binary rollover is 4 Hz, and the digital rollover is 2 Hz. 4'b0011: The binary rollover is 8 Hz, and the digital rollover is 4 Hz. 4'b0100: The binary rollover is 16 Hz, and the digital rollover is 8 Hz. ... 4'b1111: The binary rollover is 32.768 KHz and the digital rollover is 16.384 KHz. Note: In the binary rollover mode, the PPS output (ptp_pps_o) has a duty cycle of 50 percent with these frequencies. In the digital rollover mode, the PPS output frequency is an average number. The actual clock is of different frequency that gets synchronized every second. For example: 1. When PPSCTRL = 0001, the PPS (1 Hz) has a low period of 537 ms and a high period of 463 ms. 2. When PPSCTRL = 0010, the PPS (2 Hz) is a sequence of One clock of 50 percent duty cycle and 537 ms period Second clock of 463 ms period (268 ms low and 195 ms high). 3. When PPSCTRL = 0011, the PPS (4 Hz) is a sequence of Three clocks of 50 percent duty cycle and 268 ms period Fourth clock of 195 ms period (134 ms low and 61 ms high). This behavior is because of the non-linear toggling of bits in the digital rollover mode in the MAC_System_Time_Nanoseconds register.

GMAC_MAC_PPS0_TARGET_TIME_SECONDS

Address: **Operational Base** + offset (0x0B80)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	TSTRH0 PPS Target Time Seconds Register This field stores the time in seconds. When the timestamp value matches or exceeds both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on Target Time mode selected for the corresponding PPS output in the MAC_PPS_Control register. If DWC_EQOS_FLEXI_PPS_OUT_EN is enabled in the configuration and PTGE field of MAC_Timestamp_Control Register is set with Presentation time control set in recovery mode, then these bits indicate the TPT being programmed by the application and in generation mode it indicates the CPT generated at the sampled trigger.

GMAC_MAC_PPS0_TARGET_TIME_NS

Address: **Operational Base** + offset (0x0B84)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31	RW	0x0	TRGTBUSY0 PPS Target Time Register Busy The MAC sets this bit when the PPSCMD0 field in the MAC_PPS_Control register is programmed to 010 or 011. Programming the PPSCMD0 field to 010 or 011 instructs the MAC to synchronize the Target Time Registers to the PTP clock domain.The MAC clears this bit after synchronizing the Target Time Registers to the PTP clock domain The application must not update the Target Time Registers when this bit is read as 1. Otherwise, the synchronization of the previous programmed timegets corrupted. Values: 0x0 (INACTIVE): PPS Target Time Register Busy status is not detected 0x1 (ACTIVE): PPS Target Time Register Busy is detected
30:0	RW	0x00000000	TTSL0 Target Time Low for PPS Register This register stores the time in (signed) nanoseconds. When the value of the timestamp matches the value in both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on the TRGTMODSEL0 field (Bits [6:5]) in MAC_PPS_Control. When the TSCTRLSSR bit is reset in the MAC_Timestamp_Control register, this value should be (time in ns / 0.465). The actual start or stop time of the PPS signal output may have an error margin up to one unit of sub-second increment value. When the TSCTRLSSR bit is set in the MAC_Timestamp_Control register, this value should not exceed 0x3B9A_C9FF. The actual start or stop time of the PPS signal output may have an error margin up to one unit of sub-second increment value. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.

GMAC_MAC_PPS0_INTERVAL

Address: **Operational Base** + offset (0x0B88)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	PPSINT0 PPS Output Signal Interval These bits store the interval between the rising edges of PPS0 signal output. The interval is stored in terms of number of units of sub-second increment value. You need to program one value less than the required interval. For example, if the PTP reference clock is 50 MHz (period of 20 ns), and desired interval between the rising edges of PPS0 signal output is 100 ns (that is, 5 units of sub-second increment value), you should program value 4 (5-1) in this register.

GMAC_MAC_PPS0_WIDTH

Address: **Operational Base** + offset (0x0B8C)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	PPSWIDTH0 PPS Output Signal Width These bits store the width between the rising edge and corresponding falling edge of PPS0 signal output. The width is stored in terms of number of units of sub-second increment value. You need to program one value less than the required interval. For example, if PTP reference clock is 50 MHz (period of 20 ns), and width between the rising and corresponding falling edges of PPS0 signal output is 80 ns (that is, four units of sub-second increment value), you should program value 3 (4-1) in this register. Note: The value programmed in this register must be lesser than the value programmed in MAC_PPS0_Interval.

GMAC_MTL_OPERATION_MODE

Address: **Operational Base** + offset (0x0C00)

Bit	Attr	Reset Value	Description
8	RW	0x0	Q1MDMACH Queue 1 Mapped to DMA Channel This field controls the routing of the received packet in Queue 1 to the DMA channel: 000: DMA Channel 0 001: DMA Channel 1 010: DMA Channel 2 011: DMA Channel 3 100: DMA Channel 4 101: DMA Channel 5 110: DMA Channel 6 111: DMA Channel 7 This field is valid when the Q1DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values may be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.
7:5	RO	0x0	reserved
4	RW	0x0	Q0DDMACH Queue 0 Enabled for DA-based DMA Channel Selection When set, this bit indicates that the packets received in Queue 0 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 0 are routed to the DMA Channel programmed in the Q0MDMACH field. Values: 0x0 (DISABLE): Queue 0 disabled for DA-based DMA Channel Selection 0x1 (ENABLE): Queue 0 enabled for DA-based DMA Channel Selection
3:1	RO	0x0	reserved
0	RW	0x0	Q0MDMACH Queue 0 Mapped to DMA Channel This field controls the routing of the packet received in Queue 0 to the DMA channel: 000: DMA Channel 0 001: DMA Channel 1 010: DMA Channel 2 011: DMA Channel 3 100: DMA Channel 4 101: DMA Channel 5 110: DMA Channel 6 111: DMA Channel 7 This field is valid when the Q0DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values may be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.

GMAC_MTL_TBS_CTRL

Address: **Operational Base** + offset (0x0C40)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:8	RW	0x000000	LEOS Launch Expiry Offset The value in units of 256 nanoseconds that has to be added to the Launch time to compute the Launch Expiry time. Value valid only when LEOV is set. Max value: 999,999,999 ns, additionally should be smaller than CTR-1 value when ESTM mode is set since this value is a modulo CTR value.
7	RO	0x0	reserved
6:4	RW	0x0	LEGOS Launch Expiry GSN Offset The number GSN slots that has to be added to the Launch GSN to compute the Launch Expiry time. Value valid only when LEOV is set.
3:2	RO	0x0	reserved
1	RW	0x0	LEOV Launch Expiry Offset Valid When set indicates the LEOS field is valid. When not set, indicates the Launch Expiry Offset is not valid and the MTL must not check for Launch expiry time. Values: 0x0 (INVALID): LEOS field is invalid 0x1 (VALID): LEOS field is valid
0	RW	0x0	ESTM EST offset Mode When this bit is set, the Launch Time value used in Time Based Scheduling is interpreted as an EST offset value and is added to the Base Time Register (BTR) of the current list. When reset, the Launch Time value is used as an absolute value that should be compared with the System time [39:8]. Values: 0x0 (DISABLE): EST offset Mode is disabled 0x1 (ENABLE): EST offset Mode is enabled

GMAC_MTL_EST_CONTROL

Address: **Operational Base** + offset (0x0C50)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	PTOV PTP Time Offset Value The value of PTP Clock period multiplied by 6 in nanoseconds. This value is needed to avoid transmission overruns at the beginning of the installation of a new GCL.
23	RO	0x0	reserved
22:11	RW	0x000	CTOV Current Time Offset Value Provides a 12 bit time offset value in nano second that is added to the current time to compensate for all the implementation pipeline delays such as the CDC sync delay, buffering delays, data path delays etc. This offset helps to ensure that the impact of gate controls is visible on the line exactly at the pre-determined schedule (or as close to the schedule as possible).

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
10:8	RW	0x0	TILS Time Interval Left Shift Amount This field provides the left shift amount for the programmed Time Interval values used in the Gate Control Lists. 000: No left shift needed (equal to x1ns) 001: Left shift TI by 1 bit (equal to x2ns) 010: Left shift TI by 2 bits (equal to x4ns) ... 100: Left shift TI by 7 bits (equal to x128ns) Based on the configuration one or more bits of this field should be treated as Reserved/Read-Only.
7:6	RW	0x0	LCSE Loop Count to report Scheduling Error Programmable number of GCL list iterations before reporting an HLBS error defined in EST_Status register. Values: 0x0 (4_ITERNS): 4 iterations 0x1 (8_ITERNS): 8 iterations 0x2 (16_ITERNS): 16 iterations 0x3 (32_ITERNS): 32 iterations
5	RW	0x0	DFBS Drop Frames causing Scheduling Error When set frames reported to cause HOL Blocking due to not getting scheduled (HLBS field of EST_Status register) after 4,8,16,32 (based on LCSE field of this register) GCL iterations are dropped. Values: 0x0 (DONT_DROP): Do not Drop Frames causing Scheduling Error 0x1 (DROP): Drop Frames causing Scheduling Error
4	RW	0x0	DDBF Do not Drop frames during Frame Size Error When set, frames are not be dropped during Head-of-Line blocking due to Frame Size Error (HLBF field of EST_Status register). Values: 0x0 (DROP): Drop frames during Frame Size Error 0x1 (DONT_DROP): Do not Drop frames during Frame Size Error
3:2	RO	0x0	reserved
1	RW	0x0	SSWL Switch to S/W owned list When set indicates that the software has programmed that list that it currently owns (SWOL) and the hardware should switch to the new list based on the new BTR. Hardware clears this bit when the switch to the SWOL happens to indicate the completion of the switch or when an BTR error (BTRE in Status register) is set. When BTRE is set this bit is cleared but SWOL is not updated as the switch was not successful. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. Values: 0x0 (DISABLE): Switch to S/W owned list is disabled 0x1 (ENABLE): Switch to S/W owned list is enabled

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
0	RW	0x0	EEST Enable EST When reset, the gate control list processing is halted and all gates are assumed to be in Open state. Should be set for the hardware to start processing the gate control lists. During the toggle from 0 to 1, the gate control list processing starts only after the SSWL bit it set. When DWC_EQOS_ASP_ECC is selected during the configuration, if any uncorrectable error is detected in the EST memory the hardware will reset this bit and disable the EST function. Values: 0x0 (DISABLE): EST is disabled 0x1 (ENABLE): EST is enabled

GMAC_MTL_EST_STATUS

Address: **Operational Base** + offset (0x0C58)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19:16	RO	0x0	CGSN Current GCL Slot Number Indicates the slot number of the GCL list. Slot number is a modulo 16 count of the GCL List loops executed so far. Even if a new GCL list is installed, the count is incremental.
15:12	RO	0x0	reserved
11:8	RO	0x0	BTRL BTR Error Loop Count Provides the minimum count (N) for which the equation Current Time =< New BTR + (N * New Cycle Time) becomes true. N = "1111" indicates the iterations exceeded the value of 8 and the hardware was not able to update New BTR to be equal to or greater than Current Time. Software intervention is needed to update the New BTR. Value cleared when BTRE field of this register is cleared.
7	RO	0x0	SWOL S/W owned list When '0' indicates Gate control list number "0" is owned by software and when "1" indicates the Gate Control list "1" is owned by the software. Any reads/writes by the software (using indirect access via GCL_Control) is directed to the list indicated by this value by default. The inverse of this value is treated as HWOL. R/W operations performed by hardware are directed to the list pointed by HWOL by default. Values: 0x0 (INACTIVE): Gate control list number "0" is owned by software 0x1 (ACTIVE): Gate control list number "1" is owned by software
6:5	RO	0x0	reserved

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
4	RW	0x0	CGCE Constant Gate Control Error This error occurs when the list length (LLR) is 1 and the programmed Time Interval (TI) value after the optional Left Shifting is less than or equal to the Cycle Time (CTR). The above programming implies Gates are either always Closed or always Open based on the Gate Control values; the same effect can be achieved by other simpler (non TSN) programming mechanisms. Since the implementation does not support such a programming an error is reported. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. Values: 0x0 (INACTIVE): Constant Gate Control Error not detected 0x1 (ACTIVE): Constant Gate Control Error detected
3	RO	0x0	HLBS Head-Of-Line Blocking due to Scheduling Set when the frame is not able to win arbitration and get scheduled even after 4 iterations of the GCL. Indicates to software a potential programming error. The one hot encoded values of the Queue Numbers that are not able to make progress are indicated in the MTL_EST_Sch_Error register. Bit cleared when MTL_EST_Sch_Error register is all zeros. Values: 0x0 (INACTIVE): Head-Of-Line Blocking due to Scheduling not detected 0x1 (ACTIVE): Head-Of-Line Blocking due to Scheduling detected
2	RO	0x0	HLBF Head-Of-Line Blocking due to Frame Size Set when HOL Blocking is noticed on one or more Queues as a result of none of the Time Intervals of gate open in the GCL being greater than or equal to the duration needed for frame size (or frame fragment size when preemption is enabled) transmission. The one hot encoded Queue numbers that are experiencing HLBF are indicated in the MTL_EST_Frm_Size_Error register. Additionally, the first Queue number that experienced HLBF along with the frame size is captured in MTL_EST_Frm_Size_Capture register. Bit cleared when MTL_EST_Frame_Size_ Error register is all zeros. Values: 0x0 (INACTIVE): Head-Of-Line Blocking due to Frame Size not detected 0x1 (ACTIVE): Head-Of-Line Blocking due to Frame Size detected

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
1	RW	0x0	BTRE BTR Error When "1" indicates a programming error in the BTR of SWOL where the programmed value is less than current time. If the BTRL = "1111", SWOL is not updated and Software should reprogram the BTR to a value greater than current time and then set SSWL to reinitiate the switch to SWOL. Else if the value of BTRL < "1111", SWOL is updated and this field indicates the number of iterations (of + CycleTime) taken by hardware to update the BTR to a value greater than Current Time. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. Values: 0x0 (INACTIVE): BTR Error not detected 0x1 (ACTIVE): BTR Error detected
0	RW	0x0	SWLC Switch to S/W owned list Complete When "1" indicates the hardware has successfully switched to the SWOL, and the SWOL bit has been updated to that effect. Cleared when the SSWL of EST_Control register transitions from 0 to 1, or on a software write. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. Values: 0x0 (INACTIVE): Switch to S/W owned list Complete not detected 0x1 (ACTIVE): Switch to S/W owned list Complete detected

Bit	Attr	Reset Value	Description
15:8	RW	0x00	ADDR Gate Control List Address: (GCLA when GCRR is "0"). Provides the address (row number) of the Gate Control List at which the R/W operation has to be performed. By default the Gate Control List pointed by SWOL of MTL_EST_Status is selected for R/W, however if the DBGM bit of this register is set, a debug mode access is given to R/W from DBGB. The width of this field is dependent on DWC_EQOS_EST_DEP; unused bits should be treated as read only. Gate Control list Related Registers Address: (GCRA when GCRR is "1"). By default the GCL related register set pointed by SWOL of MTL_EST_Status is selected for R/W, however if the DBGM bit of this register is set, a debug mode access is given to R/W from DBGB. Lower 3 bits are only used in this mode, higher order bits are treated as dont cares. 000: BTR Low (31:0) 001: BTR High (63:31) 010: CTR Low (31:0) 011: CTR High (39:32) 100: TER (31:0) 101: LLR (n:0) (where n is (log{DWC_EQOS_EST_DEP} / log2)) Others: Reserved
7:6	RO	0x0	reserved
5	RW	0x0	DBGB Debug Mode Bank Select When set to "0" indicates R/W in debug mode should be directed to Bank 0 (GCL0 and corresponding Time related registers). When set to "1" indicates R/W in debug mode should be directed to Bank 1 (GCL1 and corresponding Time related registers). This value is used when DBGM is set and overrides by value of SWOL which is normally used. Values: 0x0 (BANK0): R/W in debug mode should be directed to Bank 0 0x1 (BANK1): R/W in debug mode should be directed to Bank 1
4	RW	0x0	DBGM Debug Mode When set to "1" indicates R/W in debug mode where the memory bank (for GCL and Time related registers) is explicitly provided by DBGB value, when set to "0" SWOL bit is used to determine which bank to use. Values: 0x0 (DISABLE): Debug Mode is disabled 0x1 (ENABLE): Debug Mode is enabled
3	RO	0x0	reserved
2	RW	0x0	GCRR Gate Control Related Registers When set to "1" indicates the R/W access is for the GCL related registers (BTR, CTR, TER, LLR) whose address is provided by GCRA. When "0" indicates R/W should be directed to GCL from the address provided by GCLA. Values: 0x0 (DISABLE): Gate Control Related Registers are disabled 0x1 (ENABLE): Gate Control Related Registers are enabled

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
1	RW	0x0	R1W0 Read '1', Write '0': When set to '1': Read Operation When set to '0': Write Operation. Values: 0x0 (WRITE): Write Operation 0x1 (READ): Read Operation
0	RW	0x0	SRWO Start Read/Write Op When set indicates a Read/Write Op has started and is in progress. When reset by hardware indicates the R/W Op has completed or an error has occurred (when bit 20 is set) Reads: Data can be read from MTL_EST_GCL_Data register after this bit is reset. Writes: MTL_EST_GCL_Data should be programmed with write data before setting SRWO. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. Values: 0x0 (DISABLE): Start Read/Write Op disabled 0x1 (ENABLE): Start Read/Write Op enabled

GMAC_MTL_EST_GCL_DATA

Address: **Operational Base** + offset (0x0C84)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	GCD Gate Control Data The data corresponding to the address selected in the GCL_Control register. Used for both Read and Write operations.

GMAC_MTL_FPE_CTRL_STS

Address: **Operational Base** + offset (0x0C90)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28	RO	0x0	HRS Hold/Release Status 1: Indicates a Set-and-Hold-MAC operation was last executed and the pMAC is in Hold State. 0: Indicates a Set-and-Release-MAC operation was last executed and the pMAC is in Release State. Values: 0x0 (SET_REL): Indicates a Set-and-Release-MAC operation was last executed and the pMAC is in Release State 0x1 (SET_HOLD): Indicates a Set-and-Hold-MAC operation was last executed and the pMAC is in Hold State
27:10	RO	0x00000	reserved
9:8	RW	0x0	PEC Preemption Classification When set indicates the corresponding Queue must be classified as preemptable, when '0' Queue is classified as express. When both EST (Qbv) and Preemption are enabled, Queue-0 is always assumed to be preemptable. When EST (Qbv) is enabled Queues categorized as preemptable here are always assumed to be in "Open" state in the Gate Control List.
7:2	RO	0x00	reserved

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
1:0	RW	0x0	AFSZ Additional Fragment Size used to indicate, in units of 64 bytes, the minimum number of bytes over 64 bytes required in non-final fragments of preempted frames. The minimum non-final fragment size is (AFSZ +1) * 64 byte.

GMAC_MTL_FPE_ADVANCE

Address: **Operational Base** + offset (0x0C94)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	RADV Release Advance The maximum time in nanoseconds that can elapse between issuing a RELEASE to the MAC and the MAC being ready to resume transmission of preemptable frames, in the absence of there being any express frames available for transmission.
15:0	RW	0x0000	HADV Hold Advance The maximum time in nanoseconds that can elapse between issuing a HOLD to the MAC and the MAC ceasing to transmit any preemptable frame that is in the process of transmission or any preemptable frames that are queued for transmission.

GMAC_MTL_TXQ0_OPERATION_MODE

Address: **Operational Base** + offset (0x0D00)

Bit	Attr	Reset Value	Description
31:22	RO	0x000	reserved
21:16	RW	0x06	TQS Transmit Queue Size This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15:7	RO	0x000	reserved
6:4	RW	0x0	TTC Transmit Threshold Control These bits control the threshold level of the MTL Tx Queue. The transmission starts when the packet size within the MTL Tx Queue is larger than the threshold. In addition, full packets with length less than the threshold are also transmitted. These bits are used only when the TSF bit is reset. Values: 3'b000: 32 bytes 3'b001: 64 bytes 3'b010: 96 bytes 3'b011: 128 bytes 3'b100: 192 bytes 3'b101: 256 bytes 3'b110: 384 bytes 3'b111: 512 bytes

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
3:2	RW	0x0	TXQEN Transmit Queue Enable This field is used to enable/disable the transmit queue 0. 2'b00: Not enabled 2'b01: Reserved 2'b10: Enabled 2'b11: Reserved This field is Read Only in Single Queue configurations and Read Write in Multiple Queue configurations. Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. Values: 0x0 (DISABLE): Not enabled 0x1 (EN_IF_AV): Enable in AV mode (Reserved in non-AV) 0x2 (ENABLE): Enabled 0x3 (RSVD2): Reserved
1	RW	0x0	TSF Transmit Store and Forward When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. Values: 1'b0: Transmit Store and Forward is disabled 1'b1: Transmit Store and Forward is enabled
0	RW	0x0	FTQ Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TxQ1_Operation_Mode register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. Values: 1'b0: Flush Transmit Queue is disabled 1'b1: Flush Transmit Queue is enabled

GMAC_MTL_TXQ0_UNDERFLOW

22:20	RO	0x0	STXSTSF Number of Status Words in Tx Status FIFO of Queue This field indicates the current number of status in the Tx Status FIFO of this queue.When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.
19	RO	0x0	reserved
18:16	RO	0x0	PTXQ Number of Packets in the Transmit Queue This field indicates the current number of packets in the Tx Queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of packets in the Transmit queue.
15:6	RO	0x000	reserved
5	RO	0x0	TXSTSFSTS MTL Tx Status FIFO Full Status When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission. Values: 1'b0: MTL Tx Status FIFO Full status is not detected 1'b1: MTL Tx Status FIFO Full status is detected
4	RO	0x0	TXQSTS MTL Tx Queue Not Empty Status When this bit is high, it indicates that the MTL Tx Queue is not empty and some data is left for transmission. Values: 1'b0: MTL Tx Queue Not Empty status is not detected 1'b1: MTL Tx Queue Not Empty status is detected

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
3	RO	0x0	TWCSTS MTL Tx Queue Write Controller Status When high, this bit indicates that the MTL Tx Queue Write Controller is active, and it is transferring the data to the Tx Queue. Values: 1'b0: MTL Tx Queue Write Controller status is not detected 1'b1: MTL Tx Queue Write Controller status is detected
2:1	RO	0x0	TRCSTS MTL Tx Queue Read Controller Status This field indicates the state of the Tx Queue Read Controller: Values: 2'b00: Idle state 2'b01: Read state (transferring data to the MAC transmitter) 2'b10: Waiting for pending Tx Status from the MAC transmitter 2'b11: Flushing the Tx queue because of the Packet Abort request from the MAC
0	RO	0x0	TXQPAUSED Transmit Queue in Pause When this bit is high and the Rx flow control is enabled, it indicates that the Tx Queue is in the Pause condition (in the full-duplex only mode) because of the following: 1. Reception of the PFC packet for the priorities assigned to the Tx Queue when PFC is enabled 2. Reception of 802.3x Pause packet when PFC is disabled Values: 1'b0: Transmit Queue in Pause status is not detected 1'b1: Transmit Queue in Pause status is detected

GMAC_MTL_TXQ0_ETS_STATUS

Address: **Operational Base** + offset (0x0D14)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RO	0x0	ABS Average Bits per Slot This field contains the average transmitted bits per slot. When the DCB operation is enabled for Queue 0, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

GMAC_MTL_TXQ0_QUANTUM_WEIGHT

Address: **Operational Base** + offset (0x0D18)

Bit	Attr	Reset Value	Description
31:21	RO	0x000	reserved
20:0	RW	0x000000	ISCQW Quantum or Weights When the DCB operation is enabled with DWRR algorithm for Queue 0 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. When DCB operation is enabled with WFQ algorithm for Queue 0 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. The higher the programmed weights lesser the bandwidth allocated for the

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
			particular Transmit Queue. This is because the weights are used to compute the packet finish time (weights*packet_size). Lesser the finish time, higher the probability of the packet getting scheduled first and using more bandwidth. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 0 traffic, this field contains the weight for this queue. The maximum value is 0x64.Bits [20:7] must be written to zero.

GMAC_MTL_Q0_INTERRUPT_CTRL_STATUS

Address: **Operational Base** + offset (0x0D2C)

Bit	Attr	Reset Value	Description
31:25	RO	0x00	reserved
24	RW	0x0	RXOIE Receive Queue Overflow Interrupt Enable When this bit is set, the Receive Queue Overflow interrupt is enabled. When this bit is reset, the Receive Queue Overflow interrupt is disabled. Values: 1'b0: Receive Queue Overflow Interrupt is disabled 1'b1: Receive Queue Overflow Interrupt is enabled
23:17	RO	0x00	reserved
16	RW	0x0	RXOVFIS Receive Queue Overflow Interrupt Status This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. Values: 1'b0: Receive Queue Overflow Interrupt Status not detected 1'b1: Receive Queue Overflow Interrupt Status detected
15:10	RO	0x00	reserved
9	RW	0x0	ABPSIE Average Bits Per Slot Interrupt Enable When this bit is set, the MAC asserts the sbd_intr_o or mci_intr_o interrupt when the average bits per slot status is updated. When this bit is cleared, the interrupt is not asserted for such an event. Values: 0x0 (DISABLE): Average Bits Per Slot Interrupt is disabled 0x1 (ENABLE): Average Bits Per Slot Interrupt is enabled
8	RW	0x0	TXUIE Transmit Queue Underflow Interrupt Enable When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled. Values: 1'b0: Transmit Queue Underflow Interrupt Status is disabled 1'b1: Transmit Queue Underflow Interrupt Status is enabled
7:2	RO	0x00	reserved

Bit	Attr	Reset Value	Description
1	RW	0x0	ABPSIS Average Bits Per Slot Interrupt Status When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. Values: 0x0 (INACTIVE): Average Bits Per Slot Interrupt Status not detected 0x1 (ACTIVE): Average Bits Per Slot Interrupt Status detected
0	RW	0x0	TXUNFIS Transmit Queue Underflow Interrupt Status This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. Values: 1'b0: Transmit Queue Underflow Interrupt Status not detected 1'b1: Transmit Queue Underflow Interrupt Status detected

GMAC_MTL_RXQ0_OPERATION_MODE

Address: **Operational Base** + offset (0x0D30)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26:20	RW	0x00	RQS Receive Queue Size This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
19:14	RW	0x00	RFD Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: 0: Full minus 1 KB, that is, FULL 1 KB 1: Full minus 1.5 KB, that is, FULL 1.5 KB 2: Full minus 2 KB, that is, FULL 2 KB 3: Full minus 2.5 KB, that is, FULL 2.5 KB ... 62: Full minus 32 KB, that is, FULL 32 KB 63: Full minus 32.5 KB, that is, FULL 32.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13:8	RW	0x00	RFA Threshold for Activating Flow Control (in half-duplex and full-duplex) These bits control the threshold (fill-level of Rx queue) at which the flow control is activated:For more information on encoding for this field, see RFD.
7	RW	0x0	EHFC Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. Values: 1'b0: Hardware Flow Control is disabled 1'b1: Hardware Flow Control is enabled
6	RW	0x0	DIS_TCP_EF Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. Values: 1'b0: Dropping of TCP/IP Checksum Error Packets is enabled 1'b1: Dropping of TCP/IP Checksum Error Packets is disabled

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
5	RW	0x0	RSF Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. Values: 1'b0: Receive Queue Store and Forward is disabled 1'b1: Receive Queue Store and Forward is enabled
4	RW	0x0	FEP Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet may be forwarded to the application or DMA. Values: 1'b0: Forward Error Packets is disabled 1'b1: Forward Error Packets is enabled
3	RW	0x0	FUP Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. Values: 1'b0: Forward Undersized Good Packets is disabled 1'b1: Forward Undersized Good Packets is enabled
2	RO	0x0	reserved
1:0	RW	0x0	RTC Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1.

Bit	Attr	Reset Value	Description
21:16	RW	0x00	TxPBL Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH0_Control register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of MTL_TxQ[n]_Operation_Mode register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	RW	0x0	IPBL Ignore PBL Requirement When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL may use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it may block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0x0 (DISABLE): Ignore PBL Requirement is disabled 0x1 (ENABLE): Ignore PBL Requirement is enabled
14:13	RW	0x0	TSE_MODE TSE Mode 00: TSO/USO (segmentation functionality is enabled). In this mode, the setting of TSE bit enables the TSO/USO segmentation. 01: UFO with Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality with Checksum for all the UDP packets. 10: UFO without Checksum (UDP Fragmentation over IPv4 with Checksum). In this mode, the setting of TSE bit enables the UDP fragmentation functionality without Checksum for all the UDP packets. 11: Reserved 0x0 (TSO_USO): TSO/USO 0x1 (UFOWC): UFO with Checksum 0x2 (UFOWOC): UFO without Checksum 0x3 (RSVD): Reserved

Bit	Attr	Reset Value	Description
12	RW	0x0	TSE TCP Segmentation Enabled When this bit is set, the DMA performs the TCP segmentation or UDP Segmentation/Fragmentation for packets in this channel. The TCP segmentation or UDP packet's segmentation/Fragmentation is done only for those packets for which the TSE bit (TDES0[19]) is set in the Tx Normal descriptor.When this bit is set, the TxPBL value must be greater than 4. 0x0 (DISABLE): TCP Segmentation is disabled 0x1 (ENABLE): TCP Segmentation is enabled
11:5	RO	0x00	reserved
4	RW	0x0	OSF Operate on Second Packet When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0x0 (DISABLE): Operate on Second Packet disabled 0x1 (ENABLE): Operate on Second Packet enabled
3:1	RO	0x0	reserved
0	RW	0x0	ST Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: 1.The current position in the list This is the base address of the Transmit list set by the DMA_CH0_TxDesc_List_Address register. 2.The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH0_Status register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH0_TxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH0_TxDesc_List_Address register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0x0 (STOP): Stop Transmission Command 0x1 (START): Start Transmission Command

GMAC_DMA_CH0_RX_CONTROL
Address: **Operational Base** + offset (0x1108)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31	RW	0x0	RPF Rx Packet Flush When this bit is set to 1, then DWC_ether_qos automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the DWC_ether_qos not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This may in turn cause head-of-line blocking in the corresponding RxQueue. 0x0 (DISABLE): Rx Packet Flush is disabled 0x1 (ENABLE): Rx Packet Flush is enabled
30:22	RO	0x000	reserved
21:16	RW	0x00	RxPBL Receive Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH0_Control register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of MTL_RxQ[n]_Operation_Mode register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	RO	0x0	reserved
14:4	RW	0x000	RBSZ_13_y Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_3_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_3_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
3:1	RO	0x0	RBSZ_3_0 Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_3_0. The RBSZ_3_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0	RW	0x0	SR Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets.The DMA tries to acquire descriptor from either of the following positions: 1.The current position in the list This is the address set by the DMA_CH0_RxDesc_List_Address register. 2.The position at which the Rx process was previously stopped If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH0_Status register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH0_RxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0x0 (STOP): Stop Receive 0x1 (START): Start Receive

Bit	Attr	Reset Value	Description
15	RW	0x0	NIS Normal Interrupt Summary Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: Bit 0: Transmit Interrupt Bit 2: Transmit Buffer Unavailable Bit 6: Receive Interrupt Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH0_Interrupt_Enable register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Normal Interrupt Summary status not detected 0x1 (ACTIVE): Normal Interrupt Summary status detected
14	RW	0x0	AIS Abnormal Interrupt Summary Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: Bit 1: Transmit Process Stopped Bit 7: Receive Buffer Unavailable Bit 8: Receive Process Stopped Bit 10: Early Transmit Interrupt Bit 12: Fatal Bus Error Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Abnormal Interrupt Summary status not detected 0x1 (ACTIVE): Abnormal Interrupt Summary status
13	RW	0x0	CDE Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Context Descriptor Error status not detected 0x1 (ACTIVE): Context Descriptor Error status detected

Bit	Attr	Reset Value	Description
12	RW	0x0	FBE Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Fatal Bus Error status not detected 0x1 (ACTIVE): Fatal Bus Error status detected
11	RW	0x0	ERI Early Receive Interrupt This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer.The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Receive Interrupt status not detected 0x1 (ACTIVE): Early Receive Interrupt status detected
10	RW	0x0	ETI Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ERIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Transmit Interrupt status not detected 0x1 (ACTIVE): Early Transmit Interrupt status detected
9	RW	0x0	RWT Receive Watchdog Timeout This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0x0 (INACTIVE): Receive Watchdog Timeout status not detected 0x1 (ACTIVE): Receive Watchdog Timeout status detected
8	RW	0x0	RPS Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Process Stopped status not detected 0x1 (ACTIVE): Receive Process Stopped status detected

Bit	Attr	Reset Value	Description
7	RW	0x0	RBU Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Buffer Unavailable status not detected 0x1 (ACTIVE): Receive Buffer Unavailable status detected
6	RW	0x0	RI Receive Interrupt This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Interrupt status not detected 0x1 (ACTIVE): Receive Interrupt status detected
5:3	RO	0x0	reserved
2	RW	0x0	TBU Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_Debug_Status0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Buffer Unavailable status not detected 0x1 (ACTIVE): Transmit Buffer Unavailable status

21:16	RW	0x06	TQS Transmit Queue Size This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits

Bit	Attr	Reset Value	Description
0	RW	0x0	FTQ Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TxQ1_Operation_Mode register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. Values: 1'b0: Flush Transmit Queue is disabled 1'b1: Flush Transmit Queue is enabled

GMAC_MTL_TXQ1_UNDERFLOW

Address: **Operational Base** + offset (0x0D44)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RO	0x0	ABS Average Bits per Slot This field contains the average transmitted bits per slot. When the DCB operation is enabled for Queue 0, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

GMAC_MTL_TXQ1_QUANTUM_WEIGHT

Address: **Operational Base** + offset (0x0D58)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:21	RO	0x000	reserved
20:0	RW	0x000000	ISCQW idleSlopeCredit, Quantum or Weights 1.idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. 2.Quantum When the DCB operation is enabled with DWRR algorithm for Queue 1 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. 3.Weights When DCB operation is enabled with WFQ algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is MTL_Operation_Mode register. Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

GMAC_MTL_TXQ1_SENDSLOPECREDIT

Address: **Operational Base** + offset (0x0D5C)

Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. Values: 1'b0: Transmit Queue Underflow Interrupt Status not detected 1'b1: Transmit Queue Underflow Interrupt Status detected

GMAC_MTL_RXQ1_OPERATION_MODE

Address: **Operational Base** + offset (0x0D70)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26:20	RW	0x00	RQS Receive Queue Size This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19:14	RW	0x00	RFD Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: 0: Full minus 1 KB, that is, FULL 1 KB 1: Full minus 1.5 KB, that is, FULL 1.5 KB 2: Full minus 2 KB, that is, FULL 2 KB 3: Full minus 2.5 KB, that is, FULL 2.5 KB ... 62: Full minus 32 KB, that is, FULL 32 KB 63: Full minus 32.5 KB, that is, FULL 32.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
13:8	RW	0x00	RFA Threshold for Activating Flow Control (in half-duplex and full-duplex) These bits control the threshold (fill-level of Rx queue) at which the flow control is activated:For more information on encoding for this field, see RFD.
7	RW	0x0	EHFC Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. Values: 1'b0: Hardware Flow Control is disabled 1'b1: Hardware Flow Control is enabled
6	RW	0x0	DIS_TCP_EF Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. Values: 1'b0: Dropping of TCP/IP Checksum Error Packets is enabled 1'b1: Dropping of TCP/IP Checksum Error Packets is disabled
5	RW	0x0	RSF Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. Values: 1'b0: Receive Queue Store and Forward is disabled 1'b1: Receive Queue Store and Forward is enabled
4	RW	0x0	FEP Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet may be forwarded to the application or DMA. Values: 1'b0: Forward Error Packets is disabled 1'b1: Forward Error Packets is enabled

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
3	RW	0x0	FUP Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. Values: 1'b0: Forward Undersized Good Packets is disabled 1'b1: Forward Undersized Good Packets is enabled
2	RO	0x0	reserved
1:0	RW	0x0	RTC Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1.

21:16	RW	0x00	TxPBL Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH0_Control register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of MTL_TxQ[n]_Operation_Mode register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	RW	0x0	IPBL Ignore PBL Requirement When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL may use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it may block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0x0 (DISABLE): Ignore PBL Requirement is disabled 0x1 (ENABLE): Ignore PBL Requirement is enabled

Bit	Attr	Reset Value	Description
0	RW	0x0	ST Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: 1.The current position in the list This is the base address of the Transmit list set by the DMA_CH1_TxDesc_List_Address register. 2.The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH1_Status register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH1_TxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH1_TxDesc_List_Address register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0x0 (STOP): Stop Transmission Command 0x1 (START): Start Transmission Command

GMAC_DMA_CH1_RX_CONTROL

Address: **Operational Base** + offset (0x1188)

Bit	Attr	Reset Value	Description
31	RW	0x0	RPF Rx Packet Flush When this bit is set to 1, then DWC_ether_qos automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the DWC_ether_qos not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This may in turn cause head-of-line blocking in the corresponding RxQueue. 0x0 (DISABLE): Rx Packet Flush is disabled 0x1 (ENABLE): Rx Packet Flush is enabled

21:16	RW	0x00	RxPBL Receive Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH0_Control register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of MTL_RxQ[n]_Operation_Mode register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15	RO	0x0	reserved
14:4	RW	0x000	RBSZ_13_y Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_3_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_3_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3:1	RO	0x0	RBSZ_3_0 Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_3_0. The RBSZ_3_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).

When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Early Transmit Interrupt status not detected 0x1 (ACTIVE): Early Transmit Interrupt status detected
9	RW	0x0	RWT Receive Watchdog Timeout This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0x0 (INACTIVE): Receive Watchdog Timeout status not detected 0x1 (ACTIVE): Receive Watchdog Timeout status detected
8	RW	0x0	RPS Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Process Stopped status not detected 0x1 (ACTIVE): Receive Process Stopped status detected
7	RW	0x0	RBU Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Buffer Unavailable status not detected 0x1 (ACTIVE): Receive Buffer Unavailable status detected

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
6	RW	0x0	RI Receive Interrupt This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Receive Interrupt status not detected 0x1 (ACTIVE): Receive Interrupt status detected
5:3	RO	0x0	reserved
2	RW	0x0	TBU Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_Debug_Status0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Buffer Unavailable status not detected 0x1 (ACTIVE): Transmit Buffer Unavailable status
1	RW	0x0	TPS Transmit Process Stopped This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Process Stopped status not detected 0x1 (ACTIVE): Transmit Process Stopped status detected
0	RW	0x0	TI Transmit Interrupt This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0x0 (INACTIVE): Transmit Interrupt status not detected 0x1 (ACTIVE): Transmit Interrupt status detected

GMAC_DMA_CH1_MISS_FRAME_CNT

Address: **Operational Base** + offset (0x11E4)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RO	0x0	MFC0 Overflow status of the MFC Counter When this bit is set then the MFC counter does not get incremented further. The bit gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0x0 (INACTIVE): Miss Frame Counter overflow not occurred 0x1 (ACTIVE): Miss Frame Counter overflow occurred
14:11	RO	0x0	reserved
10:0	RO	0x000	MFC Dropped Packet Counters This counter indicates the number of packet counters that are dropped by the DMA either because of bus error or because of programing RPF field in DMA_CH${i}_Rx_Control register. The counter gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event.

GMAC_DMA_CH1_RX_ERI_CNT

Address: **Operational Base** + offset (0x11E8)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RO	0x0	ECNT ERI Counter When ERIC bit of DMA_CH(#i)_RX_Control register is set, this counter increments for burst transfer completed by the Rx DMA from the start of packet transfer. This counter will get reset at the start of new packet.

8.5 Interface Description

There are two GMAC Controllers in RK3576, and each has two sets of IO interface, as shown below:

Table 8-3 GMAC0 Interface

Module Pin	Direction	Pad Name	IOMUX Setting

8.6 Application Note

8.6.1 Descriptors

The DMA engine uses descriptors to efficiently move data from source to destination with minimal application CPU intervention. The DMA is designed for packet-oriented data transfers such as packets in Ethernet. The DMA controller can be programmed to interrupt the application CPU for situations such as Packet Transmit and Receive Transfer completion, and other normal or error conditions.

The DMA and the application communicate through the following two data structures:

- Control and Status registers (CSR)
- Descriptor lists and data buffers

The base address of each list is written to the respective Tx Descriptor List Address register and Rx Descriptor List Address register. The descriptor list is forward linked and the next descriptor is always considered at a fixed offset to the current one. The offset is controlled by the DSL field of DMA_Ch[n]_Control register. The number of descriptors in the list is programmed in the respective Tx (or Rx) Descriptor Ring Length register. Once the DMA processes the last descriptor in the list, it automatically jumps back to the descriptor in the List Address register to create a descriptor ring.

The descriptor lists reside in the physical memory address space of the application. Each descriptor can point to a maximum of two buffers in the system memory. This enables two buffers to be used, physically addressed, rather than contiguous buffers in memory.

A data buffer resides in the application physical memory space and consists of an entire packet or part of a packet but cannot exceed a single packet. Buffers contain only data. Buffer status is maintained in the descriptor. Data chaining refers to packets that span multiple data buffers. However, a single descriptor cannot span multiple packets. The DMA skips to the data buffer of next packet when EOP is detected.

The GMAC supports the following two types of descriptors:

- Normal Descriptor: Normal descriptors are used for packet data and to provide control information applicable to the packets to be transmitted
- Context Descriptor: Context descriptors are used to provide control information applicable to the packet to be transmitted

The GMAC supports the ring structure for the DMA descriptor.

Copyright © 2024 Rockchip Electronics Co., Ltd.

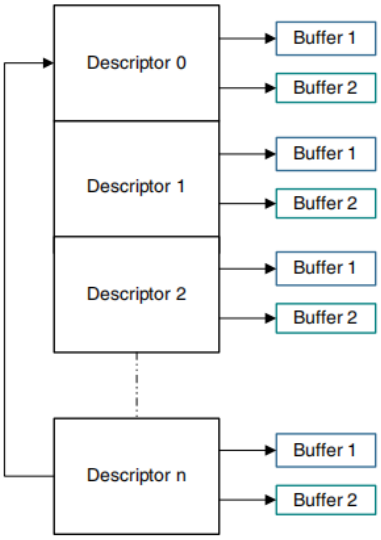

Fig. 8-10 Descriptor Ring Structure

In Ring structure, descriptors are separated by the Word, DWord, or LWord number programmed in the DSL field of the DMA_CH#_Control register. The application needs to program the total ring length, that is, the total number of descriptors in ring span in the following registers of a DMA channel:

- Transmit Descriptor Ring Length Register (DMA_CH#_TxDesc_Ring_Length)
- Receive Descriptor Ring Length Register (DMA_CH#_RxDesc_Ring_Length)

The Descriptor Tail Pointer Register contains the pointer to the descriptor address (N). The base address and the current descriptor pointer decide the address of the current descriptor that the DMA can process.

The descriptors up to one location less than the one indicated by the descriptor tail pointer (N – 1) are owned by the DMA. The DMA continues to process the descriptors until the following condition occurs:

Current Descriptor Pointer == Descriptor Tail Pointer

The DMA goes into the Suspend mode when this condition occurs. The application must perform a write to the Descriptor Tail pointer register and update the tail pointer so that the following condition is true:

Current Descriptor Pointer < Descriptor Tail Pointer

The DMA automatically wraps around the base address when the end of ring is reached. For descriptors owned by the application, the OWN bit of DES3 is reset to 0. For descriptors owned by the DMA, the OWN bit is set to 1. If the application has only one descriptor in the beginning, the application sets the last descriptor address (tail pointer) to Descriptor Base Address + 1. The DMA processes the first descriptor and then waits for the application to advance the tail pointer.

8.6.2 Transmit Descriptors

The DMA in GMAC requires at least one descriptor for a transmit packet. In addition to two buffers, two byte-count buffers, and two address pointers, the transmit descriptor has control fields which can be used to control the MAC operation on per-transmit packet basis. The Transmit Normal descriptor has two formats: Read format and Write-Back format.

8.6.3 Transmit Normal Descriptor (Read Format)

Table 8-5 TDES0 Normal Descriptor (Read Format)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Name	Description
31:0	BUF1AP	Buffer 1 Address Pointer or TSO Header Address Pointer These bits indicate the physical address of Buffer 1. These bits indicate the TSO Header Address pointer when the following bits are set: ■ TSE bit of TDES3 ■ FD bit of TDES3

Table 8-6 TDES1 Normal Descriptor (Read Format)

Bit	Name	Description
31:0	BUF2AP	Buffer 2 or Buffer 1 Address Pointer This bit indicates the physical address of Buffer 2 when a descriptor ring structure is used. There is no limitation for the buffer address alignment. In 40- or 48-bit addressing mode, these bits indicate the most-significant 8- or 16- bits of the Buffer 1 Address Pointer.

Table 8-7 TDES2 Normal Descriptor (Read Format)

Bit	Name	Description
31	IOC	Interrupt on Completion This bit controls the setting of TI and ETI status bits in the DMA_CH#_Status register. When ETIC = 1 and TDES2[LD] = 0, this bit sets the ETI bit. When TDES3[LD] = 1, this bit sets the TI status bit.
30	TTSE/TMWD	Transmit Timestamp Enable or External TSO Memory Write Enable This bit enables the IEEE1588 time stamping for Transmit packet referenced by the descriptor, if TSE bit is not set. If TSE bit is set and external TSO memory is enabled, setting this bit disables external TSO memory writing for this packet.
29:16	B2L	Buffer 2 Length The driver sets this field. When set, this field indicates Buffer 2 length
15:14	VTIR	VLAN Tag Insertion or Replacement These bits request the MAC to perform VLAN tagging or untagging before transmitting the packets. The application must set the CRC Pad Control bits appropriately when VLAN Tag Insertion, Replacement, or Deletion is enabled for the packet. The following list describes the values of these bits: ■ 2'b00: Do not add a VLAN tag. ■ 2'b01: Remove the VLAN tag from the packets before transmission. This option should be used only with the VLAN packets. ■ 2'b10: Insert a VLAN tag with the tag value programmed in the MAC_VLAN_Incl register or context descriptor. ■ 2'b11: Replace the VLAN tag in packets with the tag value programmed in the MAC_VLAN_Incl register or context descriptor. This option should be used only with the VLAN packets. These bits are valid when the Enable SA and VLAN Insertion on Tx option is selected while configuring

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Name	Description
		the core
13:0	HL or B1L	Header Length or Buffer 1 Length For Header length only bits [9:0] are taken. The size 13:0 is applicable only when interpreting buffer 1 length. If the TCP Segmentation Offload feature is enabled through the TSE bit of TDES3, this field is equal to the header length. When the TSE bit is set in TDES3, the header length includes the length in bytes from Ethernet Source address till the end of the TCP header. The maximum header length supported for TSO feature is 1023 bytes. The maximum header length supported for TSO feature is 1023 bytes. If the TCP Segmentation Offload feature is not enabled, this field is equal to Buffer 1 length.

Table 8-8 TDES3 Normal Descriptor (Read Format)

Bit	Name	Description
31	OWN	Own Bit When this bit is set, it indicates that the DMA owns the descriptor. When this bit is reset, it indicates that the application owns the descriptor. The DMA clears this bit after it completes the transfer of data given in the associated buffer(s).
30	CTXT	Context Type This bit should be set to 1'b0 for normal descriptor.
29	FD	First Descriptor When this bit is set, it indicates that the buffer contains the first segment of a packet.
28	LD	Last Descriptor When this bit is set, it indicates that the buffer contains the last segment of the packet. When this bit is set, the B1L or B2L field should have a non-zero value.
27:26	CPC	CRC Pad Control This field controls the CRC and Pad Insertion for Tx packet. This field is valid only when the first descriptor bit (TDES3[29]) is set. The following list describes the values of Bits[27:26]: ■ 2'b00: CRC and Pad Insertion. The MAC appends the cyclic redundancy check (CRC) at the end of the transmitted packet of length greater than or equal to 60 bytes. The MAC automatically appends padding and CRC to a packet with length less than 60 bytes. ■ 2'b01: CRC Insertion (Disable Pad Insertion). The MAC appends the CRC at the end of the transmitted packet but it does not append padding. The application should ensure that the padding bytes are present in the packet being transferred from the Transmit Buffer, that is, the packet being transferred from the Transmit Buffer is of length greater than or equal to 60 bytes. ■ 2'b10: Disable CRC Insertion. The MAC does not append the CRC at the end of the transmitted packet. The application should ensure that the padding and CRC bytes are present in the packet being transferred from the Transmit Buffer.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Name	Description
		■ 2'b11: CRC Replacement. The MAC replaces the last four bytes of the transmitted packet with recalculated CRC bytes. The application should ensure that the padding and CRC bytes are present in the packet being transferred from the Transmit Buffer. This field is valid only for the first descriptor. Note: When the TSE bit is set, the MAC ignores this field because the CRC and pad insertion is always done for segmentation.
25:23	SAIC	SA Insertion Control These bits request the MAC to add or replace the Source Address field in the Ethernet packet with the value given in the MAC Address 0 register. The application must set the CRC Pad Control bits appropriately when SA Insertion Control is enabled for the packet. Bit 25 specifies the MAC Address Register (1 or 0) value that is used for Source Address insertion or replacement. The following list describes the values of Bits[24:23]: ■ 2'b00: Do not include the source address ■ 2'b01: Include or insert the source address. For reliable transmission, the application must provide frames without source addresses. ■ 2'b10: Replace the source address. For reliable transmission, the application must provide frames with source addresses. ■ 2'b11: Reserved These bits are valid in the EQOS-DMA, EQOS-AXI, and EQOS-AHB configurations when the Enable SA and VLAN Insertion on Tx option is selected while configuring the core and when the First Segment control bit (TDES3 [29]) is set. This field is valid only for the first descriptor.
22:19	SLOTNUM or THL	SLOTNUM: Slot Number Control Bits in AV Mode These bits indicate the slot interval in which the data should be fetched from the corresponding buffers addressed by TDES0 or TDES1. When the Transmit descriptor is fetched, the DMA compares the slot number value in this field with the slot interval maintained in the RSN field DMA_CH#_Slot_Function_Control_Status. It fetches the data from the buffers only if a value matches. These bits are valid only for the AV channels. THL: TCP/UDP Header Length If the TSE bit is set, this field contains the length of the TCP/UDP header. The minimum value of this field must be 5 for TCP header. The value must be equal to 2 for UDP header. This field is valid only for the first descriptor.
18	TSE	TCP Segmentation Enable When this bit is set, the DMA performs the TCP/UDP segmentation or UDP fragmentation for a packet depending on the TSE_MODE[1:0] bit of the DMA_CH(#i)_Tx_Control Register. This bit is valid only if the FD bit is set.
17:16	CIC/TPL	Checksum Insertion Control or TCP Payload Length

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Name	Description
		These bits control the checksum calculation and insertion. The following list describes the bit encoding: ■ 2'b00: Checksum Insertion Disabled. ■ 2'b01: Only IP header checksum calculation and insertion are enabled. ■ 2'b10: IP header checksum and payload checksum calculation and insertion are enabled, but pseudo-header checksum is not calculated in hardware. ■ 2'b11: IP Header checksum and payload checksum calculation and insertion are enabled, and pseudo-header checksum is calculated in hardware. This field is valid when the Enable Transmit TCP/IP Checksum Offload option is selected and the TSE bit is reset. When the TSE bit is set, this field contains the upper bits [17:16] of the TCP Payload (or IP Payload for UDP fragmentation). This allows the TCP/UDP packet length field to be spanned across TDES3[17:0] to provide 256 KB packet length support. This field is valid only for the first descriptor.
15	TPL	Reserved or TCP Payload Length When the TSE bit is reset, this bit is reserved. When the TSE bit is set, this is Bit 15 of the TCP payload length [17:0]. This field is valid only when the Enable TCP Segmentation Offloading for TCP/IP Packets option is selected while configuring the core.
14:0	FL/TPL	Frame Length or TCP Payload Length This field is equal to the length of the packet to be transmitted in bytes. When the TSE bit is not set, this field is equal to the total length of the packet to be transmitted: Ethernet Header Length + TCP /IP Header Length – Preamble Length – SFD Length + Ethernet Payload Length When the TSE bit is set, this field is equal to the lower 15 bits of the TCP payload length in case of segmentation and IP payload in case of UDP fragmentation. In case of segmentation, this length does not include Ethernet header or TCP/UDP/IP header length. In case of fragmentation, this length does not include Ethernet header and IP header. When DWRR/WFQ algorithm is NOT enabled, value written into this field is not used when TSE = 0.

8.6.4 Transmit Normal Descriptor (Write-back Format)

The write-back format of the Transmit Descriptor includes timestamp low, timestamp high, OWN, and Status bits. The write-back format is applicable only for the last descriptor of the corresponding packet. The LD bit (TDES3[28]) is set in the descriptor where the DMA writes back the status and timestamp information for the corresponding Transmit packet. this format is only applicable to the last descriptor of a packet.

Table 8-9 TDES0 Normal Descriptor (Write-Back Format)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Name	Description
31:0	TTSL	Transmit Packet Timestamp Low The DMA updates this field with least significant 32 bits of the timestamp captured for the corresponding Transmit packet. The DMA writes the timestamp only if TTSE bit of TDES2 is set in the first descriptor of the packet. This field has the timestamp only if the Last Segment bit (LS) in the descriptor is set and the Timestamp status (TTSS) bit is set

Table 8-10 TDES1 Normal Descriptor (Write-Back Format)

Bit	Name	Description
31:0	TTSH	Transmit Packet Timestamp High The DMA updates this field with the most significant 32 bits of the timestamp captured for corresponding transmit packet. The DMA writes the timestamp only if the TTSE bit of TDES2 is set in the first descriptor of the packet. This field has the timestamp only if the Last Segment bit (LS) in the descriptor is set and Timestamp status (TTSS) bit is set.

Table 8-11 TDES2 Normal Descriptor (Write-Back Format)

Bit	Name	Description
31:0	Reserved	Reserved

Table 8-12 TDES2 Normal Descriptor (Write-Back Format)

Bit	Name	Description
31	OWN	Own Bit When this bit is set, it indicates that the DMA owns the descriptor. When this bit is reset, it indicates that the application owns the descriptor. The DMA clears this bit after it completes the transfer of data given in the associated buffer(s).
30	CTXT	Context Type This bit should be set to 1'b0 for normal descriptor.
29	FD	First Descriptor When this bit is set, it indicates that the buffer contains the first segment of a packet.
28	LD	Last Descriptor When this bit is set, it indicates that the buffer contains the last segment of the packet. When this bit is set, the B1L or B2L field should have a non-zero value.
27:24	Reserved	Reserved
23	DE	Descriptor Error When this bit is set, it indicates that the descriptor content is incorrect. The DMA sets this bit during write-back while closing the descriptor. Descriptor Errors can be: ■ Incorrect sequence from the context descriptor. For example, a location after the first descriptor for a packet ■ All 1s ■ CTXT, LD, and FD bits set to 1 Note 1: When Descriptor Error occurs due to All 1s or CTXT, LD, and FD bits set to 1, the Transmit DMA closes the transmit descriptor with DE and LD bits set to 1. When IOC bit in TDES2 of corresponding first

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Name	Description
		descriptor is set to 1, Transmit DMA will set the TI bit in the DMA_CH#_Status register. Note 2: Based on CTXT, LD, and FD bits of the transmit descriptor, the subsequent descriptor might be considered as the First Descriptor (even if FD bit is not set) and partial packet is sent.
22:18	Reserved	Reserved
17	TTSS	Tx Timestamp Status This status bit indicates that a timestamp has been captured for the corresponding transmit packet. When this bit is set, TDES0 and TDES1 have timestamp values that were captured for the Transmit packet. This field is valid only when the Last Segment control bit (TDES3 [28]) in a descriptor is set. This bit is valid only when IEEE1588 timestamping feature is enabled; otherwise, it is reserved.
16	EUE	ECC Uncorrectable Error Status Indicates the ECC uncorrectable error in the TSO memory. Note: Uncorrectable error in Transmit FIFO memory is reported with (Bit 13) FF = 1. This is because, all such packets are flushed by GMAC.
15	ES	Error Summary This bit indicates the logical OR of the following bits: ■ TDES3[0]: IP Header Error ■ TDES3[14]: Jabber Timeout ■ TDES3[13]: Packet Flush ■ TDES3[12]: Payload Checksum Error ■ TDES3[11]: Loss of Carrier ■ TDES3[10]: No Carrier ■ TDES3[9]: Late Collision ■ TDES3[8]: Excessive Collision ■ TDES3[3]: Excessive Deferral ■ TDES3[2]: Underflow Error This bit is also set when EUE (bit 16) is set
14	JT	Jabber Timeout This bit indicates that the MAC transmitter has experienced a jabber time-out. This bit is set only when the JD bit of the MAC_Configuration register is not set.
13	PF	Packet Flushed This bit indicates that the DMA or MTL flushed the packet because of a software flush command given by the CPU.
12	PCE	Payload Checksum Error This bit indicates that the Checksum Offload engine had a failure and did not insert any checksum into the encapsulated TCP, UDP, or ICMP payload. This failure can be either because of insufficient bytes, as indicated by the Payload Length field of the IP Header or the MTL starting to forward the packet to the MAC transmitter in Store-and-Forward mode without the checksum having been calculated yet. This second error condition only occurs when the Transmit FIFO

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Name	Description
		depth is less than the length of the Ethernet packet being transmitted to avoid deadlock, the MTL starts forwarding the packet when the FIFO is full, even in the store-and-forward mode. This error can also occur when Bus Error is detected during packet transfer. When the Full Checksum Offload engine is not enabled, this bit is reserved.
11	LoC	Loss of Carrier This bit indicates that Loss of Carrier occurred during packet transmission (that is, the gmii_crs_i signal was inactive for one or more transmit clock periods during packet transmission). This is valid only for the packets transmitted without collision and when the MAC operates in the half-duplex mode.
10	NC	No Carrier This bit indicates that the carrier sense signal form the PHY was not asserted during transmission.
9	LC	Late Collision This bit indicates that packet transmission was aborted because a collision occurred after the collision window (64 byte times including Preamble in MII mode and 512 byte times including Preamble and Carrier Extension in GMII mode). This bit is not valid if Underflow Error is set.
8	EC	Excessive Collision This bit indicates that the transmission was aborted after 16 successive collisions while attempting to transmit the current packet. If the DR bit is set in the MAC_Configuration register, this bit is set after first collision and the transmission of the packet is aborted.
7:4	CC	Collision Count This 4-bit counter value indicates the number of collisions occurred before the packet was transmitted. The count is not valid when the EC bit is set.
3	ED	Excessive Deferral This bit indicates that the transmission ended because of excessive deferral of over 24,288 bit times (155,680 bits times in 1000 Mbps mode or Jumbo Packet enabled mode) if DC bit is set in the MAC_Configuration register. When TBS is enabled in full duplex mode and this bit is set, it indicates that the frame has been dropped after the expiry time has reached.
2	UF	Underflow Error This bit indicates that the MAC aborted the packet because the data arrived late from the system memory. The underflow error can occur because of either of the following conditions: ■ The DMA encountered an empty Transmit Buffer while transmitting the packet ■ The application filled the MTL Tx FIFO slower than the MAC transmit rate The transmission process enter the suspended state and sets the underflow bit corresponding to a queue in the MTL_Interrupt_Status register.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Name	Description
1	DB	Deferred Bit This bit indicates that the MAC deferred before transmitting because of presence of carrier. This bit is valid only in the half-duplex mode.
0	IHE	IP Header Error When IP Header Error is set, this bit indicates that the Checksum Offload engine detected an IP header error. This bit is valid only when Tx Checksum Offload is enabled. Otherwise, it is reserved. If COE detects an IP header error, it still inserts an IPv4 header checksum if the Ethernet Type field indicates an IPv4 payload. In full duplex mode, when EST/Qbv is enabled and this bit is set, it indicates the frame drop status due to Frame Size error or Schedule Error.

8.6.5 Programming Guide

8.6.5.1 Initializing DMA

Complete the following steps to initialize the DMA:
1. Provide a software reset. This resets all of the MAC internal registers and logic (bit-0 of DMA_Mode).
2. Wait for the completion of the reset process (poll bit 0 of the DMA_Mode, which is only cleared after the reset operation is completed).
3. Program the following fields to initialize the DMA_SysBus_Mode register:
a. AAL
b. Fixed burst or undefined burst
c. Burst mode values in case of AHB bus interface, OSR_LMT in case of AXI bus interface.
d. If fixed length value is enabled, select the maximum burst length possible on the AXI Bus (bits [7:1])
4. Create a descriptor list for transmit and receive. In addition, ensure that the descriptors are owned by DMA (set bit 31 of descriptor TDES3/RDES3). For more information about descriptors, see section "Descriptors".
5. Program the Transmit and Receive Ring length registers (DMA_CH(#i)_TxDesc_Ring_Length (for i = 0; i <= GMAC_NUM_DMA_TX_CH-1) and DMA_CH(#i)_RxDesc_Ring_Length (for i = 0; i <= GMAC_NUM_DMA_RX_CH-1)). The ring length programmed must be at least 4.
6. Initialize receive and transmit descriptor list address with the base address of the transmit and receive descriptor (DMA_CH(#i)_TxDesc_List_Address (for i = 0; i <= GMAC_NUM_DMA_TX_CH-1), DMA_CH(#i)_RxDesc_List_Address (for i = 0; i <= GMAC_NUM_DMA_RX_CH-1)). Also, program transmit and receive tail pointer registers indicating to the DMA about the available descriptors (DMA_CH(#i)_TxDesc_Tail_Pointer (for i = 0; i <= GMAC_NUM_DMA_TX_CH-1) and DMA_CH(#i)_RxDesc_Tail_Pointer (for i = 0; i <= GMAC_NUM_DMA_RX_CH-1)).
7. Program the settings of the following registers for the parameters like maximum burst-length (PBL) initiated by DMA, descriptor skip lengths, OSP in case of TxDMA, RBSZ in case of RxDMA, and so on:
- DMA_CH(#i)_Control (for i = 0; i <= GMAC_NUM_DMA_TX_CH-1)
- DMA_CH(#i)_TX_Control (for i = 0; i <= GMAC_NUM_DMA_TX_CH-1)
- DMA_CH(#i)_RX_Control (for i = 0; i <= GMAC_NUM_DMA_RX_CH-1)

8. Enable the interrupts by programming the DMA_CH(#i)_Interrupt_Enable (for i = 0; i <= GMAC_NUM_DMA_TX_CH-1) register.
9. Start the Receive and Transmit DMAs by setting SR (bit 0) of the DMA_CH(#i)_RX_Control (for i = 0; i <= GMAC_NUM_DMA_RX_CH-1) and ST (bit 0) of the DMA_CH(#i)_TX_Control (for i = 0; i <= GMAC_NUM_DMA_TX_CH-1) register.
10. Repeat steps 4 to 9 for all the Tx DMA and Rx DMA channels selected in the hardware.

Copyright © 2024 Rockchip Electronics Co., Ltd.

8.6.5.2 Initializing MTL Registers

The Transaction Layer (MTL) registers must be initialized to establish the transmit and receive operating modes and commands.
Complete the following steps to initialize the MTL registers:
1. Program the Tx Scheduling (SCHALG) and Receive Arbitration Algorithm (RAA) fields in MTL_Operation_Mode to initialize the MTL operation in case of multiple Tx and Rx queues.
2. Program the Receive Queue to DMA mapping in MTL_RxQ_DMA_Map0 and MTL_RxQ_DMA_Map1 registers.
3. Program the following fields to initialize the mode of operation in the MTL_TxQ0_Operation_Mode register.
a. Transmit Store And Forward (TSF) or Transmit Threshold Control (TTC) in case of threshold mode
b. Transmit Queue Enable (TXQEN) to value 2'b10 to enable Transmit Queue0
c. Transmit Queue Size (TQS)
4. Program the following fields to initialize the mode of operation in the MTL_RxQ0_Operation_Mode register:
a. Receive Store and Forward (RSF) or RTC in case of Threshold mode
b. Flow Control Activation and De-activation thresholds for MTL Receive FIFO (RFA and RFD)
c. Error Packet and undersized good Packet forwarding enable (FEP and FUP)
d. Receive Queue Size (RQS)
5. Repeat previous two steps for all MTL Tx and Rx queues selected in the configuration.

8.6.5.3 Initializing MAC

The MAC configuration registers establish the operating mode of the MAC. These registers must be initialized before initializing the DMA.
The following MAC Initialization operations can be performed after DMA initialization. If the MAC initialization is completed before the DMA is configured, enable the MAC receiver (last step in the following sequence) only after the DMA is active. Otherwise, received frames fill the Rx FIFO and overflow.
1. Provide the MAC address registers: MAC_Address0_High and MAC_Address0_Low. If more than one MAC address is enabled in your configuration, program the MAC addresses appropriately.
2. Program the following fields to set the appropriate filters for the incoming frames in the MAC_Packet_Filter register:
a. Receive All
b. Promiscuous mode
c. Hash or Perfect Filter
d. Unicast, multicast, broadcast, and control frames filter settings
3. Program the following fields for proper flow control in the MAC_Q0_Tx_Flow_Ctrl register:
a. Pause time and other Pause frame control bits
b. Transmit Flow control bits
c. Flow Control Busy
4. Program the MAC_Interrupt_Enable register, as required, and if applicable, for your configuration.
5. Program the appropriate fields in the MAC_Configuration register. For ex: Inter-packet gap while transmission and jabber disable.
6. Set bit 0 and 1 in MAC_Configuration registers to start the MAC transmitter and receiver.

8.6.5.4 Performing Normal Receive and Transmit Operation

During normal operation of the GMAC, normal and transmit interrupts are read, descriptors polled, the DMA is suspended (if it does not own descriptors), and values of current host transmitter or receiver descriptor pointers are read for debugging.
For normal operation, complete the following steps:

Copyright © 2024 Rockchip Electronics Co., Ltd.

1. For normal transmit and receive interrupts, read the interrupt status. Then, poll the descriptors, reading the status of the descriptor owned by the Host (either transmit or receive).
2. Set appropriate values for the descriptors, ensuring that transmit and receive descriptors are owned by the DMA to resume the transmission and reception of data.
3. If the descriptors are not owned by the DMA (or no descriptor is available), the DMA goes into SUSPEND state. The transmission or reception can be resumed by freeing the descriptors and writing the descriptor tail pointer to Tx/Rx tail pointer register (DMA_CH[n]_TxDesc_Tail_Pointer and DMA_CH[n]_RxDesc_Tail_Pointer).
4. The values of the current host transmitter or receiver descriptor address pointer can be read for the debug process (DMA_CH[n]_Current_App_TxDesc and DMA_CH[n]_Current_App_RxDesc).
5. The values of the current host transmit buffer address pointer and receive buffer address pointer can be read for the debug process (Register DMA_CH[n]_Current_App_TxBuffer and DMA_CH[n]_Current_App_RxBuffer)

8.6.5.5 Stopping and Starting Transmission

Complete the following steps to pause the transmission for some time.
1. Disable the Transmit DMA (if applicable) by clearing Bit 0 (ST) of DMA_CH(#i)_TX_Control (for i = 0; i <= GMAC_NUM_DMA_TX_CH-1) Register.
2. Wait for any previous frame transmissions to complete. You can check this by reading the appropriate bits of MTL_TxQ0_Debug Register (TRCSTS is not 01 and TXQSTS=0).
3. Disable the MAC transmitter and MAC receiver by clearing Bit (RE) and Bit 1(TE) of the MAC_Configuration Register.
4. Disable the Receive DMA (if applicable), after making sure that the data in the Rx FIFO is transferred to the system memory (by reading the appropriate bits of MTL_TxQ0_Debug Register, PRXQ=0 and RXQSTS=00).
5. Make sure that both Tx Queue and Rx Queue are empty (TXQSTS is 0 in MTL_TxQ0_Debug Register and RXQSTS is 0 in MTL_RxQ0_Debug Register).
6. To restart the operation, first start the DMAs, and then enable the MAC Transmitter and Receiver.

8.6.5.6 Initialization Guidelines for System Time Generation

You can enable the timestamp feature by setting Bit 0 of the MAC_Timestamp_Control Register. However, it is essential that the timestamp counter be initialized after this bit is set. Complete the following steps during GMAC initialization:
1. Mask the Timestamp Trigger interrupt by clearing the bit 16 of MAC_Interrupt_Enable Register.
2. Set Bit 0 of MAC_Timestamp_Control Register to enable timestamping.
3. Program MAC_Sub_Second_Increment Register based on the PTP clock frequency.
4. If you are using the Fine Correction approach, program MAC_Timestamp_Addend and set Bit 5 of MAC_Timestamp_Control Register.
5. Poll the MAC_Timestamp_Control Register until Bit 5 is cleared.
6. Program Bit 1 of MAC_Timestamp_Control Register to select the Fine Update method (if required).
7. Program MAC_System_Time_Seconds_Update Register and MAC_System_Time_Nanoseconds_Update Register with the appropriate time value.
8. Set Bit 2 in MAC_Timestamp_Control Register.
The timestamp counter starts operation as soon as it is initialized with the value written in the Timestamp Update registers. If one-step timestamping is enabled
a. To enable one-step timestamping, program Bit 27 of the TDES3 Context Descriptor.
b. Program registers MAC_Timestamp_Ingress_Asym_Corr and MAC_Timestamp_Egress_Asym_Corr to update the correction field in PDelay_Req PTP messages.
9. Enable the MAC receiver and transmitter for proper timestamping.

Copyright © 2024 Rockchip Electronics Co., Ltd.

8.6.5.7 Coarse Correction Method

To synchronize or update the system time in one process (coarse correction method), complete the following steps:
1. Set the offset (positive or negative) in the Timestamp Update registers (MAC_System_Time_Seconds_Update and MAC_System_Time_Nanoseconds_Update).
2. Set Bit 3 (TSUPDT) of MAC_Timestamp_Control Register. The value in the Timestamp Update registers is added to or subtracted from the system time when the TSUPDT bit is cleared.

8.6.5.8 Programming Guidelines for TSO

The TCP Segmentation Offload (TSO) engine is used to offload the TCP segmentation functions to the hardware. To program the TSO, set the TSE bit to enable TCP packet segmentation, and program descriptor fields to enable TSO for the current packet. Complete the following steps to program TSO:
1. Program the TSE bit of corresponding DMA_CH[n]_Tx_Control register to enable TCP packet segmentation in that DMA.
2. In addition to the normal transfer descriptor setting, the following descriptor fields must be programmed to enable TSO for the current packet:
a. Enable TSE in Bit 18 of TDES3
b. Program the length of the un-segmented TCP/IP packet payload in bits [17:0] of TDES3 and the TCP header in bits [22:19] of TDES3.
c. Program the maximum size of the segment in MSS of DMA_CH[n]_Control register or MSS in the context descriptor. If MSS field is programmed in both DMA_CH[n]_Control register and in the context descriptor, the latest software programmed sequence is considered.
3. The header of the unsegmented TCP/IP packet should be in Buffer 1 of the first descriptor and this buffer must not hold any payload bytes. The payload is allocated to Buffer 2 and the buffers of the subsequent descriptors.

8.6.5.9 Programming Guidelines for Multi-Channel Multi-Queuing

Transmit

1. Program the Transmit queue size in the TQS field of MTL_TxQ[n]_Operation_Mode register. Based on the value programmed in the TQS field, the size of the queue is determined.
In the Transmit operation, the number of channels is equal to the number of the queues. Due to this reason, the Channel-to-Queue mapping is fixed.
2. For a queue to be used, the queue needs to be enabled in TXQEN in the corresponding MTL_TxQ[n]_Operation_Mode Register. In DMA configurations, the ST bit of DMA_CH[n]_Tx_Control Register and corresponding TXQEN in MTL_TxQ[n]_Operation Mode Register needs to be enabled.
3. The scheduling method needs to be programmed in SCHALG of MTL_Operation_Mode register.
4. Program the MTL_TxQ[n]_Quantum_Weight for DCB queue as per the selected algorithm. In case of CBS algorithm in AVB queues, the MTL_TxQ[n]_ETS_Control, MTL_TxQ[n]_SendSlopeCredit, MTL_TxQ[n]_HiCredit and MTL_TxQ[n]_LoCredit registers also need to be programmed as required.
5. If DCB is enabled and PFC function is required, program MAC_TxQ_Prty_Map0 Register to assign a fixed priority to the queue. This priority assigned is used for determining if the corresponding queue should stop transmitting packet based on the received PFC packet.

Receive

1. Program the Receive queue size in the RQS field of MTL_RxQ[n]_Operation_Mode Register. Based on the value programmed in RQS field, the size of the queue is determined.
2. Enable the Receive Queues 0 to 7 in the fields RXQ0EN to RXQ7EN in MAC_RxQ_Ctrl0 Register for AV or DCB. In DMA configurations, SR bit of statically or dynamically mapped DMA_CH[n]_Rx_Control Register and corresponding RXQ[n]_EN in MAC_RxQ_Ctrl0 Register needs to be enabled.

Copyright © 2024 Rockchip Electronics Co., Ltd.

3. The MAC routes the Rx packets to the Rx Queues based on following packet types:
   a. AV PTP Packets: Based on the programming of AVPTPQ in MAC_RxQ_Ctrl1 Register.
   b. AV Untagged Control packets: Based on the programming of AVCPQ in MAC_RxQ_Ctrl1 Register.
   c. Data Center Bridging (DCB) related Link Layer Discovery Protocol (LLDP) packets. Program
   DCBCPQ in MAC_RxQ_Ctrl1 Register to indicate to MAC which queue should get the DCB packets.
   d. VLAN Tag Priority field in VLAN Tagged packets: Program PSRQ7-0 of the MAC_RxQ_Ctrl2 and MAC_RxQ_Ctrl3 Register for the routing of tagged packets based on the USP (user Priority) field of the received packets to the Rx Queues 0 to 7.
   e. The AV tagged control and data packets are also routed based on PSRQ field of the MAC_RxQ_Ctrl2 and MAC_RxQ_Ctrl3 registers.
4. If multiple RX DMA channels are enabled, the following programming should be done for proper arbitration and mapping:
   a. Program the RAA field of MTL_Operation_Mode register to select the arbitration algorithm to decide which RxQ is read out from the RxFIFO memory.
   b. Program the MTL_RxQ[n]_Control to decide the weights and the packet arbitration for each RxQ.
   c. If static mapping is programmed in MTL_RxQ_DMA_Map[n] register (RXQ[n]DADMACH is reset to 0), bits RXQx2DMA and others need to be programmed to select the channel for which each queue is mapped.
   d. Set RXQ[n]DADMACH bit in MTL_RxQ_DMA_Map0 Register to select dynamic mapping of
   packets in each RxQueue.
   e. In dynamic channel mapping, the routing of a packet to a specific RxDMA channel is decided by the value of DCS field in the lowest MAC Address Register.

8.6.6 Transmit Context Descriptor

The context descriptor is used to provide the timestamps for one-step timestamp correction, VLAN Tag ID for VLAN insertion feature. The Transmit Context descriptor can be provided any time before a packet descriptor. The context is valid for the current packet and subsequent packets. The context descriptor is used to provide the timestamps for one-step timestamp correction and VLAN Tag ID for VLAN insertion feature. Write back is done on a context descriptor only to reset the OWN bit.

Table 8-13 TDES0 Context Descriptor

Bit	Name	Description
31:0	TTSL	Transmit Packet Timestamp Low For one-step correction, the driver can provide the lower 32 bits of timestamp in this descriptor word. The DMA uses this value as the low word for doing one-step timestamp correction. This field is valid only if the OSTC and TCMSSV bits of TDES3 context descriptor are set.

Table 8-14 TDES1 Context Descriptor

Bit	Name	Description
31:0	TTSH	Transmit Packet Timestamp High For one-step correction, the driver can provide the upper 32 bits of timestamp in this descriptor. The DMA uses this value as the high word for doing one-step timestamp correction. This field is valid only if the OSTC and TCMSSV bits of TDES3 context descriptor are set.

Table 8-15 TDES2 Context Descriptor

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Name	Description
31:16	IVT	Inner VLAN Tag When the IVLTV bit of TDES3 context descriptor is set and the TCMSSV and OSTC bits of TDES3 context descriptor are reset, TDES2[31:16] contains the inner VLAN Tag to be inserted in the subsequent Transmit packets.
15:14	Reserved	Reserved
13:0	MSS	Maximum Segment Size When the Enable TCP Segmentation Offloading for TCP/IP Packets option is selected, the driver can provide maximum segment size in this field. This segment size is used while segmenting the TCP/IP payload. This field is valid only if the TCMSSV bit of TDES3 context descriptor is set and the OSTC bit of the TDES3 context descriptor is reset.

Table 8-16 TDES3 Context Descriptor

Bit	Name	Description
31	OWN	Own Bit When this bit is set, it indicates that the GMAC DMA owns the descriptor. When this bit is reset, it indicates that the application owns the descriptor. The DMA clears this bit immediately after the read.
30	CTXT	Context Type This bit should be set to 1'b1 for Context descriptor.
29:28	Reserved	Reserved
27	OSTC	One-Step Timestamp Correction Enable When this bit is set, the DMA performs a one-step timestamp correction with reference to the timestamp values provided in TDES0 and TDES1.
26	TCMSSV	One-Step Timestamp Correction Input or MSS Valid When this bit and the OSTC bit are set, it indicates that the Timestamp Correction input provided in TDES0 and TDES1 is valid. When the OSTC bit is reset and this bit and the TSE bit of TDES3 are set in subsequent normal descriptor, it indicates that the MSS input in TDES2 is valid.
25:24	Reserved	Reserved
23	DE	Descriptor Error When this bit is set, it indicates that the descriptor content is incorrect.The DMA sets this bit during write-back while closing the context descriptor. Descriptor Errors can be: ■ Incorrect sequence from the context descriptor. For example, a location before the first descriptor for a packet ■ All 1s ■ CD, LD, and FD bits set to 1 Note 1: When Descriptor Error occurs due to All 1s or CTXT, LD, and FD bits set to 1, the Transmit DMA closes the transmit descriptor with DE and LD bits set to 1. When IOC bit in TDES2 of corresponding first descriptor is set to 1, Transmit DMA will set the TI bit in the DMA_CH#_Status Register. Note 2: Based on CTXT, LD, and FD bits of the transmit descriptor, the subsequent descriptor might

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Name	Description
		be considered as the First Descriptor (even if FD bit is not set) and partial packet is sent.
22:20	Reserved	Reserved
19:18	IVTIR	Inner VLAN Tag Insert or Replace When this bit is set, these bits request the MAC to perform Inner VLAN tagging or un-tagging before transmitting the packets. If the packet is modified for VLAN tags, the MAC automatically recalculates and replaces the CRC bytes. The following list describes the values of these bits: ■ 2'b00: Do not add the inner VLAN tag. ■ 2'b01: Remove the inner VLAN tag from the packets before transmission. This option should be used only with the VLAN frames. ■ 2'b10: Insert an inner VLAN tag with the tag value programmed in the MAC_Inner_VLAN_Incl register or context descriptor. ■ 2'b11: Replace the inner VLAN tag in packets with the tag value programmed in the MAC_Inner_VLAN_Incl register or context descriptor. This option should be used only with the VLAN frames. These bits are valid when the Enable SA and VLAN Insertion on Tx and Enable Double VLAN Processing options are selected.
17	IVLTV	Inner VLAN Tag Valid When this bit is set, it indicates that the IVT field of TDES2 is valid.
16	VLTV	VLAN Tag Valid When this bit is set, it indicates that the VT field of TDES3 is valid.
15:0	VT	VLAN Tag This field contains the VLAN Tag to be inserted or replaced in the packet. This field is used as VLAN Tag only when the VLTI bit of the MAC_VLAN_Incl register is reset.

8.6.7 Receive Descriptors

The DMA in GMAC attempts to read a descriptor only if the Tail Pointer is different from the Base Pointer or current pointer. It is recommended to have a descriptor ring with a length that can accommodate at least two complete packets received by the MAC. Otherwise, the performance of the DMA is impacted greatly because of the unavailability of the descriptors. In such situations, the RxFIFO in MTL becomes full and starts dropping packets.

The following Receive Descriptors are present:

- Normal descriptors
- Context descriptors

All RX descriptors are prepared by the software and given to the DMA as "Normal" Descriptors with the content as shown in Receive Normal Descriptor (Read Format). The DMA reads this descriptor and after transferring a received packet (or part of) to the buffers indicated by the descriptor, the Rx DMA will close the descriptor with the corresponding packet status. The format of this status is given in the "Receive Normal Descriptor (Write-Back Format)". For some packets, the normal descriptor bits are not enough to write the complete status. For such packets, the RX DMA writes the extended status to the next descriptor (without processing or using the Buffers/ Pointers embedded in that descriptor). The format and content of the descriptor write back is described in "Receive Context Descriptor".

Copyright © 2024 Rockchip Electronics Co., Ltd.

8.6.8 Receive Normal Descriptors(Read Format)

Table 8-17 TDES0 Normal Descriptor(Read Format)

Bit	Name	Description
31:0	BUF1AP	Header or Buffer 1 Address Pointer When the SPH bit of Control register of a channel is reset, these bits indicate the physical address of Buffer 1. When the SPH bit is set, these bits indicate the physical address of Header Buffer where the Rx DMA writes the L2/L3/L4 header bytes of the received packet. The application can program a byte-aligned address for this buffer which means that the LS bits of this field can be non-zero. However, while transferring the start of packet, the DMA performs a Write operation with RDES0[1:0] (or RDES0[2:0]/[3:0] in case of 64-/128-bit configuration) as zero. However, the packet data is shifted as per actual offset as given by buffer address pointer. If the address pointer points to a buffer where the middle or last part of the packet is stored, the DMA ignores the offset address and writes to the full location as indicated by the data-width.

Table 8-18 TDES1 Normal Descriptor(Read Format)

Bit	Name	Description
31:0	Reserved or BUF1AP	In 64-bit addressing mode, this field contains the most-significant 32 bits of the Buffer 1 Address Pointer. Otherwise, this field is reserved.

Table 8-19 TDES2 Normal Descriptor(Read Format)

Bit	Name	Description
31:0	Reserved or BUF1AP	In 64-bit addressing mode, this field contains the most-significant 32 bits of the Buffer 1 Address Pointer. Otherwise, this field is reserved.

Table 8-20 TDES3 Normal Descriptor(Read Format)

Bit	Name	Description
31	OWN	Own Bit When this bit is set, it indicates that the GMAC DMA owns the descriptor. When this bit is reset, it indicates that the application owns the descriptor. The DMA clears this bit when either of the following conditions is true: ■ The DMA completes the packet reception ■ The buffers associated with the descriptor are full
30	IOC	Interrupt Enabled on Completion When this bit is set, an interrupt is issued to the application when the DMA closes this descriptor.
29:26	Reserved	Reserved
25	BUF2V	Buffer 2 Address Valid When this bit is set, it indicates to the DMA that the buffer 2 address specified in RDES2 is valid. The application must set this bit so that the DMA can use the address, to which the Buffer 2 address in RDES2 is pointing, to write received packet data.
24	BUF1V	Buffer 1 Address Valid

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Name	Description
		When set, this indicates to the DMA that the buffer 1 address specified in RDES1 is valid. The application must set this value if the address pointed to by Buffer 1 address in RDES1 can be used by the DMA to write received packet data.
23:0	Reserved	Reserved

8.6.9 Receive Normal Descriptors(Write-Back Format)

Table 8-21 TDES0 Normal Descriptor(Write-Back Format)

Bit	Name	Description
31:16	IVT	Inner VLAN Tag This field contains the Inner VLAN tag of the received packet if the RS0V bit of RDES3 is set. This is valid only when Double VLAN tag processing and VLAN tag stripping are enabled.
15:0	OVT	Outer VLAN Tag This field contains the Outer VLAN tag of the received packet if the RS0V bit of RDES3 is set.

Table 8-22 TDES1 Normal Descriptor(Write-Back Format)

Bit	Name	Description
31:16	OPC	OAM Sub-Type Code, or MAC Control Packet opcode OAM Sub-Type Code If Bits[18:16] of RDES3 are set to 3'b111, this field contains the OAM sub-type and code fields. MAC Control Packet opcode If Bits[18:16] of RDES3 are set to 3'b110, this field contains the MAC Control packet opcode field.
15	TD	Timestamp Dropped This bit indicates that the timestamp was captured for this packet but it got dropped in the MTL Rx FIFO because of overflow. This bit is available only when you select the Timestamp feature. Otherwise, this bit is reserved.
14	TSA	Timestamp Available When Timestamp is present, this bit indicates that the timestamp value is available in a context descriptor word 2 (RDES2) and word 1(RDES1). This is valid only when the Last Descriptor bit (RDES3 [28]) is set. The context descriptor is written in the next descriptor just after the last normal descriptor for a packet.
13	PV	PTP Version This bit indicates that the received PTP message has the IEEE 1588 version 2 format. When this bit is reset, it indicates the IEEE 1588 version 1 format. This bit is available only when you select the Timestamp feature. Otherwise, this bit is reserved.
12	PFT	PTP Packet Type This bit indicates that the PTP message is sent directly over Ethernet. This bit is available only when you select the Timestamp feature. Otherwise, this bit is reserved.
11:8	PMT	PTP Message Type These bits are encoded to give the type of the message received: ■ 0000: No PTP message received ■ 0001: SYNC (all clock types)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Name	Description
		■ 0010: Follow_Up (all clock types) ■ 0011: Delay_Req (all clock types) ■ 0100: Delay_Resp (all clock types) ■ 0101: Pdelay_Req (in peer-to-peer transparent clock) ■ 0110: Pdelay_Resp (in peer-to-peer transparent clock) ■ 0111: Pdelay_Resp_Follow_Up (in peer-to-peer transparent clock) ■ 1000: Announce ■ 1001: Management ■ 1010: Signaling ■ 1011–1110: Reserved ■ 1111: PTP packet with Reserved message type These bits are available only when you select the Timestamp feature.
7	IPCE	IP Payload Error When this bit is set, it indicates either of the following: ■ The 16-bit IP payload checksum (that is, the TCP, UDP, or ICMP checksum) calculated by the MAC does not match the corresponding checksum field in the received segment. ■ The TCP, UDP, or ICMP segment length does not match the payload length value in the IP Header field. ■ The TCP, UDP, or ICMP segment length is less than minimum allowed segment length for TCP, UDP, or ICMP. Bit 15 (ES) of RDES3 is not set when this bit is set.
6	IPCB	IP Checksum Bypassed This bit indicates that the checksum offload engine is bypassed. This bit is available when you select the Enable Receive TCP/IP Checksum Check feature.
5	IPV6	IPv6 header Present This bit indicates that an IPV6 header is detected. When the Enable Split Header Feature option is selected and the SPH bit of Control Register of a channel is set, the IPV6 header is available in the header buffer area to which RDES0 is pointing.
4	IPV4	IPV4 Header Present This bit indicates that an IPV4 header is detected. When the SPH bit of RDES3 is set, the IPV4 header is available in the header buffer area to which RDES0 is pointing.
3	IPHE	IP Header Error When this bit is set, it indicates either of the following: ■ The 16-bit IPv4 header checksum calculated by the MAC does not match the received checksum bytes. ■ The IP datagram version is not consistent with the Ethernet Type value. ■ Ethernet packet does not have the expected number of IP header bytes. This bit is valid when either Bit 5 or Bit 4 is set. This bit is available when you select the Enable Receive TCP/IP Checksum Check feature.
2:0	PT	Payload Type

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Name	Description
		These bits indicate the type of payload encapsulated in the IP datagram processed by the Receive Checksum Offload Engine (COE): ■ 3'b000: Unknown type or IP/AV payload not processed ■ 3'b001: UDP ■ 3'b010: TCP ■ 3'b011: ICMP ■ 3'b110: AV Tagged Data Packet ■ 3'b111: AV Tagged Control Packet ■ 3'b101: AV Untagged Control Packet ■ 3'b100: IGMP if IPV4 Header Present bit is set else DCB (LLDP) Control Packet If the COE does not process the payload of an IP datagram because there is an IP header error or fragmented IP, it sets these bits to 3'b000.

Table 8-23 TDES2 Normal Descriptor(Write-Back Format)

Bit	Name	Description
31:29	L3L4FM	Layer 3 and Layer 4 Filter Number Matched These bits indicate the number of the Layer 3 and Layer 4 Filter that matched the received packet: ■ 000: Filter 0 ■ 001: Filter 1 ■ 010: Filter 2 ■ 011: Filter 3 ■ 100: Filter 4 ■ 101: Filter 5 ■ 110: Filter 6 ■ 111: Filter 7 This field is valid only when Bit 28 or Bit 27 is set high. When more than one filter matches, these bits give the number of lowest filter. Note: This status is not available when Flexible RX Parser is enabled.
28	L4FM	Layer 4 Filter Match When this bit is set, it indicates that the received packet matches one of the enabled Layer 4 Port Number fields. This status is given only when one of the following conditions is true: ■ Layer 3 fields are not enabled and all enabled Layer 4 fields match ■ All enabled Layer 3 and Layer 4 filter fields match When more than one filter matches, this bit gives the layer 4 filter status of filter indicated by Bits[31:29]. Note: This status is not available when Flexible RX Parser is enabled.
27	L3FM	Layer 3 Filter Match When this bit is set, it indicates that the received packet matches one of the enabled Layer 3 IP Address fields. This status is given only when one of the following conditions is true: ■ All enabled Layer 3 fields match and all enabled Layer 4 fields are bypassed ■ All enabled filter fields match When more than one filter matches, this bit gives the layer 3 filter status of filter indicated by Bits[31:29].

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Name	Description
		Note: This status is not available when Flexible RX Parser is enabled.
26:19	MADRM	MAC Address Match or Hash Value When the HF bit is reset, this field contains the MAC address register number that matched the Destination address of the received packet. This field is valid only if the DAF bit is reset. When the HF bit is set, this field contains the hash value computed by the MAC. A packet passes the hash filter when the bit corresponding to the hash value is set in the hash filter register. Note: This status is not available when Flexible RX Parser is enabled.
18	HF	Hash Filter Status When this bit is set, it indicates that the packet passed the MAC address hash filter. Bits[26:19] indicate the hash value. Note: This status is not available when Flexible RX Parser is enabled.
17	DAF/RXPI	Destination Address Filter Fail When Flexible RX Parser is disabled, and this bit is set, it indicates that the packet failed the DA Filter in the MAC. When Flexible RX Parser is enabled, this bit is set to indicate that the packet parsing is incomplete (RXPI) due to ECC error. Note: When this bit is set, ES bit of RDES3 is also set.
16	SAF/RXPD	SA Address Filter Fail When Flexible RX Parser is disabled, and this bit is set, it indicates that the packet failed the SA Filter in the MAC. When Flexible RX Parser is enabled, this bit is set to indicate that the packet is dropped (RXPD) by the parser. Note: When this bit is set, ES bit of RDES3 is also set.
15	OTS	VLAN Filter Status When set, this bit indicates that the VLAN Tag of the received packed passed the VLAN filter. This bit is valid only when GMAC_ERVFE is not enabled. If GMAC_ERVFE is enabled, the bit is redefined as Outer VLAN Tag Filter Status (OTS). This bit is valid for both Single and Double VLAN Tagged frames.
14	ITS	Inner VLAN Tag Filter Status (ITS) This bit is valid only when GMAC_ERVFE is enabled. This bit is valid only for Double VLAN Tagged frames, when Double VLAN Processing is enabled. For more information, see the Filter Status topic.
13:11	Reserved	Reserved
10	ARPNR	ARP Reply Not Generated When this bit is set, it indicates that the MAC did not generate the ARP Reply for received ARP Request packet. This bit is set when the MAC is busy transmitting ARP reply to earlier ARP request (only one ARP request is processed at a time).

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Name	Description
		This bit is reserved when the Enable IPv4 ARP Offload option is not selected.
9:0	HL	L3/L4 Header Length This field contains the length of the header of the packet split by the MAC at L3 or L4 header. boundary as identified by the MAC receiver. This field is valid only when the first descriptor bit is set (FD = 1). The header data is written to the Buffer 1 address of corresponding descriptor. If header length is zero, this field is not valid. It implies that the MAC did not identify and split the header. This field is valid when the Enable Split Header Feature option is selected.

Table 8-24 TDES3 Normal Descriptor(Write-Back Format)

Bit	Name	Description
31	OWN	Own Bit When this bit is set, it indicates that the GMAC DMA owns the descriptor. When this bit is reset, it indicates that the application owns the descriptor. The DMA clears this bit when either of the following conditions is true: ■ The DMA completes the packet reception ■ The buffers associated with the descriptor are full
30	CTXT	Receive Context Descriptor When this bit is set, it indicates that the current descriptor is a context type descriptor. The DMA writes 1'b0 to this bit for normal receive descriptor. When CTXT and FD bits are used together, {CTXT, FD} ■ 2'b00: Intermediate Descriptor ■ 2'b01: First Descriptor ■ 2'b10: Reserved ■ 2'b11: Descriptor Error (due to all 1s) Note: When Descriptor Error occurs, the Receive DMA closes the receive descriptor indicating Descriptor Error. This receive descriptor is skipped and the buffer addresses are not used to write the packet data Receive DMA will set the CDE bit in DMA_CH#_Status register but not the RI bit even when IOC is set, as this is not marked as last receive descriptor for the packet. The subsequent valid receive descriptor is used to write the packet data.
29	FD	First Descriptor When this bit is set, it indicates that this descriptor contains the first buffer of the packet. If the size of the first buffer is 0, the second buffer contains the beginning of the packet. If the size of the second buffer is also 0, the next descriptor contains the beginning of the packet. See the CTXT bit description for details of using the CTXT bit and FD bit together.
28	LD	Last Descriptor When this bit is set, it indicates that the buffers to which this descriptor is pointing are the last buffers of the packet.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Name	Description
27	RS2V	Receive Status RDES2 Valid When this bit is set, it indicates that the status in RDES2 is valid and it is written by the DMA. This bit is valid only when the LD bit of RDES3 is set.
26	RS1V	Receive Status RDES1 Valid When this bit is set, it indicates that the status in RDES1 is valid and it is written by the DMA. This bit is valid only when the LD bit of RDES3 is set.
25	RS0V	Receive Status RDES0 Valid When this bit is set, it indicates that the status in RDES0 is valid and it is written by the DMA. This bit is valid only when the LD bit of RDES3 is set.
24	CE	CRC Error When this bit is set, it indicates that a Cyclic Redundancy Check (CRC) Error occurred on the received packet. This field is valid only when the LD bit of RDES3 is set.
23	GP	Giant Packet When this bit is set, it indicates that the packet length exceeds the specified maximum Ethernet size of 1518, 1522, or 2000 bytes (9018 or 9022 bytes if jumbo packet enable is set). Note: Giant packet indicates only the packet length. It does not cause any packet truncation.
22	RWT	Receive Watchdog Timeout When this bit is set, it indicates that the Receive Watchdog Timer has expired while receiving the current packet. The current packet is truncated after watchdog timeout.
21	OE	Overflow Error When this bit is set, it indicates that the received packet is damaged because of buffer overflow in Rx FIFO. Note: This bit is set only when the DMA transfers a partial packet to the application. This happens only when the Rx FIFO is operating in the threshold mode. In the store-and-forward mode, all partial packets are dropped completely in Rx FIFO.
20	RE	Receive Error When this bit is set, it indicates that the gmii_rxer_i signal is asserted while the gmii_rxdv_i signal is asserted during packet reception. This error also includes carrier extension error in the GMII and half-duplex mode. Error can be of less or no extension, or error (rxd!= 0f) during extension.
19	DE	Dribble Bit Error When this bit is set, it indicates that the received packet has a non-integer multiple of bytes (odd nibbles). This bit is valid only in the MII Mode.
18:16	LT	Length/Type Field This field indicates if the packet received is a length packet or a type packet. The encoding of the 3 bits is as follows: ■ 3'b000: The packet is a length packet ■ 3'b001: The packet is a type packet. ■ 3'b011: The packet is a ARP Request packet type

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Name	Description
		■ 3'b100: The packet is a type packet with VLAN Tag ■ 3'b101: The packet is a type packet with Double VLAN Tag ■ 3'b110: The packet is a MAC Control packet type ■ 3'b111: The packet is a OAM packet type ■ 3'b010: Reserved
15	ES	Error Summary When this bit is set, it indicates the logical OR of the following bits: ■ RDES3[24]: CRC Error ■ RDES3[19]: Dribble Error ■ RDES3[20]: Receive Error ■ RDES3[22]: Watchdog Timeout ■ RDES3[21]: Overflow Error ■ RDES3[23]: Giant Packet ■ RDES2[17]: Destination Address Filter Fail, when Flexible RX Parser is enabled ■ RDES2[16]: SA Address Filter Fail, when Flexible RX Parser is enabled This field is valid only when the LD bit of RDES3 is set.
14	PL	Packet Length These bits indicate the byte length of the received packet that was transferred to system memory (including CRC). This field is valid when the LD bit of RDES3 is set and Overflow Error bits are reset. The packet length also includes the two bytes appended to the Ethernet packet when IP checksum calculation is enabled and the received packet is not a MAC control packet. This field is valid when the LD bit of RDES3 is set. When the Last Descriptor and Error Summary bits are not set, this field indicates the accumulated number of bytes that have been transferred for the current packet.

8.6.10 Receive Context Descriptor

This descriptor is read-only for the application. Only the DMA can write to this descriptor. The context descriptor provides information about the extended status related to the last received packet. The Bit 30 of RDES3 indicates the context type descriptor.

Table 8-25 TDES0 Context Descriptor

Bit	Name	Description
31:0	RSTL	Receive Packet Timestamp Low The DMA updates this field with least significant 32 bits of the timestamp captured for corresponding Receive packet. When this field and the RTSH field of RDES1 show all-ones value, the timestamp must be considered as corrupt.

Table 8-26 TDES1 Context Descriptor

Bit	Name	Description
31:0	RSTH	Receive Packet Timestamp High The DMA updates this field with most significant 32 bits of the timestamp captured for corresponding receive packet. When this field and the RTSL field of

8.6.11 Clock Architecture

In RMII mode, reference clock and TX/RX clock can be from CRU or external OSC as following figure. The mux selecting rmii_speed is SDGMAC_GRF_GMAC_CON0[5]/SDGMAC_GRF_GMAC_CON1[5].

Copyright © 2024 Rockchip Electronics Co., Ltd.

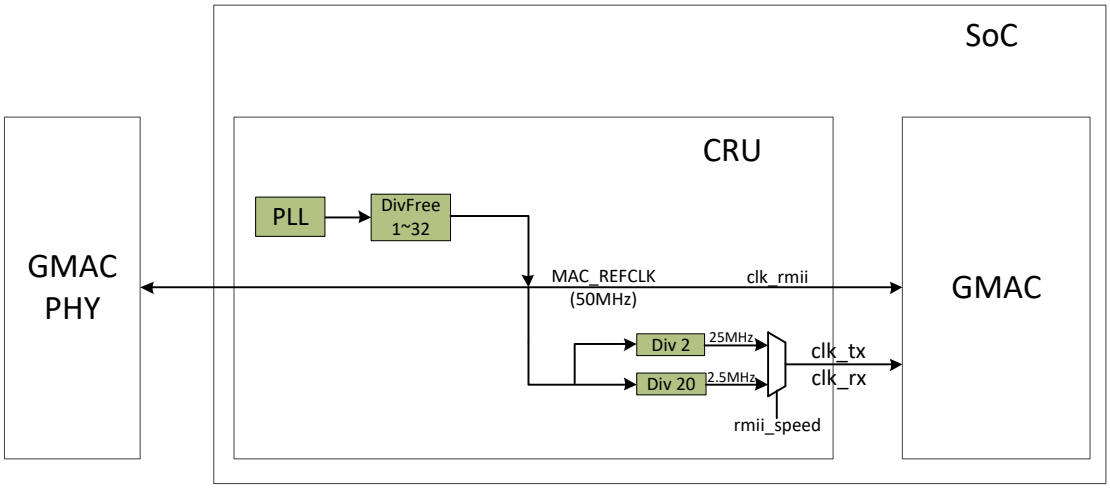

Fig. 8-11 RMII Clock Architecture When Clock Source From CRU

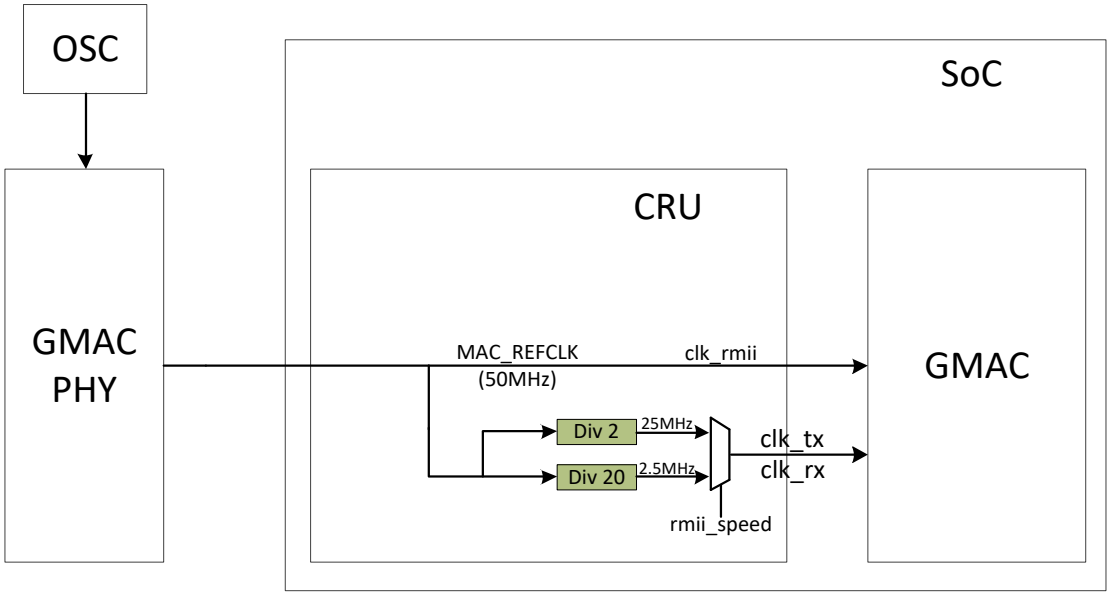

Fig. 8-12 RMII Clock Architecture When Clock Source From External OSC

In RGMII mode, clock architecture only supports that TX clock source is from CRU as following figure. In order to dynamically adjust the timing between TX/RX clocks with data, there are 4 sets of delayline which is integrated in TX and RX clock path. Please see the register VCCIO_IOC_MISC_CON2/3/4/5 about how to enable the delayline and configure the delay length. There are 100 delay elements in each delayline.

Chapter 9 Process-Voltage-Temperature Monitor (PVTM)

9.1 Overview

The Process-Voltage-Temperature Monitor (PVTM) is used to monitor the chip performance variance caused by chip process, voltage and temperature.
PVTM supports the following features:

- A clock oscillation ring is integrated and used to generate a clock like signal, the frequency of this clock is determined by the cell delay value of clock oscillation ring circuit.
- A calculation logic is used to measure the frequency of the clock oscillation ring.
- Follow PVTM blocks are supported:
  - PMU_PVTM, used near PMU

9.2 Block Diagram

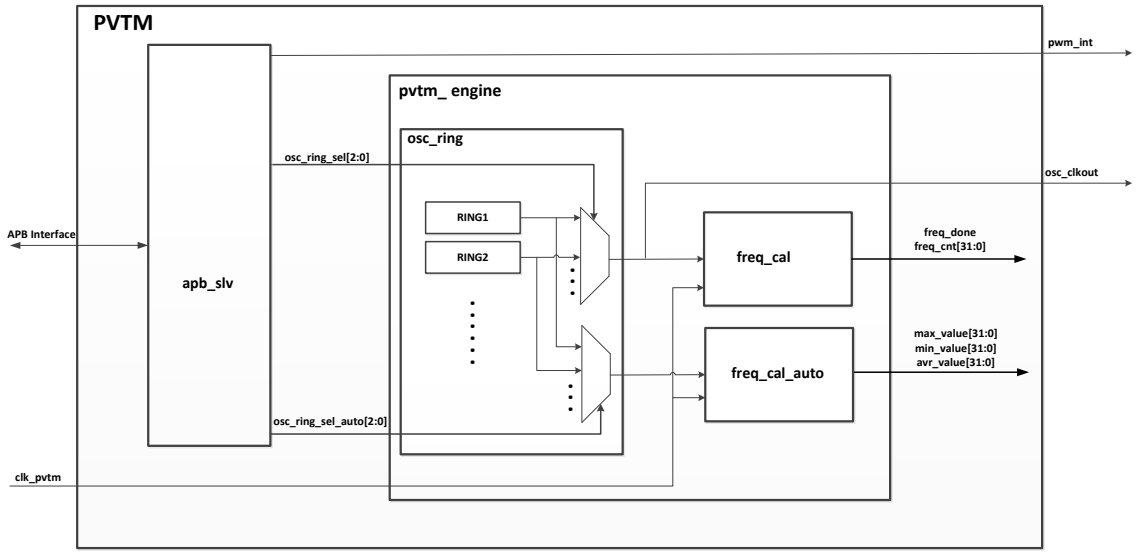

Fig. 9-1 PVTM Block Diagram

The PVTM include two main blocks:

- apb_slv

APB slave interface with 32-bit bus width.

- pvtm_engine

It is composed with inverters with odd number, which is used to generate a clock.
PMU_PVTM only supports one clock oscillation rings. The PMU_PVTM only support manual mode.

9.3 Function Description

9.3.1 Frequency Calculation

A clock is generated by the oscillation ring and a frequency fixed clock clk_pvtm is used to calculate the cycles of the clock. Supposing the time period is 1s, then the clock period of oscillation ring clock is T= 1/clock_counter(s), the cell delay value is T/2.
For manual mode, user can only get one frequency result for a calculation.
For auto mode, user can set the calculation times, and get the maximum, minimum and average frequency during calculation. It also support to generate an interrupt when the minimum or average frequency below a threshold. The threshold can be configured.

9.3.2 Low power mode usage

A clock divided from PMU_PVTM oscillation ring is used in low power mode, which can replace the function of 32KHz clock source

31:16	RO	0x0000	pvtm_avr_cnt PVTM average calculation current count
15:0	RO	0x0000	pvtm_cal_cnt PVTM calculation current counter

9.5 Application Notes

9.5.1 PVTM Manual mode Usage Flow

1. Enable the frequency fixed clock clk_pvtm.
2. Reset the PVTM.
3. Set pvtm_osc_en to enable the generated clock.
4. Set pvtm_osc_sel to select the clock oscillation ring.
5. Set the pvtm_cal_cnt to an appropriate value.
6. Set pvtm_start to calculate the cycles of the generated clock.
7. Wait the pvtm_freq_done is asserted, then get the value of pvtm_freq_cnt. The period OSC_RING clock is T= cal_cnt*(Period of clk_pvtm clock)/freq_cnt, the cell delay value is T/2.

9.5.2 PVTM Auto mode Usage Flow

1. Enable the frequency fixed clock clk_pvtm.
2. Reset the PVTM.
3. Set pvtm_osc_en_auto to enable the generated clock.
4. Set pvtm_osc_sel_auto to select the clock oscillation ring.
5. Set pvtm_cal_cnt_auto to an appropriate value.
6. Set pvtm_cal_period to configure the all calculation times

Copyright © 2024 Rockchip Electronics Co., Ltd.

7. Set pvtm_avr_period to configure the average times
8. Set cal_done_Int_en to enable the interrupt
9. Set pvtm_start_auto to calculate the cycles of the generated clock.
10. Wait the interrupt is asserted, then get the value of pvtm_min_value/pvtm_max_value/ pvtm_avr_value. The minimum period OSC_RING clock is T= cal_cnt_auto*(Period of clk_pvtm clock)/pvtm_min_value, the minimum cell delay value is T/2. The frequency calculation of average and maximum value are same with minimum value.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Chapter 10 PVTPLL

10.1 Overview

PVTPLL is used to monitor the chip performance variance caused by chip process, voltage and temperature, and generate a set of reference signals for adjusting the voltage of the chip.

PVTPLL supports the following features:

- A clock oscillation ring is integrated and used to generate a clock like signal (osc_clk), the frequency of this clock is determined by the cell delay value of clock oscillation ring circuit
- A frequency counter(osc_cnt) is used to measure the frequency of 'osc_clk'
- A externally input clock (ref_clk) is used as a reference clock for detecting the frequency of 'osc_clk'
- A calculation counter uses 'ref_clk' to generate a configurable periodic timing window
- Two clock counters are used to measure the frequency of the clock generated by OSC_WRAPPER
- Support for dividing the ref_clk and osc_clk
- Support for configuring the effective polarity of the voltage regulator signal 'OUT'
- Seven PVTPLL is instantiated in RK3576: BIGCORE_PVTPLL, LITCORE_PVTPLL, CCI_PVTPLL, DDR_PVTPLL, CRU_PVTPLL, GPU_PVTPLL and NPU_PVTPLL
- BIGCORE_PVTPLL, LITCORE_PVTPLL, CCI_PVTPLL
  - Support 4 different types of inverter cell selection
  - Support 64 levels of different length inverter osc_ring selection
- DDR_PVTPLL, CRU_PVTPLL, GPU_PVTPLL and NPU_PVTPLL
  - Support 3 different types of inverter cell selection
  - Support 64 levels of different length inverter osc_ring selection

10.2 Block Diagram

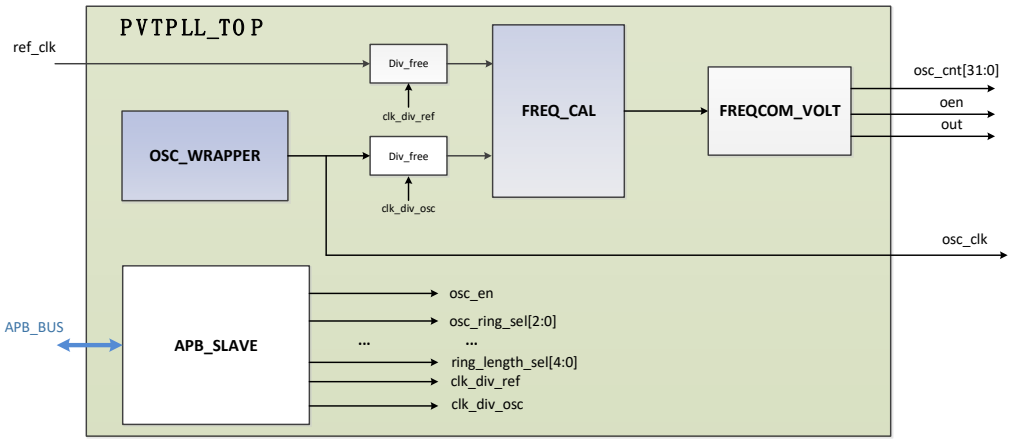

Fig. 10-1 PVTPLL Block Diagram

The PVTPLL include four main blocks:

(1)OSC_RING: it is composed with inverters with odd number, which is used to generate a clock. And PVTPLL support multiple type clock oscillation ring and different length osc_ring.

(2)FREQ_CAL: it is used to measure the frequency of clock which generated from the RING_OSC block. Clock counters are inside.

(3)FREQCOMP_VOLT: it is used to generate a set of reference signals for adjusting the voltage of the chip.

(4)APB_SLAVE: it is used to configure internal registers.

Copyright © 2024 Rockchip Electronics Co., Ltd.

10.3 Function Description

10.3.1 OSC RING

Each PVTPLL contains multiple OSC_RINGs that use different types of inverter cell. The number of OSC_RING is defined according to the requirements of each item. "gck_ring_sel[2:0]" is used to select which OSC_RING to use. The correspondence between "gck_ring_sel[2:0]" and the type of inverter cell is shown in the following table. The number of inverters in each OSC_RING can also be selected by the interface signal "gck_ring_len_sel". The correspondence between "gck_ring_len_sel" and the number of inverters is shown in the following table.

Table 10-1 Inverter Cell Type

Instance	ring_sel	Inverter Cell Type
BIGCORE_PVTPLL LITCORE_PVTPLL CCI_PVTPLL	0	LVT
	1	SVT
	2	SLT
	3	HVT
CRU_PVTPLL NPU_PVTPLL GPU_PVTPLL DDR_PVTPLL	0	LVT
	1	SVT
	2	HVT

10.3.2 Frequency Measurement

'osc_clk' is generated by the internal OSC_RING. The time-counter is used to measure the frequency of 'osc_clk', and the time-counter uses ref_clk as counting clock. PVTPLL generates a signal for frequency stabilization by comparing the count values of osc_cnt and ref_cnt in the same time period.

The measurement period is configured through the interface signal cal_cnt[31:0]. At the end of each measurement period, the value of osc_cnt is equivalent to the frequency of osc_clk. The osc_cnt value is compared with the reference value ref_cnt to generate a signal(out) for external voltage regulation.

10.3.3 Voltage Regulation Signal

After starting the auto-regulation function, if gck_cnt[31:0] > (gck_ref_val[31:0]+gck_thr[31:0]) or gck_cnt[31:0] < (gck_ref_val[31:0]-gck_thr[31:0]), the voltage regulation enable signal 'gck_oen' is set to 0, and the value of the voltage adjustment signal 'out' changes according to the set voltage regulation polarity signal 'out_polar', and the corresponding relationship is as shown below:

Out_polar=0: 'gck_out=1' when need to increase voltage; 'gck_out=0' when need to reduce voltage.

Out_polar=1: 'gck_out=0' when need to increase voltage; 'gck_out=1' when need to reduce voltage.

10.4 RegisterDescription

10.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

Operational Base

pvtpll_adc_cnt_valid	0x0068	W	0x00000000	ADC Clock Frequency Valid Flag
pvtpll_version	0x0070	W	0x20230710	VERSION

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

10.4.3 Detail Registers Description

pvtpll_ring_en

Address: **Operational Base** + offset (0x0000)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3	RW	0x0	ring3_en Ring3 enable
2	RW	0x0	ring2_en Ring2 enable
1	RW	0x0	ring1_en Ring1 enable
0	RW	0x0	ring0_en Ring0 enable

pvtpll_ring0_length

Address: **Operational Base** + offset (0x0004)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8:0	RW	0x000	ring0_len Ring0 Length Selection.

pvtpll_ring1_length

Address: **Operational Base** + offset (0x0008)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8:0	RW	0x000	ring1_len Ring1 Length Selection.

pvtpll_ring2_length

Address: **Operational Base** + offset (0x000C)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8:0	RW	0x000	ring2_len Ring2 Length Selection.

pvtpll_ring3_length

Address: **Operational Base** + offset (0x0010)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8:0	RW	0x000	ring3_len Ring3 Length Selection.

pvtpll_gck_cfg

Address: **Operational Base** + offset (0x0020)

Bit	Attr	Reset Value	Description
31:14	RO	0x00000	reserved
13	RW	0x0	ring3_boot_mode osc_ring3 Boot Mode Configuration 1'b0: nand gate startup mode; 1'b1: DFF startup mode.
12	RW	0x0	ring2_boot_mode osc_ring2 Boot Mode Configuration 1'b0: nand gate startup mode; 1'b1: DFF startup mode.
11	RW	0x0	ring1_boot_mode osc_ring1 Boot Mode Configuration 1'b0: nand gate startup mode; 1'b1: DFF startup mode.
10	RW	0x0	ring0_boot_mode osc_ring0 Boot Mode Configuration 1'b0: nand gate startup mode; 1'b1: DFF startup mode.
9:7	RO	0x0	reserved
6	RW	0x0	gck_rstn reset for gck module.
5	RW	0x0	gck_mode gck_mode enable.
4	RW	0x0	clk_out_sel Output Clock Selection 1'b0: osc_clk; 1'b1: osc_clk_div50.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
3	RW	0x0	out_polar out_polar 0: 'out=1' when need to incr volt 1: 'out=0' when need to incr volt
2	RW	0x0	gck_bypass 0: Support glitch-free frequency switching 1: Not support
1	RW	0x0	gck_en osc_en for gck_mode.
0	RW	0x0	gck_start freq_cal_gck module initiates measurement of frequency signal.

pvtpll_gck_len

Address: **Operational Base** + offset (0x0024)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12:10	RW	0x0	gck_ring_sel osc ring select for freq_gck_cal.
9	RO	0x0	reserved
8:0	RW	0x000	gck_ring_len_sel osc ring inverter length select for freq_gck_cal.

pvtpll_gck_div

Address: **Operational Base** + offset (0x0028)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	write_mask Write Mask for gck_div[15:0].
15:12	RO	0x0	reserved
11:7	RW	0x00	clk_div_tclk Frequency division factor for test_clkout.
6	RO	0x0	reserved
5:4	RW	0x0	clk_div_out Frequency division factor for output clk.
3:2	RW	0x0	clk_div_osc Frequency division factor for osc_clk.
1:0	RW	0x0	clk_div_ref Frequency division factor for ref_clk.

pvtpll_gck_cal_cnt

Address: **Operational Base** + offset (0x002C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	gck_cal_cnt Used to configure the frequency measurement period of the freq_cal_adc module.

pvtpll_gck_ref_val

Address: **Operational Base** + offset (0x0030)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	gck_ref_val Target reference frequency value

pvtpll_gck_ckg_val

Address: **Operational Base** + offset (0x0034)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:15	RO	0x00000	reserved
14:0	RW	0x0000	gck_ckg_val Clk-gating interval control count value.

pvtpll_gck_thr

Address: **Operational Base** + offset (0x0038)

Bit	Attr	Reset Value	Description
31:15	RO	0x00000	reserved
14:0	RW	0x0000	gck_thr Count difference threshold value.

pvtpll_gfree_con

Address: **Operational Base** + offset (0x003C)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3:2	RW	0x0	filter_cycle_sel 2'b00: 1cycle; 2'b01: 2cycles; 2'b10: 3cycles; 2'b11: 4cycles.
1	RO	0x0	reserved
0	RW	0x0	glitch_free_mode 1'b0: CKG Mode; 1'b1: ICG Mode.

pvtpll_adc_cfg

Address: **Operational Base** + offset (0x0040)

Bit	Attr	Reset Value	Description
31:16	WO	0x0000	write_mask Write Mask for adc_cfg[15:0].
15:4	RO	0x000	reserved
3:2	RW	0x0	adc_osc_sel Clock selection signal for the freq_cal_adc module's measurement. 2'b00: ring0_osc_clk; 2'b01: ring1_osc_clk; 2'b10: ring2_osc_clk; 2'b11: ring3_osc_clk.
1	RW	0x0	adc_en freq_cal_adc module enable signal.
0	RW	0x0	adc_start freq_cal_adc module initiates measurement of frequency signal.

pvtpll_adc_cal_cnt

Address: **Operational Base** + offset (0x0048)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	adc_cal_cnt Used to configure the frequency measurement period of the freq_cal_adc module.

pvtpll_gck_cnt

Address: **Operational Base** + offset (0x0050)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	gck_cnt Clock frequency value measured by freq_cal_gck.

Copyright © 2024 Rockchip Electronics Co., Ltd.

pvtpll_gck_cnt_avg
Address: **Operational Base** + offset (0x0054)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	gck_cnt_avg freq_cal_gck measured clock frequency average.

pvtpll_gck_state
Address: **Operational Base** + offset (0x005C)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2	RO	0x0	gck_oen Voltage regulation enable signal. Low active.
1	RO	0x0	gck_out Voltage regulation indication signal.
0	RO	0x0	gck_cnt_valid gck_cnt Valid Flag. 1'b0: Valid; 1'b1: Invalid.

pvtpll_adc_cnt
Address: **Operational Base** + offset (0x0060)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	adc_cnt Clock frequency value measured by freq_cal_adc.

pvtpll_adc_cnt_avg
Address: **Operational Base** + offset (0x0064)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	adc_cnt_avg freq_cal_adc measured clock frequency average.

pvtpll_adc_cnt_valid
Address: **Operational Base** + offset (0x0068)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RO	0x0	adc_cnt_valid adc_cnt Valid Flag. 1'b0: Valid; 1'b1: Invalid.

pvtpll_version
Address: **Operational Base** + offset (0x0070)

Bit	Attr	Reset Value	Description
31:0	RO	0x20230710	version Version Number = 32'h20230710.

10.5 Application Notes

1. Configure gck_ring_sel and gck_ring_len_sel.
2. Set gck_mode and gck_en to 1 to enable the generated clock.
3. Configure gck_cal_cnt, gck_ref_val and gck_thr, and set out_polar to appropriate value.
4. Set gck_start to 1 to start automatic detection of the frequency.

Chapter 11 Video Output Processor (VOP)

11.1 Overview

The VOP (video output process) module is a display output processor. It reads video data and UI data from the frame buffer of the system memory, performs corresponding processing such as cropping, color gamut space conversion, scaling, and superposition, and outputs to each high-speed display interface.

VOP supports the following features:

- Display Output Interface
  - DP Interface
    - Max support 4096x2160@yuv422-120Hz
    - Support RGB/YUV444/YUV422/YUV420 (up to 10bit) format
    - Support MST
  - HDMI / eDP Combo Interface
    - HDMI
      - Max resolution support 4096x2160@yuv444-120Hz
      - Support RGB/YUV444/YUV422/YUV420 (up to 10bit) format
    - eDP
      - Max resolution support 4096x2160@yuv444-60Hz
      - Support RGB/YUV444/YUV422 (up to 10bit) format
  - MIPI DSI2 Interface
    - Max resolution support 2560x1600@60Hz
    - Support RGB (up to 10bit) format
  - Parallel Interface
    - BT.656
      - Support PAL and NTSC
      - Support YUV422 (up to 8bit) format
      - Support Progressive and Interlace
      - Max resolution support 720x576@60Hz
    - BT.1120
      - Max resolution support 1920x1080@60Hz
      - Support Progressive and Interlace
      - Support YUV422 (up to 8bit) format
    - RGB_24BIT
      - Support RGB888/RGB565/RGB666 format
      - Max resolution support 1920x1080@60Hz
    - MCU
      - Support RGB888/RGB565/RGB666 format
      - Support Serial 2*8 RGB565 format
      - Support Serial 3*8 RGB666/RGB888 format
- Bus
  - One 32bit AHB Slave to configure registers
  - Two 128bit AXI read bus
  - One 128bit AXI write bus
- Video Ports
  - Video Port0
    - Resolution
      - Max output resolution: 4096x2160@120Hz
      - Bits per component: 10
    - Color bar
      - Horizontal mode
      - Vertical mode
    - 3D_LUT
      - Support 9x9x9 (12bit) LUT
    - ACM
      - Brightness, Saturation, Hue adjustment

    - Image
        - Support virtual width (max 8K word)
        - Support active offset
        - Support display offset
        - Support Y/X mirror
            - AFBC/RFBC support X mirror and Y mirror
            - Raster and tile only support Y mirror
        - Swap: alpha/RB/UV/RG swap
        - Support YUV clip
    - Cluster Line Buff Mode
        - Mode0: 1 x 4096 width layer mode
        - Mode1: 2 x 2048 width layer mode
    - Scale
        - Scale down
            - Support scale rate 1/8~1
            - Support Pre-scale: Avg2/4, Gt2/4
            - Scale mode: Best-neigh/Bilinear/Multi-phase filter
        - Scale up
            - Support scale rate 1~8
            - Y_scale mode: Best-neigh/Bilinear/Multi-phase filter
            - X_scale mode: Best-neigh/Bilinear/Multi-phase filter
    - CSC
        - YUV2RGB

- RGB2YUV: BT601_L/BT709_L/BT601_F/BT2020

- DCI
  - Only CLUSTER0_WIN0 support

- ESMART 0/1/2/3
  - Horizontal scale up:
    - Output max resolution: 4096x2160
  - Horizontal scale down:
    - Input max resolution: 4096x2160
  - ESMART LB MODE
    - support 3*4K model and 2*4k + 2*2k model
  - Data format
    - RGB: ARGB8888/RGB888/RGB565/RGBA1010102/RGBA5551
    - YUV: YUV420/YUV422/YUV444/YUV444i/YUV400 8bit/10bit
    - YUYV: YUYV422/UYVY422
    - BPP: 8BPP
  - Image
    - Support virtual width (max 8k word)
    - Support active offset
    - Support display offset
    - Support Y-mirror
    - Swap: alpha/RB/RG/UV swap
    - Support YUV clip
  - Multi-region
    - Only one region at one line
    - All regions are RGB or YUV format
    - Up to 4 regions
  - Scale
    - Scale down
      - Support scale rate: (1/8:1]
      - Horizontal support 2 level-scale: Pre-scale (avg2/4,gt2/4)
      - Scale mode: Near-best/Bilinear
    - Scale up
      - Support scale rate [1:8]
      - Scale mode: Nearest/Bilinear/Bicubic

    - RGB2YUV: BT601_L/BT709_L/BT601_F/BT2020
- Overlay
  - Support 3 PORT:
    - PORT0: Max overlay 6-layers to port0;
    - PORT1: Max overlay 4-layers to port1;
    - PORT2: Max overlay 4-layers to port2;
  - Support RGB/YUV domain overlay
  - Support layers mux
  - Support per-pixel/global alpha
- Write Back
  Format: ARGB8888/RGB888/RGB565/YUV420
  Max resolution: 1920x1080
  - Support automatic write back and one frame write back model
  - Support horizontal_scale and gt2
  - Support virtual stride
- Interrupt

- Vsync of Post scan timing can connect to GPIO.

11.2 Block Diagram

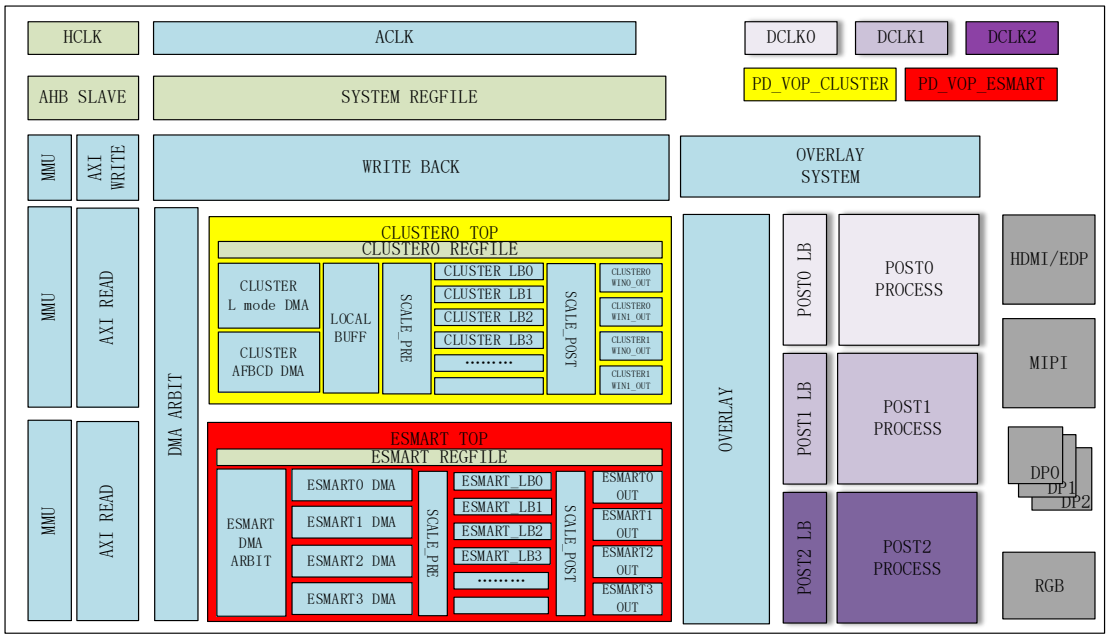

Fig. 11-1 VOP Block Diagram

VOP comprises with:

- AHB SLAVE

The VOP configuration bus is used to read and write all register configurations of the VOP. Some of the address segments are secure SLAVE address segments, which can only be accessed by a secure CPU when the security is enabled. For details, please refer to the security program description chapter.

- SYSTEM REGFILE

The register arrays, including system control, layer, overlay, and post process registers, are read and write all in the ACLK domain, and read and write use it on HCLK. When frm_st signal become 0 to 1, the control signal through from ahb domain to aclk domain.

- MMU

The Memory Management Unit maps the configured virtual address to the physical address through the page table. Since there are two buses in the system, there are two MMU addresses. In the security mode, the address of the security layer is configured as a physical address from the MMU according to the configuration. The module is bypassed, so as to avoid the address being rewritten when the MMU is mapped.

- AXI READ/WRITE

There are AXI0 and AXI1 bus in VOP interface. The AXI0 supports both write and read channel, while AXI1 only supports read channel.

- DMA ARBITER

Each layer in the system will initiate a different read request, and DMA arbiter will perform a global arbitration for internal requests based on priority settings and FIFO status.

- CLUSTERx

Cluster layer, which supports AFBCD、RFBCD、Raster mode and tile mode.

- ESMARTx

Esmart layer only supports line mode and support display up to 4 regions where the regions can’t overlap horizontally.

- OVERLAY

Perform the synthesis operation between layers according to the configuration and send it to the corresponding post process modules.

- POST PROCESS

Including GAMMA, SHARPNES, BCSH, 3D-LUT and other post-processing modules, the data is processed by the post-processing module and then store them into the POST line buffer.

- POST LINE BUFFER

The Post Process line buffer is used to store the data processed by the post process modules and output to corresponding display interface.

- INTERFACE

The VOP supports variety of output interface including HDMI, eDP, DP (SST/MST), MIPI, BT.1120, BT.656. By setting the interface mux, the corresponding PORT can be selected and output to the corresponding interface.

11.3 Operating Mode

11.3.1 Clock and Reset Description

- **HCLK**

The maximum operating frequency: 200MHz

- **ACLK**

The maximum operating frequency: 700MHz

- **DCLK0/1/2**

The maximum operating frequency of DCLK0: 600MHz
The maximum operating frequency of DCLK1: 300MHz
The maximum operating frequency of DCLK2: 150MHz

- **Hardware Reset**

System hardware reset, that is, the hardware reset of the entire VOP through the system, all the logic inside the VOP will enter the initial state, if the current screen is being displayed, there will be abnormal phenomena such as a black screen.

- **Software Frame Reset**

The frame reset of each layer is supported, that is, when the vsync signal of each frame

Copyright © 2024 Rockchip Electronics Co., Ltd.

arrives, the layer's internal logic will be reset exclude register logic.

- **MMU Frame Reset**

Support the MMU soft reset, when the MMU is abnormal, the entire MMU logic can be reset without causing the MMU to hang up.

11.3.2 Bus Description

- **AHB Bus**

Configuration bus for register/LUT.

- **AXI 0 Bus**

The AXI0 bus is readable and writable, which supports write back function. VOP uses AXI0 preferentially because AXI0 is on port 0 of DDR and has a dedicated debug vop_debug. The vop_rd_ urgency0 signal can stop all requests outside port0 when VOP urgently needs bandwidth, achieving the goal of almost only VOP accessing the DDR. Some of the transmission can be placed on AXI0, but because AXI1 is on port 1 of the DDR, and there are high-traffic, high-bandwidth transmission requests such as rknn on port 1, the requests on AXI1 will be greatly affected by rknn. The vop_rd_urgency1 When rknn has a large access, urgency1 cannot guarantee that VOP can compete with rknn. Therefore, AXI0 is prioritized before AXI1.

- **AXI 1 Bus**

Read-only data bus.

- **RID Default Configuration**

There are 5-bit IDs available for each bus. Among them, RID=0x0 is used to load MMU, and RID=0xf is used to achieve AXI master spanning 4KB. Therefore, these two RIDs are prohibited for users to use.

After the VOP system is powered on, the ID allocation of each layer is shown in the table below.

Fig. 11-2 Rid and bus sel in layers

LAYER_NAME	RY_RID	UV_RID	AXI_SEL	BUS SELECT
CLUSTER0_WIN0	0x2	0x3	AXI0	NO
CLUSTER0_WIN1	0x4	0x5	AXI0	NO
CLUSTER1_WIN0	0x6	0x7	AXI0	NO
CLUSTER1_WIN1	0x8	0x9	AXI0	NO
ESMART0	0xa	0xb	AXI0	YES
ESMART1	0xc	0xd	AXI0	YES
ESMART2	0xa	0xb	AXI1	YES
ESMART3	0xc	0xd	AXI1	YES
LUT_VP0	0x1~0xc		AXI1	YES
LUT_VP1	LUT_VP0+1		AXI1	YES
LUT_VP2	LUT_VP0+2		AXI1	YES
LUT_other	0x1~0xc		AXI1	YES
Note: layer rid support bit-5.lut rid support bit-4.				

- **Hurry/QoS**

VOP hurry has an enable bit and hurry value. Initiating a hurry request depends on whether the memory of the layer initiates a hurry request. When the layer's esmart_dma_rreq_hurry _en is enabled and the number of empty memory is greater than the set waterline, a hurry request is initiated.

VOP QoS has an enable bit in SYS_AXI_HURRY_CTRL0/1_IMD. When QoS is enabled and rid is greater than or equal to 0xa, QoS signal is asserted.

- **MMU Frame Valid Mechanism**

MMU support the bypass function in register mmu_bypass_en and mmu_bypass_id. When rid>=mmu_bypass_id, the AXI request and the returned data will bypass MMU. Noted that mmu_bypass_en and mmu_bypass_id is enabled immediately. At that time, rid is effective frame for the layer, so it can realize whether the layer data access is mmu_bypass.

- **Protection Mechanism**

In the protection mode, the port number of the protected layer can be set and sent to the designated protected port, otherwise the layer will be forcibly closed.

11.3.3 Display Output Interface Description

The following figure shows the interface connection diagram of VOP. There are 3 ports in the VOP to distribute video data to different high-speed interfaces through the software setting interface MUX.

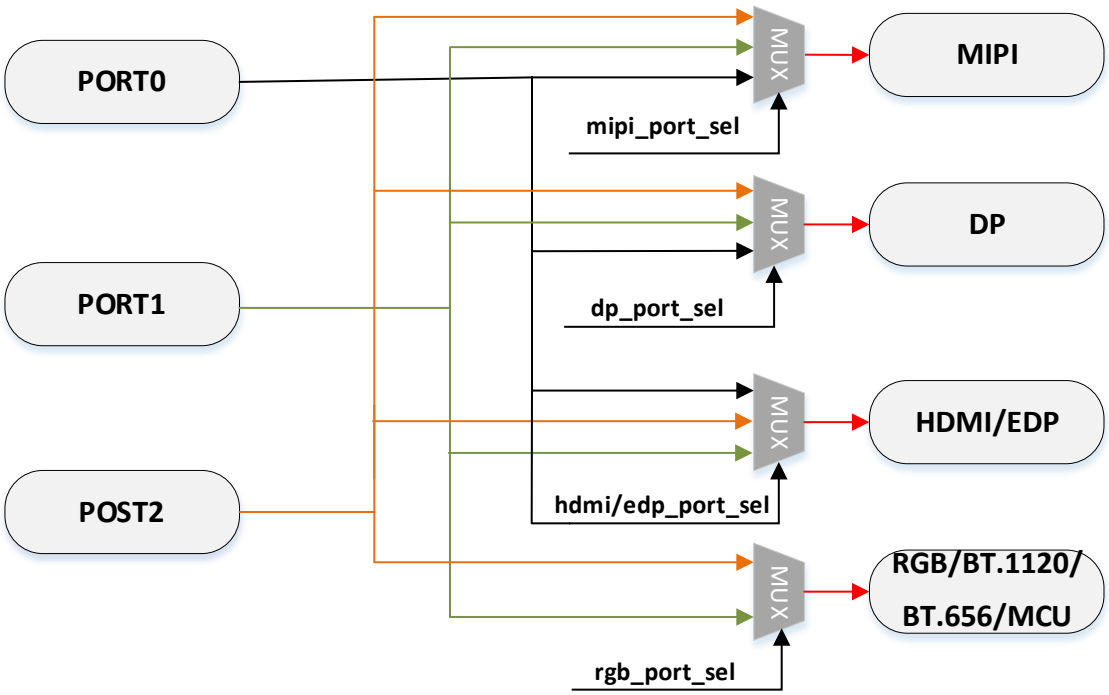

Fig. 11-3 Schematic Diagram of Display Output Interface

- HDMI/eDP Combo Interface
  - The data source of the HDMI/eDP Combo interface can come from port 0 or port 1 or port 2.
  - Maximum resolution support:
    - HDMI: 4096x2160@120 supported by PORT0
    - eDP: 4096x2160@60 supported by PORT0
  - In system, HDMI TX interface and eDP interface share the one Combo PHY, which means VOP can only work in HDMI or eDP mode.
- DP Interface
  - The data source of the DP interface can come from port 0 or port 1 or port 2.
  - The maximum supported resolution (limited by the DP TX PHY's maximum available bandwidth-25.92Gbps):
    4096x2160@120hz: supported by merged function of port 0.
  - Split mode: The one frame is split to left-right part which send to DP TX 0/1/2 respectively.
  - Support MST
    DP interface support MST to 3 channels.
    DP interface enable one DPx mode support max resolution.
    MST_DP0: 4096x2160@120Hz
    MST_DP1: 2560x1440@60Hz
    MST_DP2: 1920x1080@60Hz
    When DP interface in multi mode, transform data maximun bandwidth-25.92Gbps.
- MIPI TX DSI2 Interface
  - The maximum resolution supports 2560x1600@60Hz
    - Support RGB (up to 10bit) format
- BT.656/BT.1120/RGB/MCU
  - BT.1120 and RGB Maximum resolution support: 1080p60, pixel rate 150M/s
  - BT.656 maximum resolution support: 720x576@60Hz
  - The bit mapping relationship corresponding to each interface is as shown in the

Fig. 11-4 Map of parallel port I/O output

11.3.4 Display Output and Interface CLK Description

The VOP_DCLK input and output architecture of dclk is shown in the following figure.

Copyright © 2024 Rockchip Electronics Co., Ltd.

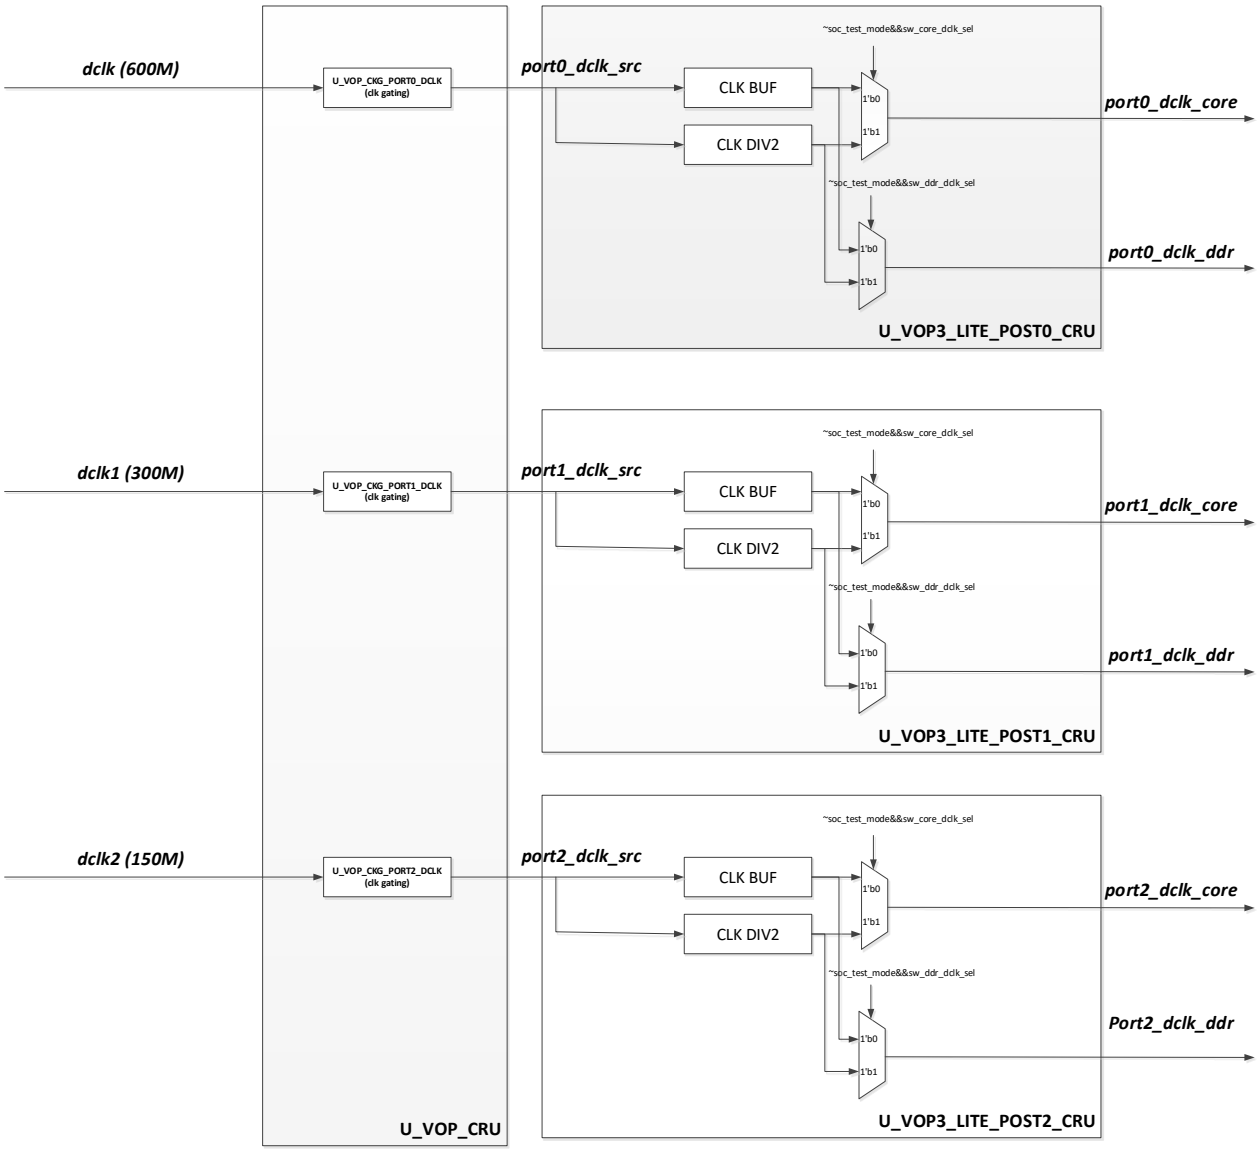

Fig. 11-5 VOP_POST_DCLK CRU

11.3.5 Interrupt Description

There are three interrupt signals.

VOP_INTR: Including the following groups of interrupt sources

- vop_intr_sys
- vop_intr_sys1
- vop_intr_post
  - vp0_intr_post
  - vp1_intr_post
  - vp2_intr_post
- vop_intr_fbcd

VOP_INTR_DDR: Conditional interrupt source dma_finish from DDR frequency conversion, refer to frequency conversion description for details.

VOP_INTR_LB: Including the following groups of interrupt sources, which can set the buffer waterline to notify the CPU that the predetermined waterline has been reached.

- INTR_STATUS_POST_FULL0
- INTR_STATUS_POST_FULL1

11.3.6 Maximum Performance and Functional Attributes of each PORT

- PORT0
  - Maximum supported resolution in single PORT mode is 4096 pixels.
  - Dual gamma
  - 9x9x9 3DLUT
  - Sharp

Copyright © 2024 Rockchip Electronics Co., Ltd.

- ACM
- PORT1
  - Maximum supported resolution of single PORT mode is 2560 pixels.
  - Dual gamma
  - BCSH
- PORT2
  - Maximum supported resolution is 1920 pixels.
  - Dual gamma
  - BCSH

11.3.7 Power Domain Power Up/Down Description

There are two power domains inside VOP, show as the below figures where the green border is the boundary of each power domain.

- Cluster Power Domain: One power domain for cluster0, cluster1 respectively.
- Esmart Power Domain: One power domain for esmart0, esmart1, esmart2 and esmart3.

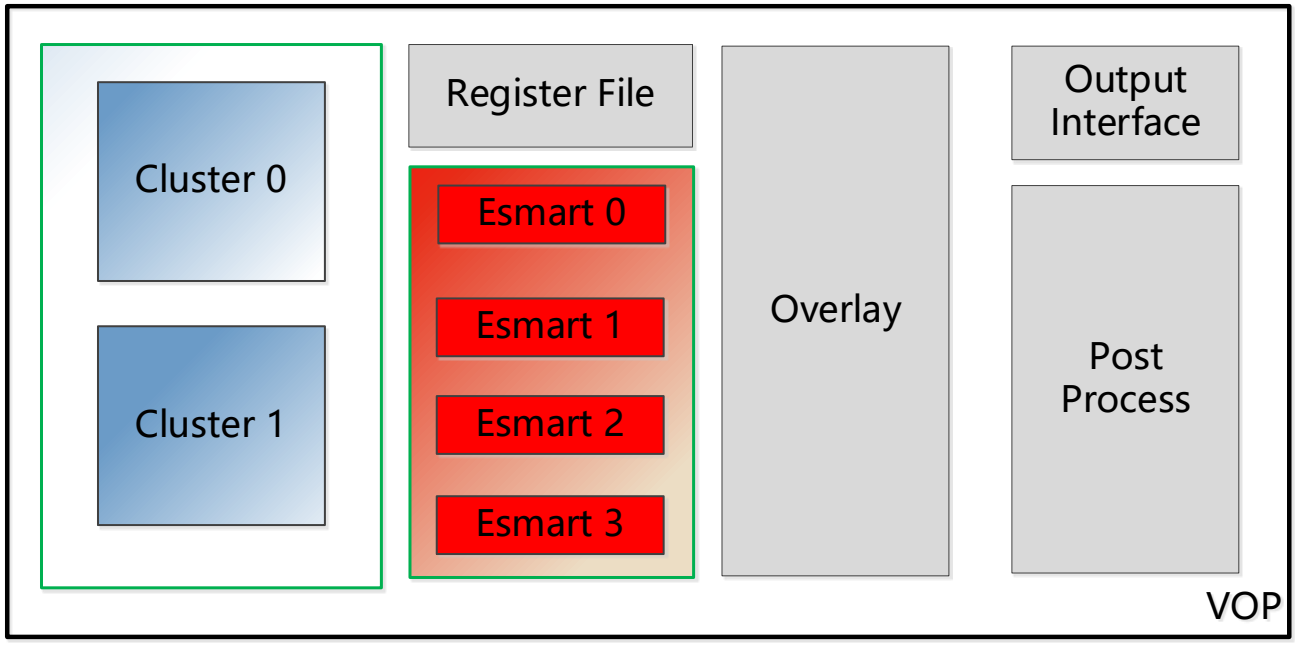

Fig. 11-6 Power Domains Structure Diagram of VOP

The cluster PD domain has 2 layers. The esmart layer 0/1/2/3 share one power domain. It is recommended that only static switches are used according to the application scenario.

11.3.8 Function Memory Chain Switch Description

Since the power domain cannot achieve the functional level power switch, in some application scenarios, when a memory function does not need to be dynamically turned on, the power supply of the memory chain can be turned off, which can reduce the power consumption as much as possible. It is divided into eight memory chains of WB, Post Process Module 0/1/2.

The register address is as follows:

- PMU_SUBMEM_PWR_GATE_SFTCON1
- PMU_SUBMEM_PWR_GATE_SFTCON2

The bit allocation of memory chain is as follows:

- #define MID_VOPPOST0 (1<<15)
- #define MID_VOPPOST1 (1<<16)
- #define MID_VOPPOST2 (1<<17)
- #define MID_VOPWB (1<<22)

11.3.9 Security Program Description

11.3.9.1 SoC Connection Diagram

(1) The switch of the security layer and the selection of the security port controlled by register vop_sec_drm_ctrl(SYS_SGRF_SOC_CON1[10:0]).

Copyright © 2024 Rockchip Electronics Co., Ltd.

(2) Support a certain address segment (security layer address segment) of the AHB slave can be designated as a secure address on the interconnect;
(3) The bus supports MMU bypass logic according to the layer's ID.

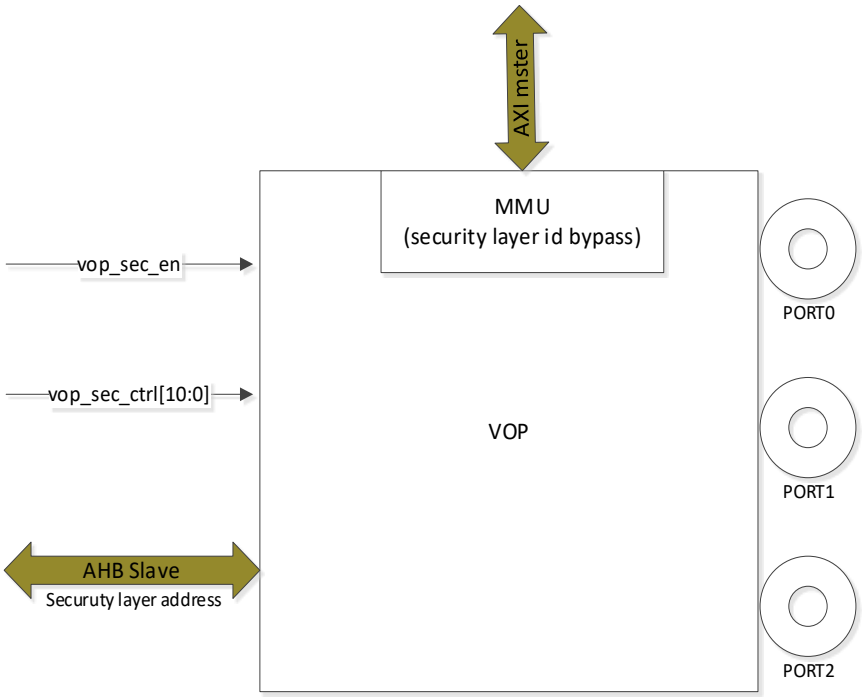

Fig. 11-7 security schematic block diagram

11.3.9.2 Hardware Security Implementation

(1) The following points shall be guaranteed:
1) The secure layer shall only be selected to the corresponding secure PORT;
2) The secure mode write back function shall be disabled;
3) In the system, DDR can be configured to only allow access to devices with security attributes on the bus;
(2) The layer address segment will not be accessed by non-secure CPU;
The address space corresponding to esmart0 is defined as a secure address, and the specific address is as follows:

0x27D01800 ~ 0x27D018ff

(3) MMU bypass logic ensures that the MMU page table will not be tampered with and accessed to other addresses;
vop_sec_ctrl[10:0] is added to the VOP interface, the specific description is as follows.

Table 11-1 Description of security-related registers

SGRF	bits	description
vop_sec_en	1	1'b0: Non-secure mode 1'b1: Secure mode
vop_sec_port	2	2'b00: Video PORT0 2'b01: Video PORT1 2'b10: Video PORT2
vop_wb_dis	1	1'b0: Normal 1'b1: Disable WB function
vop_post_dis	1	1'b0: Normal 1'b1: Disable Post process
vop_nonsec_black	1	1'b0: Normal 1'b1: Non-sec PORT display black
vop_drm_en	1	1. The security layer esmart0 is forced to vop_sec_port (check) 2. When secure PORT_mux=4'h8 (no layer) , it is forced to be equal to 4'h1, and other PORTs are forced to have no

Copyright © 2024 Rockchip Electronics Co., Ltd.

SGRF	bits	description
		layer, which means the value is 4'h8 3. When the non-secure PORT conflicts with the PORT_mux of the secure PORT, force the non-secure PORT mux=4'h8 (check) 4. Force the security layer to be at the top of the security PORT (check) 5. When a secure layer is selected for non-secure PORT, the layer is forcibly closed (check) 6. Alpha operation after turning off the security layer (check) 7. The sys_dsp_inface_en is not configurable

11.3.9.3 Security Scene

1. Secure payment:

- Esmart0 is a secure payment layer and support to specify a secure PORT. With vop_sec_en enable.
- Vop_sec_port selects secure PORT.
- Vop_wb_dis can disable the write-back function.
- Vop_post_dis can turn off non-secure PORT.
- Vop_nonsec_black can make non-secure PORT black screen.
- Vop_drm_en is forcibly sent to secure layer security payment enable. The layer is placed on top of the secure PORT.
- The alpha operation of the secure layer is turned off.

2. Drm

VOP uses 0x1e0~0x1ff as the secure slave address segment, which is used to configure drm related operations.

- Content to layer security

Support to set whether the layer is secure, and set whether to initiate secure access according to the rid.

- Content to PORT security

PORT_x with a secure layer can be set, the secure layer can only be sent to the designated secure PORT_x, otherwise the layer will be forcibly closed.

11.3.9.4 Secure Mode Entry and Exit Process

It is recommended that driver performs the layer transfer in secure mode and normal mode.

Copyright © 2024 Rockchip Electronics Co., Ltd.

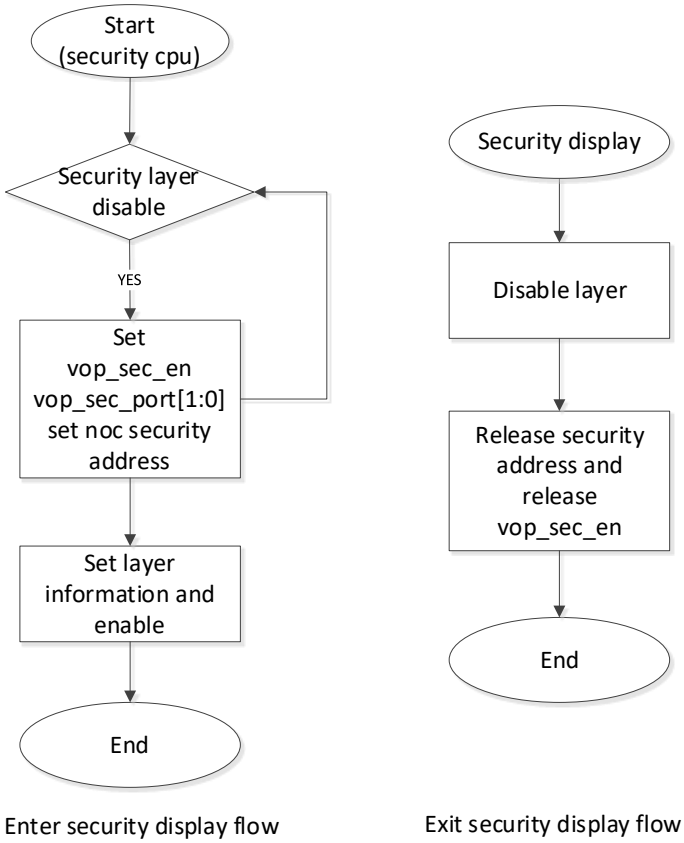

Fig. 11-8 secure mode entry and exit diagram

11.3.9.5 DDR Frequency Conversion Instructions

1. dma_finish interrupt source

This interrupt is connected to DCF and DCF can handle frequency conversion.

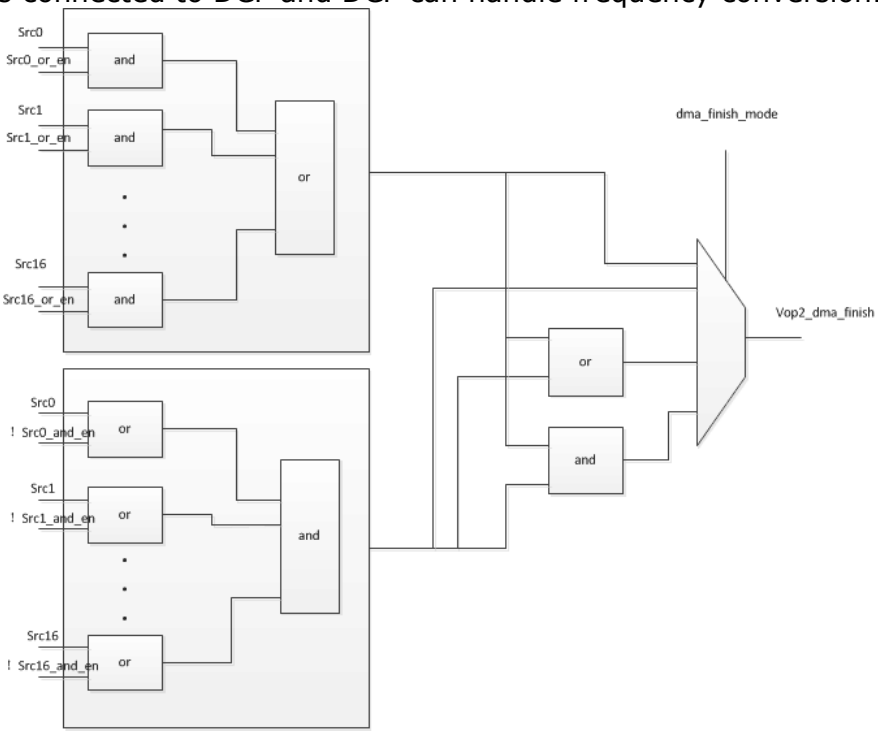

Fig. 11-9 DMA finish interrupt structure diagram

The source of dma_finish is as follows, and the logic from win almost full, vp line flag, dsp hold and almost full is combined and output.

Table 11-2 dma finish interrupt source description

source list	name	remark
dma_finish	src0	AXI0_dma_finish &AXI1_dma_finish
wb_dma_finish	src1	WB DMA finish detected
vp0_line_flag	src2	When port0 line count equals the configured line flag number
vp1_line_flag	src3	When port1 line count equals the configured line flag number
vp0_dsp_hold	src6	Port0 hold status detected
vp1_dsp_hold	src7	Port1 hold status detected
vp0_almost_full	src10	When port0 post line buffer number equals dsp_almost_full_thold
vp1_almost_full	src11	When port1 post line buffer number equals dsp_almost_full_thold

2. VOP_INTR_DDR

The VOP_INTR_DDR signal comes from dma_finish, which is connected to the system interrupt controller through an interrupt signal, and the frequency can be converted through the interrupt, which is consistent with the DCF function.

3. VOP_INTR_lb

Set the waterline of the post line buffer, and realize real-time frequency conversion through the status of line buffer, which can provide about 20us for frequency conversion.

11.4 Function Description

11.4.1 Cluster Layer

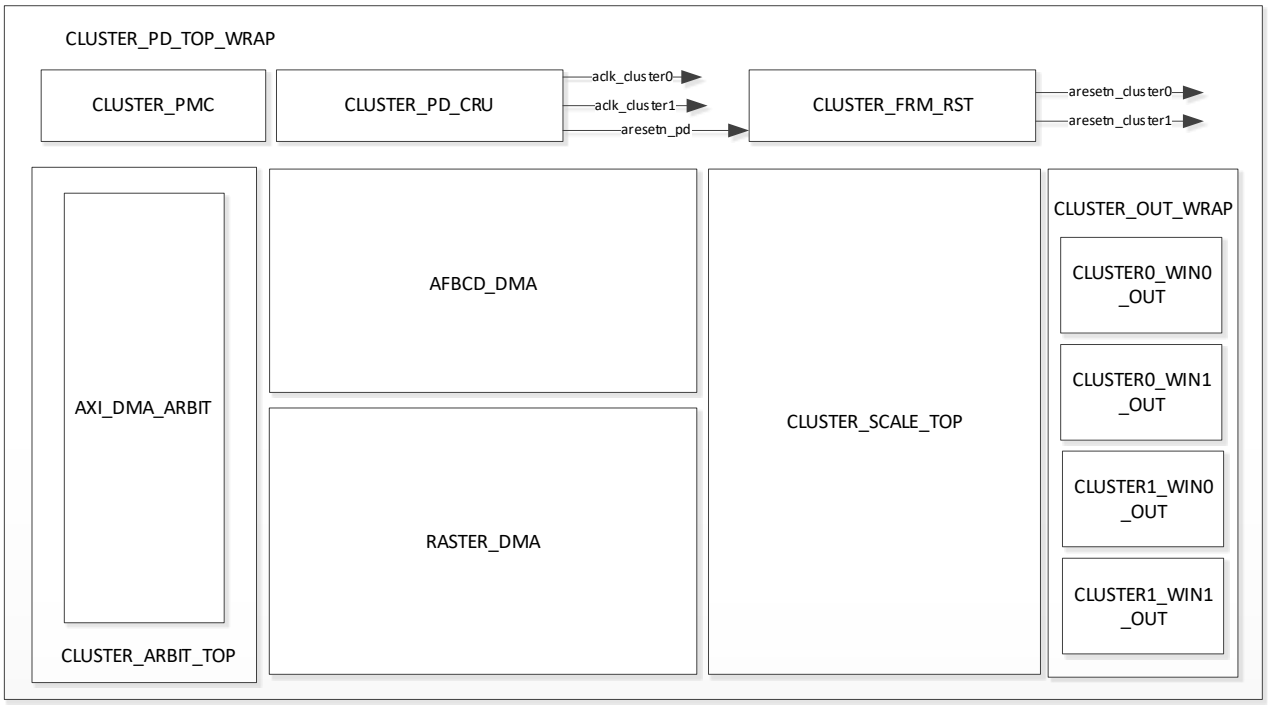

Fig. 11-10 VOP cluster block diagram

11.4.1.1 Basic Feature

- Support FBCD compression mode
- Support raster and tile mode
- Support color gamut space conversion
- Support 1/8~8 times scale
- Support mirror
- Support DCI

Copyright © 2024 Rockchip Electronics Co., Ltd.

- Support image virtual width

11.4.1.2 Support format description

- **RFBCD format**

When format is RFBCD, half mode and block_split must be set 0.

Parameter RFBCD_RGB565 =4'b0000
Parameter RFBCD_RGBA1010102 =4'b0010
Parameter RFBCD_RGB888 =4'b0100
Parameter RFBCD_RGBA8888 =4'b0101
Parameter RFBCD_YUV420_8b =4'b1001
Parameter RFBCD_YUV420_10b =4'b0011
Parameter RFBCD_YUV422_8b =4'b1011
Parameter RFBCD_YUV422_10b =4'b1110
Parameter RFBCD_YUV444_8b =4'b0100
Parameter RFBCD_YUV444_10b =4'b0010

- **AFBCD format**

When format is AFBCD, half mode and block_split must be set 1.

Parameter AFBCD_RGB565 =4'b0000
Parameter AFBCD_RGBA1010102 =4'b0010
Parameter AFBCD_RGB888 =4'b0100
Parameter AFBCD_RGBA8888 =4'b0101

- **AFBCD transform format**

When format is AFBCD, half mode and block_split must be set 1, color transform must be set 1.

Parameter AFBCD_RGB888 =4'b0100
Parameter AFBCD_RGBA8888 =4'b0101

- **TILE4x4 format**

When format is Tile model0, win_tile_mode_sel set 1 and fbcd_en set 0.

Parameter Tile4x4_YCbCr444_888 = 5'b01110
Parameter Tile4x4_YCbCr422_888 = 5'b01101
Parameter Tile4x4_YCbCr420_888 = 5'b01100
Parameter Tile4x4_YCbCr444_101010 = 5'b11110
Parameter Tile4x4_YCbCr422_101010 = 5'b11101
Parameter Tile4x4_YCbCr420_101010 = 5'b11100

When format is Tile model1, win_tile_mode_sel and fbcd_en must be set 0.

Parameter Tile4x4_YCbCr444_888 = 5'b01110
Parameter Tile4x4_YCbCr422_888 = 5'b01101
Parameter Tile4x4_YCbCr420_888 = 5'b01100
Parameter Tile4x4_YCbCr400_888 = 5'b01111
Parameter Tile4x4_YCbCr444_101010 = 5'b11110
Parameter Tile4x4_YCbCr422_101010 = 5'b11101
Parameter Tile4x4_YCbCr420_101010 = 5'b11100
Parameter Tile4x4_YCbCr400_101010 = 5'b11111

- **RASTER format**

Parameter ARGB8888 = 5b00000
Parameter RGB888 = 5'b01110
Parameter RGB565 = 5'b01101
Parameter RGBA1010102 = 5'b01100
Parameter YCbCr444_888 = 5'b01111
Parameter YCbCr422_888 = 5'b11110
Parameter YCbCr420_888 = 5'b11101
Parameter YCbCr400_888 = 5'b11100
Parameter YCbCr444_101010 = 5'b01111
Parameter YCbCr422_101010 = 5'b11110
Parameter YCbCr420_101010 = 5'b11101
Parameter YCbCr400_101010 = 5'b11100

Note: YUV444i format is uster RGB888 channel for data stranforamt.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Note: The format needs to be written into the format register configuration related to FBCD. There is no one-to-one correspondence between the format and the format of the layer, and the driver needs to do a mapping.

11.4.1.3 Support line buffer mode description

Cluster line buffer supports the following three modes:
(1) Single window mode (lb mode = 2'b00): In this mode, he maximum resolution supports single 4096 pixels width layer output and layer input.

(2) Two windows mode (lb mode = 2'b01): In this mode, the cluster allows up to 2x2048 pixels width layers to be enabled and the two windows would be mixed firstly before send into overlay.

11.4.1.4 FBCD description

VOP support AFBCD and RFBCD.

AFBCD is a 32*8 based encoding method, AFBCD_SPLIT is a 32*4 based encoding method;

RFBCD is a 64*4 based encoding method;

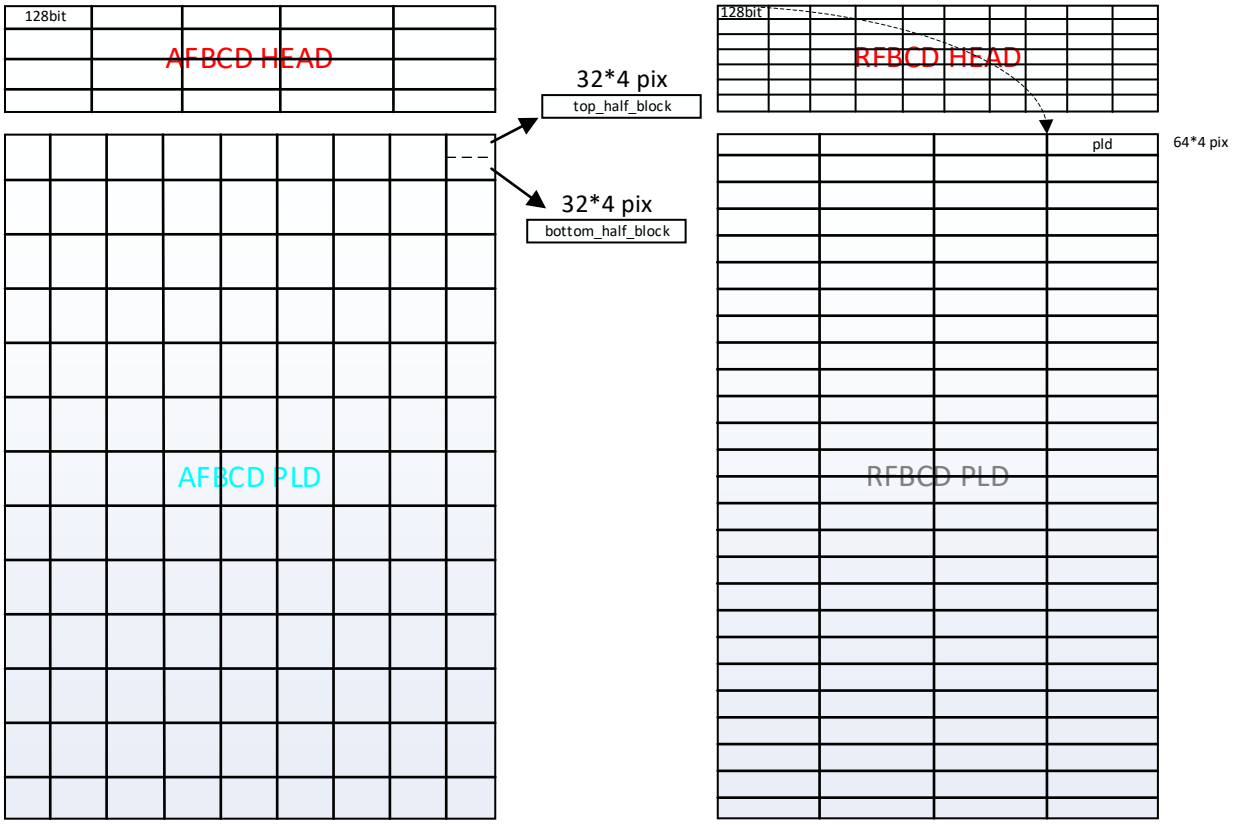

Fig. 11-11 Diagram of AFBCD_SPLIT (left) and RFBCD (right)

11.4.1.5 Scale

- Scale up:

In the horizontal direction: Bilinear, Best-neigh and Multi-phase filter
Horizontal scale up factor:

$$\text{factor} = ((\text{act_width} * 2 - 3) << 15)/(\text{dsp_widht} - 1)$$

In the vertical direction: Bilinear, Best-neigh and Multi-phase filter
Vertical scale up factor:

$$\text{factor} = ((\text{act_height} * 2 - 3) << 15)/(\text{dsp_height} - 1)$$

- Horizontal Scale Down:

When horizontal scale down up to 1/4~1:
In the horizontal direction: Bilinear, best-neigh and Multi-phase filter.

  - Horizontal scale down factor:

$$\text{factor} = ((\text{act_width} * 2 - 3) << 11)/(\text{dsp_width} - 1)$$

When scale down up to 1/8~1/4: Must be use 2 Level-Scale

Copyright © 2024 Rockchip Electronics Co., Ltd.

- First use xavg2 or xgt2 scale down up to 1/4 In horizontal direction
- In the horizontal direction continue to implement the remaining scaling using the following algorithm: bilinear, best-neigh, Multi-phase filter.

- Vertical Scale Down:

When vertical scale down, use Bilinear and best-neigh

- Scale dn up to 1/8~1
- Vertical scale down factor:

$$\text{factor} = ((\text{act_height} * 2 - 3) << 11)/(\text{dsp_height} - 1)$$

  - When scale down to 1/4~1/2: Must be use 2 Level-Scale to enable ygt2 or yavg2
  - When scale down up 1/4: Must be use 2 Level-Scale to enable ygt4 or yavg4
- In the horizontal direction continue to implement the remaining scaling using the following algorithm: bilinear, best-neigh.

When vertical scale down, use Multi-phase filter

- scale dn up to 1/8~1
- Vertical scale down factor:

$$\text{factor} = ((\text{act_height} * 2 - 3) << 11)/(\text{dsp_height} - 1)$$

- When scale down up to 1/8~1/4: Must be use 2 Level-Scale: ygt2 or yavg2

Note: Format is line don't support yavg.

Note: Cluster0/1 have four layers, sharing scale line buff of 8k, The allocation of line buff to layers is automatically assigned by the layer's enablement.

11.4.1.6 Mirror

In FBCD mode, cluster supports X-mirror, Y-mirror, X-mirror plus Y-mirror (equivalent to rotation180°) .

Note: VOP don't support rotation in this version.

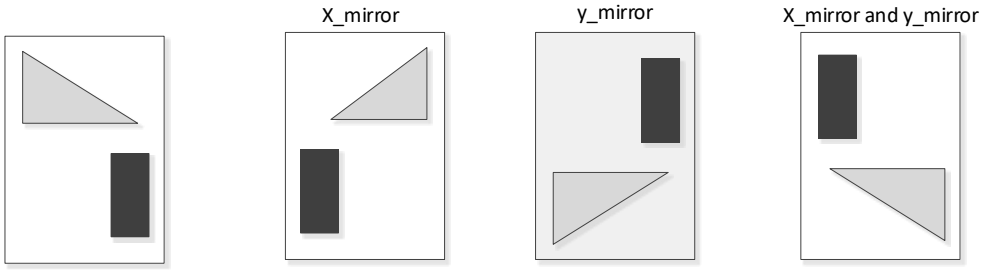

Fig. 11-12 Schematic diagram of mirror

11.4.1.7 Crop

Due to the characteristics of Android, the UI stored in the DDR is often an image larger than the actual display, so it is necessary to cut out a small image from the original image to display.

For VOP, only the following key parameters are required:

(1) Picture base ddr address

(2) Virtual stride

(3) Act_width/act_height

(4) Act_x_offset/act_y_offset

Copyright © 2024 Rockchip Electronics Co., Ltd.

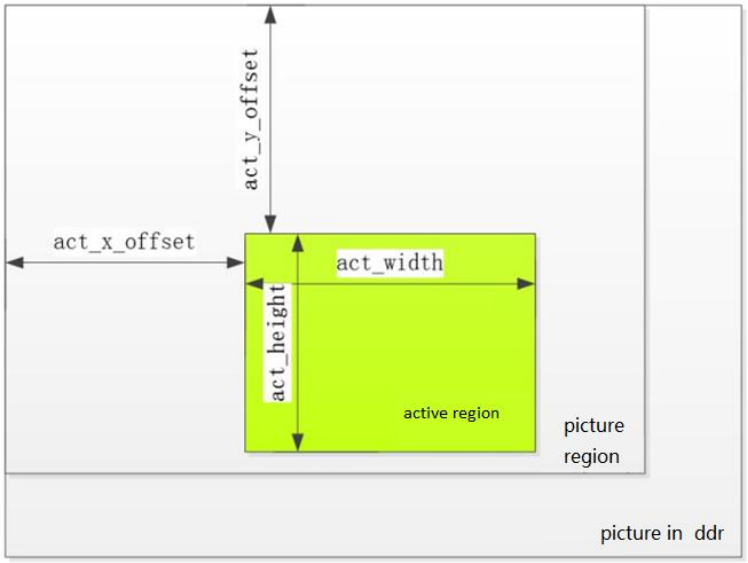

Fig. 11-13 Image storage and activation diagram

11.4.1.8 CSC module description

Support yuv2rgb, rgb2yuv color gamut space conversion, you can select the corresponding csc according to the input image format and the spatial gamut of the overlay.

RGB2YUV supports the following modes:
Parameter BT_601_L = 2'b00;
Parameter BT_709 = 2'b01;
Parameter BT_601_F = 2'b10;
Parameter BT_2020 = 2'b11;

YUV2RGB supports the following modes:
Parameter BT_601_L = 3'b000;
Parameter BT_709 = 3'b001;
Parameter BT_601_F = 3'b010;
Parameter BT_2020 = 3'b011;
Parameter BT_709_L_13 = 3'b100;
Parameter BT_709_F_13 = 3'b101;
Parameter BT_2020_L_13 = 3'b110;
Parameter BT_2020_F_13 = 3'b111;

Note: Only cluster_win0 layers support CSC 13bit model in YUV2RGB.

11.4.1.9 DCI

This module realizes dynamic picture adjustment of picture brightness and contrast by loading the statistical information of the front module (VDPP) to make the picture appear more transparent. At present, the DCI module is mainly divided into histogram processing module, curve fitting module, BBHE dual histogram equalization module, BS black level expansion module, chromaticity adjustment module, and local contrast enhancement CLAHE module.

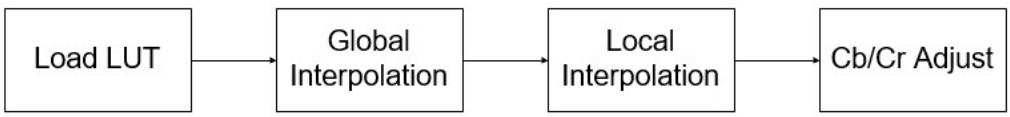

Fig. 11-14 Functional structure diagram of DCI module

*When DCI input is RGB format, use must be set csc_out_path_sel to 1'b1.

11.4.1.10 Cluster Usage Constraints

1. Line does not support X mirroring and Tile mode does not support X/Y mirroring.

Copyright © 2024 Rockchip Electronics Co., Ltd.

2. All pic format don't supported in the rotation mode.
3. In two win mode, the half mode bit should be set to 1.
4. Scaling ratio: (1/8~8) //TODO
5. In the case of LB two win mode, (act_width+act_xoffset%16) <= 2048.
6. When enable the win*_yrgb_vsd_gt4, the win*_act_yoffset should be 4 pixels aliged.
7. When enable the win*_yrgb_vsd_gt2, the win*_act_yoffset should be 2 pixels aliged.
8. When the data format is YUV420, the win*_act_xoffset and win*_act_yoffset should be 2 pixels aliged.
9. When the data format is YUV422, the win*_act_xoffset should be 2 pixels aliged.
10. In raster model, the data format is YUV444_10bit/YUV422_10bit/YUV420_10bit with act_xoffset should be 4 pixels aliged.
11. In raster model, the data format is YUV420_10bit/YUV422_10bit with act_width should be 2 pixels aliged.
12. In raster model, the data format is YUV420_10bit with act_height and act_yoffset should be 2 pixels aliged.
13. When the layer is in FBCD or tile format, and foramt = YUV420_8bit (10bit) , win*_*act_xoffset win*_act_yoffset should be 2 pixels aliged.
14. When the layer is in FBCD or tile format, and foramt = YUV422_8bit (10bit) , win*_act_xoffset should be 2 pixels aliged.
15. CLUSTER0/1_WIN0 layer support 13-bit Y2R.
16. Only CLUSTER0_WIN0 support DCI function.
17. In fbcd overlap mode, pld data 128-bit alignment is required.
18. In two win mode, it is strictly required that the two layers must be in the same mode state, such as fbcd/raster/tile, and mixed use is not allowed. Moreover, multiple color gamuts are not supported in the same mode.

11.4.2 Esmart layer

11.4.2.1 Schematic diagram of esmart

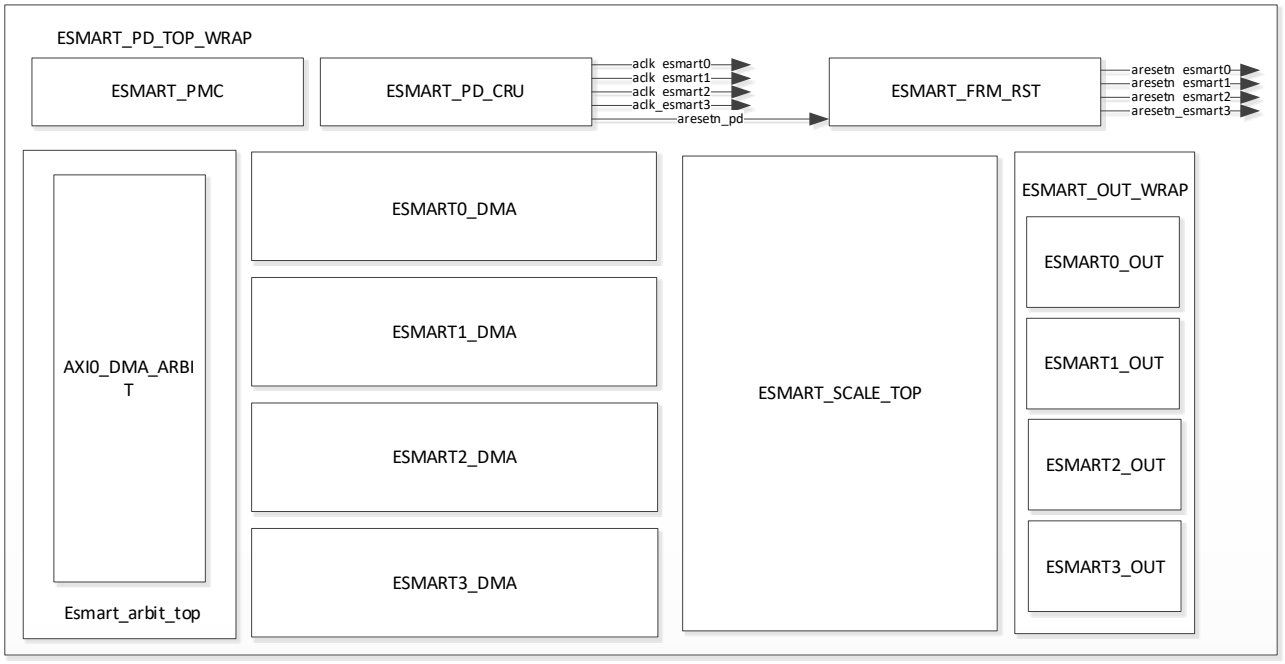

Fig. 11-15 VOP esmart block diagram

11.4.2.2 Layer

1. Feature

- Support raster mode
- Support color gamut space conversion
- Support 4 region display
- Support 1/8~8 times infinite scale
- Support image virtual width
- Support y_mirror

Copyright © 2024 Rockchip Electronics Co., Ltd.

2. Basic bus
The bus behavior of the esmart layer is to take one line of buffers when one line is free. It cannot be taken in two lines at a time like the 8 lines of the cluster layer. Basically, each line has a part of time for bus access. The power consumption of DDR is also not very friendly.

3. Power consumption description
The logical power consumption of the smart layer is smaller than that of the cluster layer, but because the cluster has FBCD modules, plus the power consumption of the DDR controller and phy, the overall power consumption of the smart layer is much larger than the overall power consumption of the cluster layer.
It is recommended to use FBCD as much as possible for those FBCD application, and esmart layer may be used in multi-region features.

11.4.2.3 Format

Table 11-3 Swap configuration table in esmart default format

esmart		
Format	**rb_swap**	**uv_swap**
ARGB	1	0
RGB888	1	0
RGB565	0	0
RGBA101010A2	1	0
YUV420	0	1
YUV422	0	1
YUV444	0	1
YUV400	0	0
YVYU422	0	1
VYUY422	0	1
YUV420_10bit	0	1
YUV422_10bit	0	1
YUV444_10bit	0	1
YUV400_10bit	0	0

11.4.2.4 CSC

Esmart support yuv2rgb, rgb2yuv color gamut space conversion, you can select the corresponding csc according to the input image format and the spatial gamut of the overlay.

RGB2YUV supports the following modes (csc_mode[1:0]):

```
Parameter BT_601_L    = 2'b00;
Parameter BT_709      = 2'b01;
Parameter BT_601_F    = 2'b10;
Parameter BT_2020     = 2'b11;
```

YUV2RGB supports the following modes (csc_mode[1:0]):

```
Parameter BT_601_L    = 2'b00;
Parameter BT_709      = 2'b01;
Parameter BT_601_F    = 2'b10;
Parameter BT_2020     = 2'b11;
```

Note: Only esmart0 layer support yuv2rgb 13bit model.
when esmart_yuv2rgb_13bit_en set 1.csc_mode[1:0] define change to following:

Copyright © 2024 Rockchip Electronics Co., Ltd.

```
Parameter BT_709_L_13    = 2'b00;
Parameter BT_709_F_13    = 2'b01;
Parameter BT_2020_L_13   = 2'b10;
Parameter BT_2020_F_13   = 2'b11;
```

11.4.2.5 Scale

Horizontal direction algorithm:

- Scl up: Best-neigh/bilinear/bicubic
- Scl dn: Best-neigh/bilinear (support 2 Level-Scale)

Vertical direction algorithm:

- Scl up: Best-neigh/bilinear/bicubic
- Scl dn: Best-neigh/bilinear

Sample:2 level-scale sample:A picture with a width of 400 and a height of 400 is scaled to a picture with a width of 150 and a height of 400 by vop:

1. Act_width = src_width (400) - 1; act_height = src_height (400) - 1; write act_width to DSP_INFO[15:0]. write act_height to DSP_INFO[31:16].
2. Dsp_width=dst_width (150) - 1;dsp_height=dst_height (400) - 1;write dsp_width to DSP _INFO[15:0]. write dsp_height to DSP_INFO[31:16].
3. Set regionx_xpre_scl_mode (REGIONx_MST_CTL[23:22]) = 2'b00.
4. Enable xavg_en (REGIONx_MST_CTL[20]) or xgr_en (REGIONx_MST_CTL[21]) .
5. After the 1 level-scale, act_width becomes 200.
6. Calculate the scale_factor width 200 to 150, set regionx_yrgb_xfactor (REGIONx_SCL _FACTOR_YGB[15:0]) = scale_factor.
7. Enable regionx_xsd_en (REGIONx_SCL_CTRL[1]) .

11.4.2.6 ESMART LB_MODE

Esmart0/1/2/3 share 8k line buff :

- Esmart lb_mode = 2'b10: Support three layers display up to 4k pixels.
- Esmart lb_mode = 2'b11: Support two layers display up to 2k pixels and two layers display up to 4k pixels.

11.4.2.7 Usage Constraints

1. Layer don't support the YUYV420/UYVY420 format.
2. Layer requires the act_width and act_xoffset of YUV422/YUV420 to be 2 pixels aligned.
3. Layer requires the act_width and act_xoffset of YUV444_10bit/YUV422_10bit/ YUV420_10bit/YUV400_10bit to be 4 pixels aligned.
4. Layer requires the act_height and act_yoffset of YUV420/YUV420_10bit to be 2 pixels aligned.
5. Layer don't support rotation and x-mirror.
6. Multiple regions within a layer cannot have spatial intersections in the Y direction.
7. ARGB5551 and RGB565 share a format_type (FMT_RGB565), and are distinguished by the sw_fmt_argb1555 (REGIONx_MST_CTRL_BIT7) bit.
8. If esmart_ygt2 (ygt4) enable, act_yoffset should be 2 (4) pixels aligned.
9. If esmart_xgt2 (xgt4) enable, act_xoffset should be 2 (4) pixels aligned.
10. Only esmart0_layer support y2r_13bit.

Copyright © 2024 Rockchip Electronics Co., Ltd.

11.4.3 Overlay

11.4.3.1 Schematic diagram of layer data path

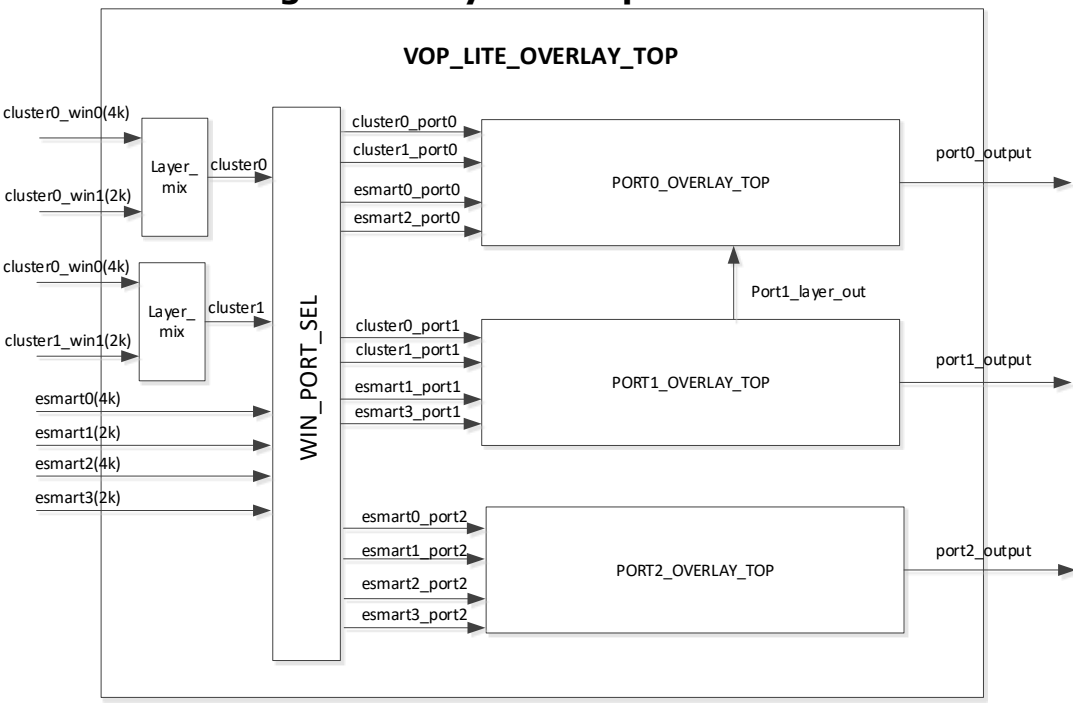

Fig. 11-16 VOP overlay block diagram

11.4.3.2 Delay setting of each function

As shown in the figure above, in the new overlay architecture. all post are output from the last stage of mux, so the value of each vp should be a fixed delay_num, and its default value is shown in the following table. Typical settings are as follows.

Table 11-4 Default table of layer delay number

Block	Delay_num
Esmart layer	0
Cluster layer	0
The delay of the port0 last mux output	20
The delay of the port1 last mux output	16

11.4.3.3 Alpha module

If there is no alpha processing, it is a direct coverage effect. Therefore, it is necessary to do an alpha effect on the corresponding layer or the corresponding position to achieve the superposition of the UI and the background or video. Most of them are aimed at the RGB data with alpha output by the GPU, such as RGBA8888; or the global alpha of the layer is configured inside the VOP to realize the special effect of superimposing between the layers. The following picture shows the basic alpha overlay effect:

Copyright © 2024 Rockchip Electronics Co., Ltd.

Fig. 11-17 Schematic diagram of alpha effect

1. Per-pixel Alpha

Per-pixel alpha, as the name implies, is that each point has corresponding alpha information. As shown in the picture above, the alpha value of each point in Jordan's picture increases from 0 to 255 in cycles from left to right, and the effect gradually changes from fully transparent to impermeable.

2. Global Alpha

The global alpha has nothing to do with the original data. You can set the alpha value of the entire layer separately. As shown in the figure above, the little bee layer is a global alpha effect, and the transparency of the entire layer is the same.

3. Pre-mult Alpha

Pre-multiplied alpha means that in the process of GPU operation, the original data and alpha have been multiplied accordingly, and there is no need to multiply alpha by its own RGB value during subsequent superposition.

The modes of Alpha are shown in the figure below:

Copyright © 2024 Rockchip Electronics Co., Ltd.

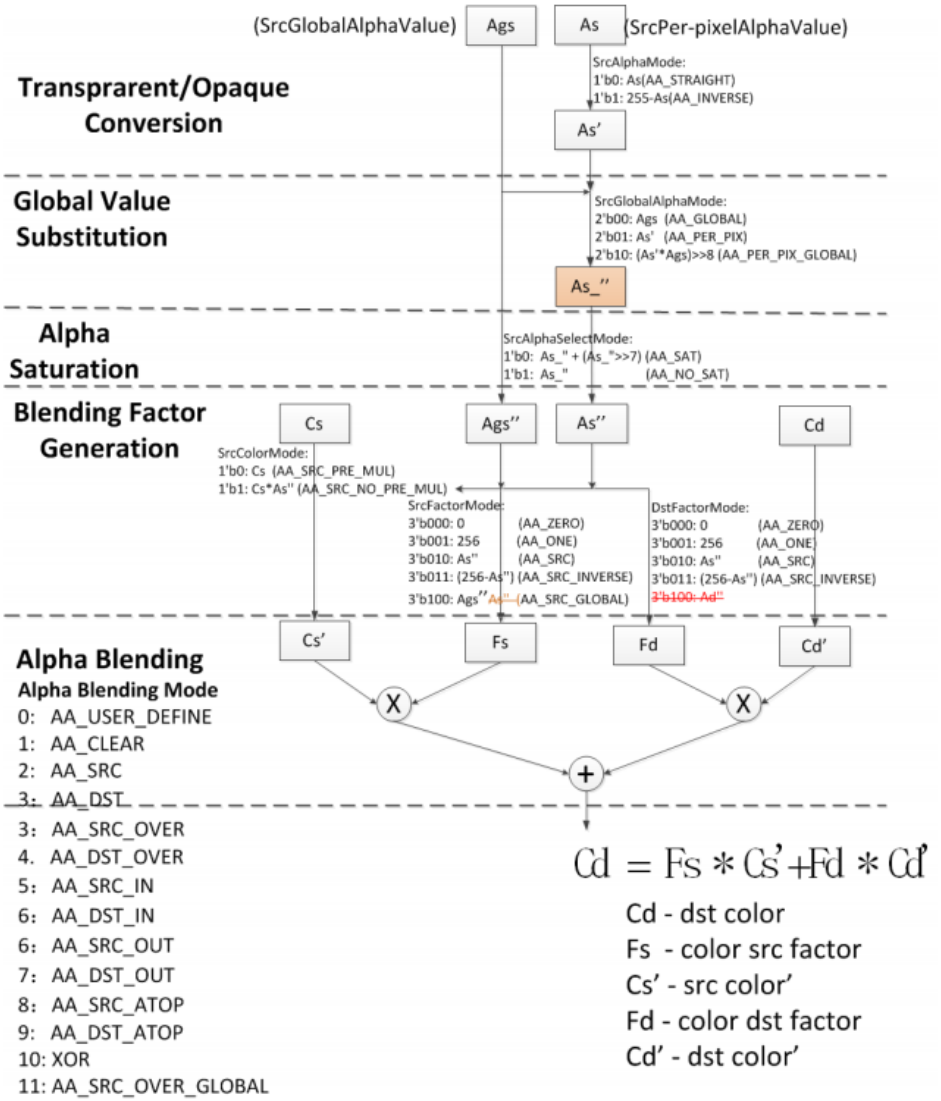

Fig. 11-18 alpha structure diagram

11.4.3.4 Secure Mode

The secure mode hardware will put the secure layer on the top layer of the selected PORT. For details, please refer to the description of 1.3.9 secure scheme.

11.4.3.5 Usage Constraints

(1) When the layer is switched by bus, the layer shall be disabled.
(2) When the post is switching mix, all the layers involved shall be disabled.

11.4.4 HDR

11.4.4.1 Feature

- Support 10-Bit data input and output
- Support 4K input and 4K output
- Support HDR VIVID
- Support HDR10
- Support HLG
- Support metadata

Note: Don't support PQHDR2HLG and HDRvivid receiver adaptation mode.

11.4.4.2 HDR overlay

For SDR2HDR scenes, the overlay process.

Copyright © 2024 Rockchip Electronics Co., Ltd.

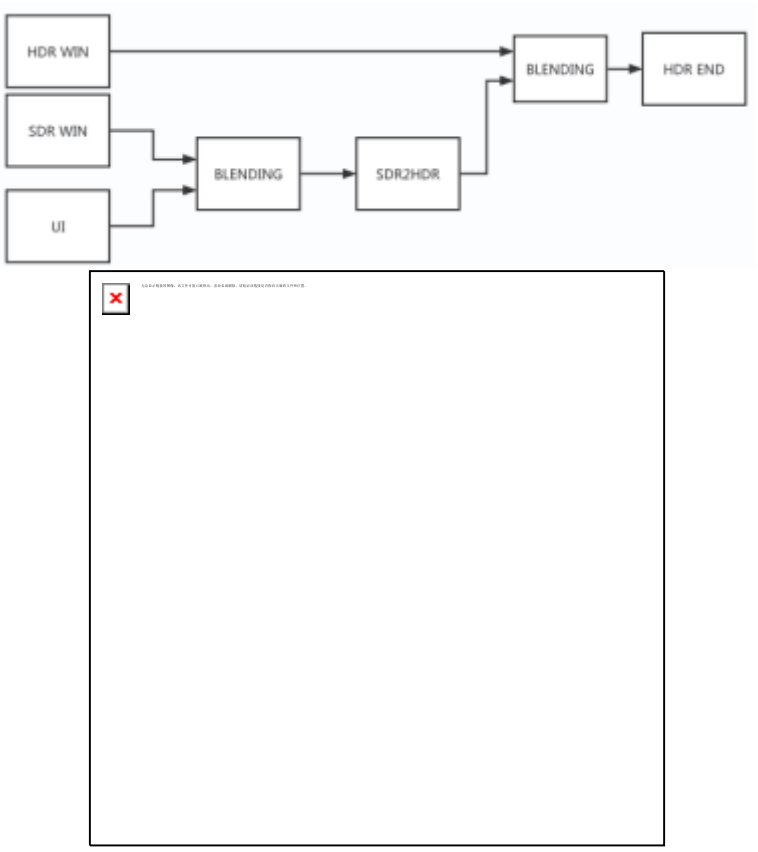

Fig. 11-19 SDR2HDR process

For HDR2SDR scenes, the overlay process.

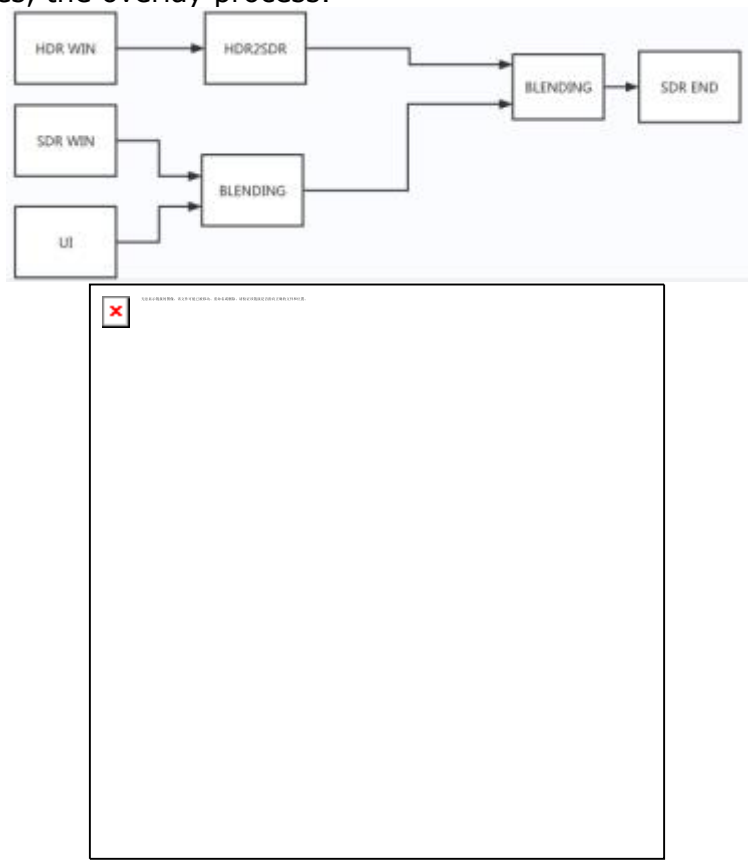

Fig. 11-20 HDR2SDR process

11.4.4.3 HDR mode delay set

Both HDR VIVID and SDR2HDR are under the overlay module. To enable the module or select different modes to work, you need to configure different delay values.

For the HDR vivid channel, there are a total of 8 modes, of which mode7 is a mode compatible with HDR10. The design is the same as mode1. The only difference is the configuration of

Copyright © 2024 Rockchip Electronics Co., Ltd.

curves and parameters. For the SDR2HDR/HLG path, there are a total of 2 modes. The details are as follows, including the delay of each mode

Table 11-5 HDR mode and SDR delay num

		Function model	delay
HDR VIVID	mode 0	PQHDR2HDR with Dynamic Meta	17
	mode 1	PQHDR2SDR with Dynamic Meta	29
	mode 2	HLG2PQHDR with Dynamic Meta	32
	mode 3	HLG2SDR with Dynamic Meta	44
	mode 4	HLG2PQHDR without Dynamic Meta	15
	mode 5	HLG2SDR without Dynamic Meta	38
	mode 6	HDR bypass	1
	mode 7	HDR10	29
SDR2HDR/HLG	SDR2HDR	SDR2HDR	21
	SDR2HLG	SDR2HLG	21

11.4.4.4 HDR configure

To enable HDR2SDR or SDR2HDR, the enable signal on overlay and the enable signal inside HDR2SDR or SDR2HDR must be turned on at the same time.

1. Overlay mode: Bit0 of OVERLAY_PORT0 0x0600 is set to 0 for overlay RGB mode.
2. HDR2SDR:

Bit4 of OVERLAY_PORT0 0x0600 is set to 1.
Bit0 of HDR 0x2040 is set to 1.

3. SDR2HDR:

Bit5 of OVERLAY_PORT0 0x0600 is set to 1.
Bit0 of HDR 0x2010 is set to 1.

4. Immediately effective registers: Ink related registers (0x2080 to 0x2088), lookup table configuration (0x213c to 0x29fc).
5. Frame valid register: except Ink and lookup table.

- **Lut updata**

Except for HDR vivid channel mode 0 to 3, tone and sca need to be updated every frame, and other tables can be configured once at the beginning. Configure registers directly through AHB.

Updates to tone and sca tables are divided into two modes.

1. **AHB**

The advantage of configuring the register directly through AHB is that it is easy to debug if it is not dynamically updated.

The dynamic update process is as follows.

Initialize the configuration
Detect that the frame_end interrupt is valid, and start the update of the next frame table

2. **AXI**

You don't need to configure so many registers, and directly AXI goes to the corresponding address of DDR to fetch the number. Tables for tone and sca only.

Need to configure hdr_lut_update_en=1, hdr_lut_mode=1 of hdr_lut_ctrl. Hdr_lut_mst is configured as the fetch address, and the frame takes effect. Hdr_lut_fetch_done indicates that the current table has been fetched.

11.4.5 Write Back

11.4.5.1 Support format

1. Support format

- ARGB888

Copyright © 2024 Rockchip Electronics Co., Ltd.

- RGB888
- RGB565
- YUV420

2. Color gamut conversion

Since the main application scenario output is RGB, but there is a need for YUV420 write-back, the write-back module adds RGB2YUV format conversion, which is enabled by configuring wb_rgb2yuv_en register bit.

11.4.5.2 Single frame/multi frame mode

(1) Single frame mode

Operating in single frame mode, enable the oneframe_clr register, and automatically disable wb_en after each frame is written, so that only one frame of content will be written out.

(2) Multi-frame mode

Each frame is configured with a different address, and the wb module will continuously write out the corresponding whole frame content.

11.4.5.3 Water line

By caching the data that needs to be written to a certain amount before starting the write output, this can improve the efficiency of data bus usage. The position of the write-back watermark varies for different write-back formats, and the formula is as follows:

$$fifo_thold = wb_width * fmt_byte/16$$

Among them, frm_byte represents the byte number of a pix in the write-back format, wb_ width indicates the output width of the write-back.

11.4.5.4 Horizontal scaling

The bilinear scaling algorithm is used in the horizontal direction.

11.4.5.5 Vertical stroke

Due to the limitation of memory, there is not enough linebuffer opened separately, so no scaling is done in the y direction. If more than twice, wb_ythrow_en is configured to control the line-throwing operation to reduce the output bandwidth.

11.4.5.6 Write back virtual stride

In this design, the virtual stride of the write-back and a separate enable switch have been added. Achieve more flexible write-back length

11.4.5.7 Usage Constraints

(1) In the case of YUV domain output, the conversion of YUV2RGB is not supported, that is, RGB format cannot be written back under YUV domain.
(2) Act_in write-back mode The width is no longer required to be an integer multiple of 16. Without the virtual width function enabled, the write-back does not require 16 pixelske alignment, but the write-back data will be automatically aligned to 16 bytes.

11.4.6 Post process

Function of each PORT 0/1/2 and the post-processing modules included in each PORT.

11.4.6.1 DSP_BLANK

When DSP_OUT_BLANK enabled, VSYNC/HSYNC/DATAEN and DATA signals are all cleared to zero.

11.4.6.2 DSP_OUT_ZERO

When DSP_OUT_ZERO enabled, the VSYNC/HSYNC/DATAEN signal is pulled low, and DATA_BUS is output normally.

11.4.6.3 DSP_BLACK

When DSP_BLACK enabled, the timing-related scan timing will be output normally, and data will be 0 on the data bus.

11.4.6.4 Color bar

Each PORT has a corresponding color bar setting, which can be used to debug to eliminate

Copyright © 2024 Rockchip Electronics Co., Ltd.

bus and layer problems, and it can also bypass the layer to directly adjust each high-speed output interface.
Control register color_bar_en to enable colorbar of PORT;
Control register color_bar_mode to switch horizontal colorbar or vertical colorbar.

11.4.6.5 Dither

If an 8bit film source needs to be output to the rgb666 screen, if there is no dither, it is directly connected to the screen with a high 6bit. In this case, the color gradation will be caused.

In principle, the smooth curve becomes a ladder after losing the low position. In order to solve this problem, noise is added to the ladder, so that the transition can restore the original smooth curve as much as possible.

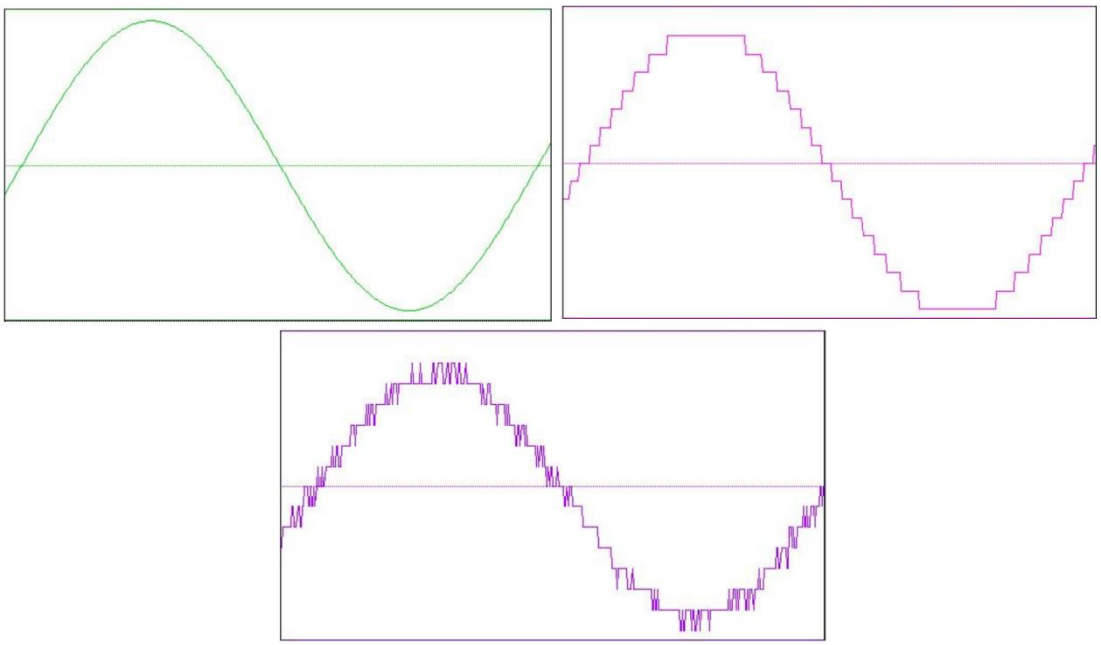

Fig. 11-21 Schematic diagram of dither principle

VOP has ALG in the dither algorithm of 10bit->8bit; there are ALG and FRC in the dither algorithm for 8bit->666/565, which can be selected by dither_down_mode.

ALG algorithm: Add fixed noise, the possible negative effect is that there will be more regular stripes similar to tire tracks;

FRC algorithm: time-domain jitter is added to the space, which works well in high frame rate scenes, and low frame rate scenes may feel a little flickering and jittery.
FRC2.0 algorithm:The Dither Noise Pattern based on 8 continuous frames in time domain, with units of pixels in the form of 16*16 in spatial domain, and YUV-differentiated color channels, is used to add random noise to the original image to achieve color dithering and reduce contouring. The random noise used is varying in the temporal domain and the noise model used is also more complex. It may be a random noise pattern generated based on some characteristics of the human visual system (such as OTF) and the construction of specific spatial filters (VP0/1 support).

Copyright © 2024 Rockchip Electronics Co., Ltd.

Fig. 11-22 dither effect diagram
Left: original picture; right: direct clip effect

The above picture shows the color scale effect of the original picture and the direct clip. The figure below is the figure processed by the dither algorithm. The overall effect is obvious to solve the color gradation problem caused by dither, but after partial magnification, the tire-like effect on the right side of the figure below will appear.

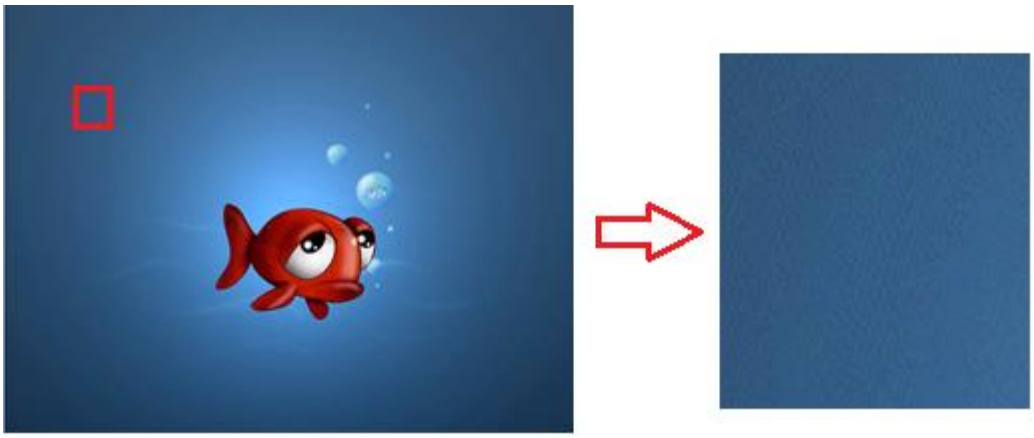

Fig. 11-23 Schematic diagram of dither's tire pattern

Note1: The dither-frc's correlation coefficient control system provides default values when it is powered up.
Note2: FRC2.0 don't support 8bit or 10bit dither down 6bit.
Note3: Post2 don't support pre_dither_down.

11.4.6.6 BCSH

BCSH mainly adjusts the following effects:
(1) CON: Contrast coefficient
(2) BRT: Bright picture adjustment value
(3) HUE: Hue adjustment angle
(4) SAT: Saturation coefficient

Y processing calculation formula

$Y_0 = Y_{input}-16$; (0<Y0<239)
$Y_1 = Y_0*CON$; (0<CON<1.992) (0<Y1<478)
$Y_2 = Y_1+BRT$; (-32<BRT<31) (-32<Y2<509)
$Y_3 = Y_2+16$; (-16<Y3<525)
Y_{output} = 4 MUX 1;

U processing calculation formula

$U_0 = U_{input}-128$; (-128, 127)
$U_1 = U_0*\cos(HUE) + V0*\sin(HUE)$; ($-30^o$<HUE<$30^o$) (-175, 174)
$U_2 = U_1*CON*SAT$; (0<CON<1.992, 0<SAT<1.992) (-695, 691)
$U_3 = U_2+128$; (-567, 819)
U_{output} = 4 MUX 1;
Cos(HUE)+sin(HUE) = (1+1/2*sin(2HUE))1/2;
So this value increases monotonically with the increase of the value of HUE. The value range of HUE is -30 ~0° .

Copyright © 2024 Rockchip Electronics Co., Ltd.

V processing calculation formula

$V_0 = V_{input}-128$; (-128, 127)

$V_1 = V_0*\cos(HUE) - U0*\sin(HUE)$; ($-30^o<HUE<30^o$)(-175, 174)

$V_2 = V_1*CON*SAT$; ($0<CON<1.992$, $0<SAT<1.992$) (-695, 691)

$V_3 = V_2+128$; (-567, 819)

V_{output}= 4 MUX 1;

$\cos(HUE)-\sin(HUE) = (1+1/2*\sin(-2HUE))^{1/2}$.

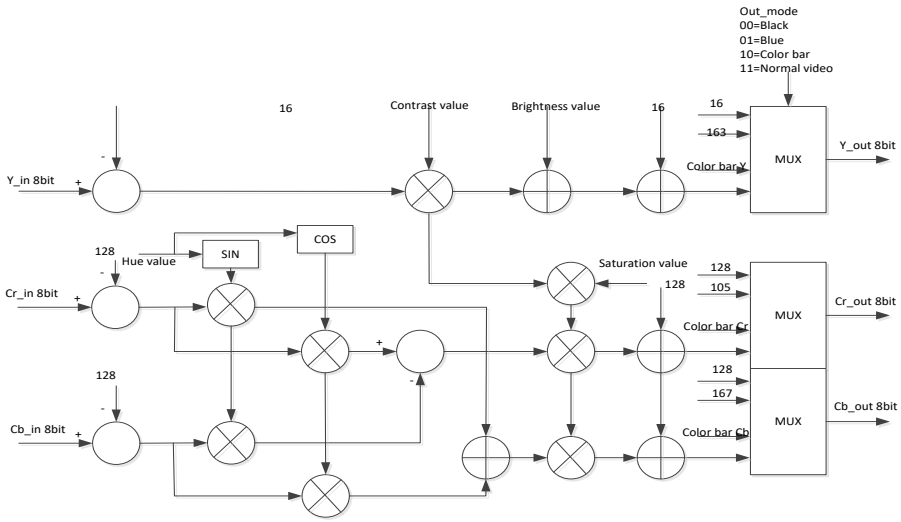

Fig. 11-24 Schematic diagram of BCSH algorithm

11.4.6.7 Gamma

Gamma basic principle:

Gamma can be understood as a 1:1 remapping of the RGB on the display channel. The three RGB curves can be consistent or inconsistent. Therefore, the display color temperature and blue light removal effects can be adjusted through the mapping relationship of the three curves.

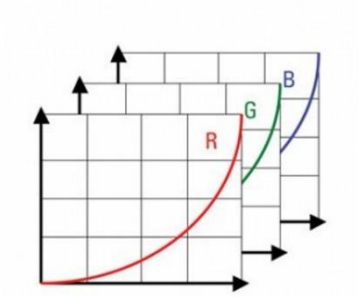

Fig. 11-25 Schematic of gamma

Dual gamma:

Because the application may adjust the gamma curve to achieve dynamic adjustment of some color temperature effects. However, the memory of the gamma table is a single-port memory. When a new table is written, it is necessary to disable gamma, which will cause screen flicker when dynamically adjusting the gamma curve.

In order to solve this flicker phenomenon, VOP adopts the ping-pong dual gamma. By statically switching gamma, one table is displayed and used in real time, and the other table is a new table that can be configured.

Note: post0/post1 gamma is 10 bit, post2 gamma is 8 bit.

11.4.6.8 ACM

ACM module, the full name of automatic color management module (auto color management), this module mainly adjusts the color of the picture by adjusting the brightness, hue and saturation to obtain a better picture with rich colors. Adjustment, more in line with the preferences of the human eye. The color correction of this module uses the three dimensions of Hue, Saturation and Brightness Value to adjust the color in the HSV system at the same

Copyright © 2024 Rockchip Electronics Co., Ltd.

time to achieve color correction and enhancement.
The current adjustment is mainly to convert the input YUV signal to YHS space first, adjust the color, and then convert it back to YUV space.
The ACM module is mainly divided into three components, YHS, to be adjusted respectively. Taking the adjustment interface of a certain component as an example, as shown in the figure above, the ACM module needs to adjust the delta table and two Gain tables.

- Y parameter adjustment

The delta value of the Y signal is mainly adjusted according to the Hue component. Up is to increase the brightness of the color, and down is to reduce the brightness of the color. The larger the value, the larger the adjustment amount.
This part is mainly at a certain Hue sampling point, and the corresponding gain value is adjusted according to the size of the saturation at this point. The larger the corresponding gain value, the larger the final adjustment change.
At a certain Hue sampling point, the corresponding gain value is adjusted according to the size of the corresponding brightness at that point. Similarly, the larger the corresponding gain value, the greater the final brightness adjustment change.
Y final change calculation:
Assuming that at the sampling point H of a certain Hue, the adjustment amount of Y by Hue is, the gain value of Y by Saturation is the gain value of Y by Y, and the final change amount of the brightness Y of this sampling point is the value of

$$\Delta Y_H = Delta_{YH} \cdot Gain_{YS} \cdot Gain_{YY}$$

- Hue parameter adjustment

The corresponding delta value is mainly adjusted according to the Hue component. The adjustment of the table is shown in the figure. The degree is increased upwards. After the degree is increased, the color will be shifted to the right. The greater the increase, the more colors that deviate. Down is to reduce the degree. After the degree is reduced, the color will be shifted to the left. The greater the increase, the more colors will be deviated. Take this picture as an example, adjust at the blue point, increase the degree, it will deviate in the direction of red, and decrease the degree, it will deviate in the direction of green.
Hue By Saturation can be more finely adjusted for a certain Hue sampling point according to the saturation, and the saturation of the place is searched for the gain value of the corresponding Saturation in the order from small to large. The larger the value is, the final Hue change also bigger.
At a certain Hue sampling point, the corresponding gain value is adjusted according to the size of the corresponding brightness Y. The larger the corresponding gain value, the larger the final Hue adjustment change.
Hue final change calculation:
Assuming that the adjustment amount of Hue by Hue at the sampling point H of a certain Hue is, the adjustment amount of Hue by Saturation is, and the adjustment amount of Hue by Y is, then the final change amount of chroma Hue of this sampling point is

$$\Delta H_H = Delta_{HH} \cdot Gain_{HS} \cdot Gain_{HY}$$

- Saturation parameter adjustment

The adjustment of Saturation adjusts the delta value according to the color position of the Hue point. If the point goes up, it increases the saturation, and if it goes down, it decreases the saturation.
Saturation By Saturation can be more finely adjusted according to the saturation of a certain Hue sampling point, and the saturation of the place is searched for the gain value of the corresponding Saturation in the order from small to large. The larger the value, the change amount of the final Saturation also bigger. Usually the change of saturation has a great influence on the result, so the gain value here needs to be finely adjusted.
At a certain Hue sampling point, the corresponding gain value is adjusted according to the size of the brightness Y at the sampling point. The larger the corresponding gain value, the larger the final Saturation adjustment change.
Saturation final change calculation:
Assuming that the adjustment amount of Saturation by Hue at the sampling point H of a certain Hue is, the gain value of Saturation by Saturation and the gain value of Saturation by Y, then the final change amount of Saturation of this sampling point is

Copyright © 2024 Rockchip Electronics Co., Ltd.

$$\Delta S_H = Delta_{SH} \cdot Gain_{SS} \cdot Gain_{SY}$$

Sample:

Taking Saturation adjustment as an example, currently, a 2D lookup table of Saturation by Saturation based on Hue sampling points and a 2D lookup table of Saturation by Y based on Hue sampling points are mainly generated according to the corresponding gain value table. As shown in the figure below, assuming the value of the input YHS signal is (Y, H, S), according to the value of the saturation S and the chroma H of the input point E1, look up the 2D lookup table of Saturation by Saturation, and find the corresponding four in the table. A sampling point A1, B1, C1, D1 and its corresponding gain value (**Gain$_{SS}$**), the gain value of E1 point is calculated by bilinear interpolation method

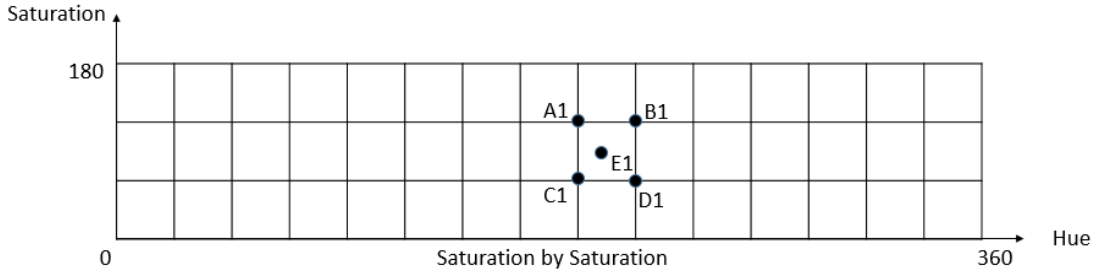

Fig. 11-26 Schematic of 2-D interpolation for Gainss

Similarly, the gain (**Gain$_{ST}$**) value at point E2 is calculated by bilinear interpolation by looking up the 2D lookup table of Saturation by Y.

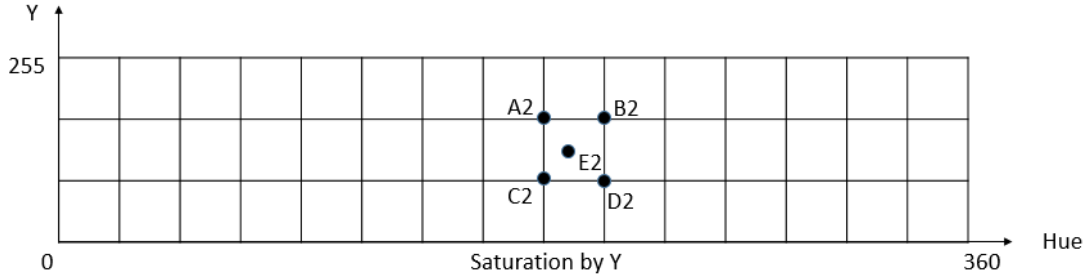

Fig. 11-27 Schematic of 2-D interpolation for Gainsy

Finally, according to the value of H, the corresponding value is linearly interpolated through the one-dimensional table of Saturation by Hue. As shown in the figure below, the delta value (Delta$_{SH}$) at E3 is linearly interpolated according to the gain values at points A3 and B3.

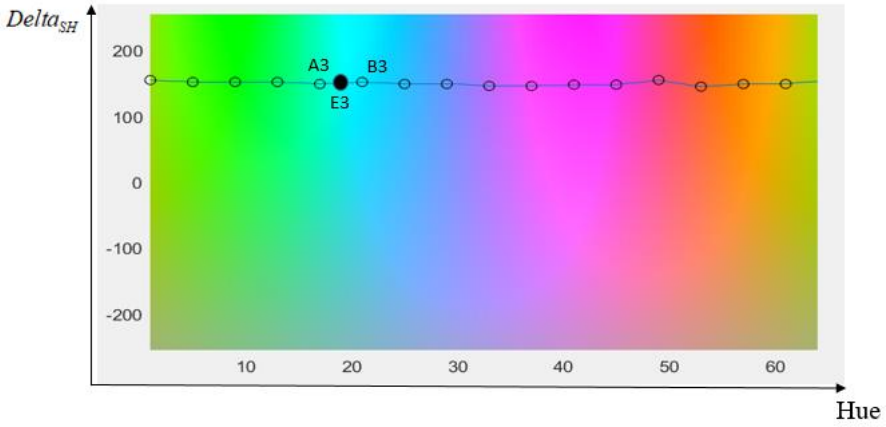

Fig. 11-28 Schematic of 2-D interpolation for Deltash

Therefore, when the value of the input YHS signal is (Y, H, S), the final value of the saturation change of the sampling point is the value of

$$\Delta S_H = Delta_{SH} \cdot Gain_{SS} \cdot Gain_{SY}$$

The calculation of the corresponding final changes of Hue and Y signals is similar to the above calculation process, that is, each YHS signal needs to look up the 2D table twice and the one-dimensional linear table once, and calculate the gain after cubic interpolation respectively. Finally, the respective changes of YHS are added to the input signal to obtain the output YHS

Copyright © 2024 Rockchip Electronics Co., Ltd.

signal (Y_o, H_o, S_o)

$$Y_o = \Delta Y_H + Y$$
$$H_o = \Delta H_H + H$$
$$S_o = \Delta S_H + S$$

The formula for converting YUV signal (YCbCr) to YHS signal is as follows:

$$S = \sqrt{Cr^2 + Cb^2}$$
$$H = \tan^{-1}\frac{Cr}{Cb}$$

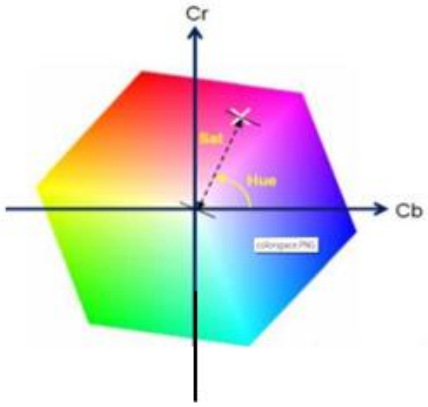

Fig. 11-29 Schematic of transform between Cb, Cr and Hue, Sat

The saturation S can be regarded as the modulo length of the Cb and Cr signals, and the chromaticity Hue can be regarded as the angle between the vector represented by the Cb and Cr signals and the horizontal axis. Similarly, the formula for converting YHS signal to YUV signal (YCbCr) is as follows:

$$Cb = S \cdot \cos H$$
$$Cr = S \cdot \sin H$$

11.4.6.9 3D LUT

Gamma can be regarded as a 1D LUT. The RGB data in the 1D LUT are independent of each other, which means that the 1D LUT can only control the gamma value, RGB balance (gray scale) and white point. In order to overcome the limitation of 1D LUT, we can form a 3×3 matrix of three 1D LUTs of RGB to control the color saturation and brightness, and perform linear scaling in the complete color space. The 3D LUT can affect the hue, saturation, brightness, etc. in a full three-dimensional color space control method.

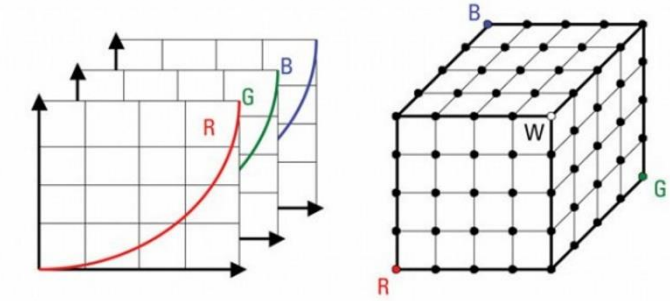

Fig. 11-30 Schematic diagram of 2D/3D-LUT

3D LUT application scenarios:

(1) Calibration (calibration LUT)

It is mainly used for the calibration of hardware and display equipment in color management. The video will be processed by different systems during the shooting, post-processing and final projection, and will appear in different forms. Therefore, the 3D LUT color space mapping can ensure that the video remains visually consistent in different systems.

(2) Technology (Technical LUT)

It is mostly used for conversion under different characteristic curves in different color

Copyright © 2024 Rockchip Electronics Co., Ltd.

spaces. Mapping from Log to Rec709 belongs to this type. The color standards of computer monitors, televisions, mobile phones, and Pads that we come into contact with in work and life are very close to Rec.709. However, now a large number of cameras and even SLRs can shoot log (Log) video. If the log video is sent to the Rec.709 standard monitor for monitoring, it cannot be restored normally. The fundamental reason is that the gamma difference between the two is very large, so it needs to be artificially corrected to the display system gamma.

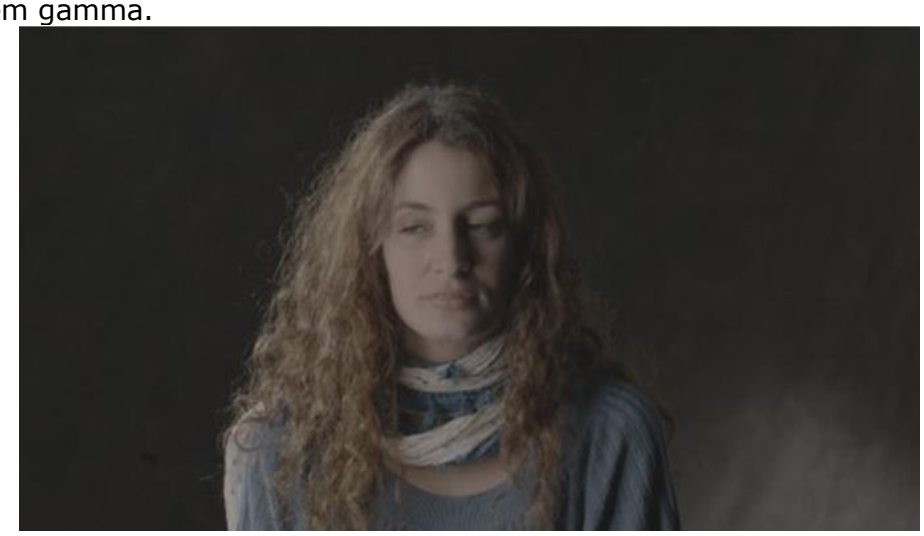

Fig. 11-31 Effect picture before correction

Fig. 11-32 Effect picture after correction

(3) Style (Creative LUT/Looks LUT)

In order to realize a certain style of LUT, the LUT produced by the director of photography during the pre-shooting and can be previewed on-site. Using LUT to calibrate the color of the monitor does not creatively process the video. Another type of use of LUT is to color, that is, creatively process the video.

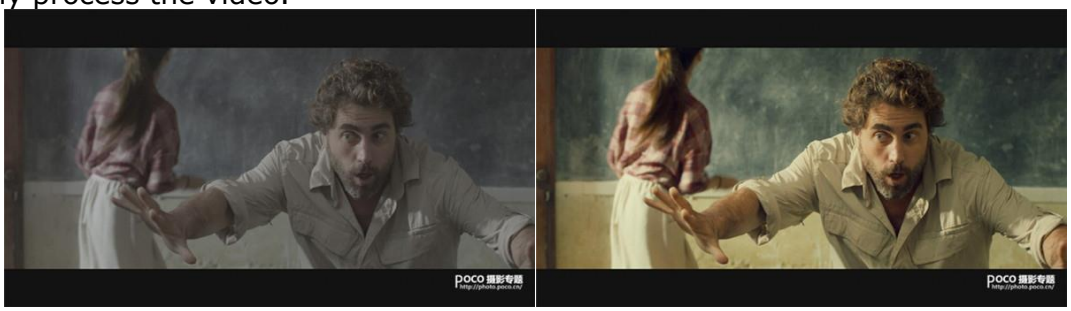

Fig. 11-33 Effect picture before and after toning

Comparison of 3D LUT before (left) and after (right) toning

Application and configuration

In the application, user can adjust the required scene effects through the 3D LUT Creator software and save the 3D LUT table configuration corresponding to 9x9x9 or 17x17x17 to

the address corresponding to the VOP.

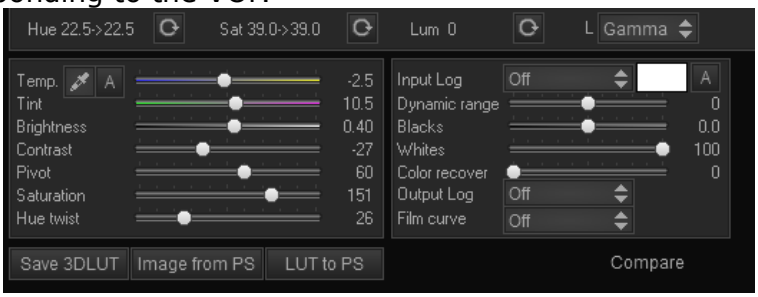

Fig. 11-34 Basic operation interface of 3D LUT Creator

For example, for a 9x9x9 LUT table, a 729-point constant needs to be written to the corresponding memory, which can be written through AXI or AHB. The arrangement is as follows:

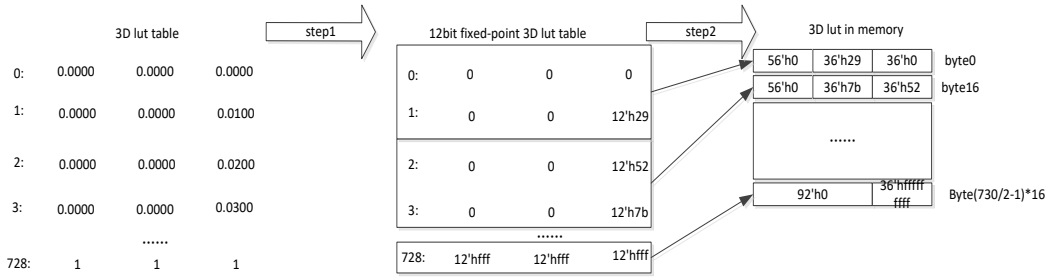

Fig. 11-35 3D LUT table sorting diagram

Note: Only port0 support 3dlut.

11.4.6.10 SHARP

The main function of this system is to enhance image details and support configuring different strengths of gain for details of different scales and directions. The strength of detail enhancement can be controlled based on the image content, including local gradients, brightness, and variance information. Additionally, it supports controlling the strength of detail enhancement for different color channels of the input.

Note:

1. Only post0 support sharp.
2. Sharp and post scale can not be used at the same time.
3. Sharp and post split can not be used at the same time.

11.4.6.11 Timing description

A. Progressive timing configuration

The POST*_PROC registers need to configure:

- VOP_DSP_HTOTAL_HS_END
- VOP_DSP_HACT_ST_END
- VOP_DSP_VTOTAL_VS_END
- VOP_DSP_VACT_ST_END

B. p timing chart example

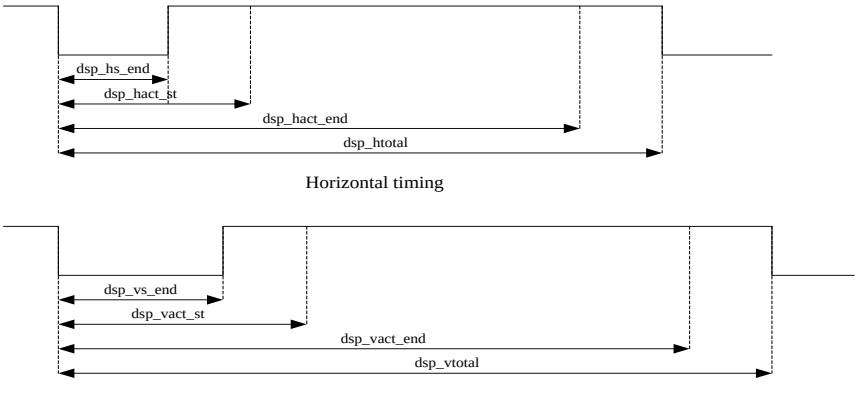

Fig. 11-36 VOP RGB interface timing diagram (progressive mode)

Copyright © 2024 Rockchip Electronics Co., Ltd.

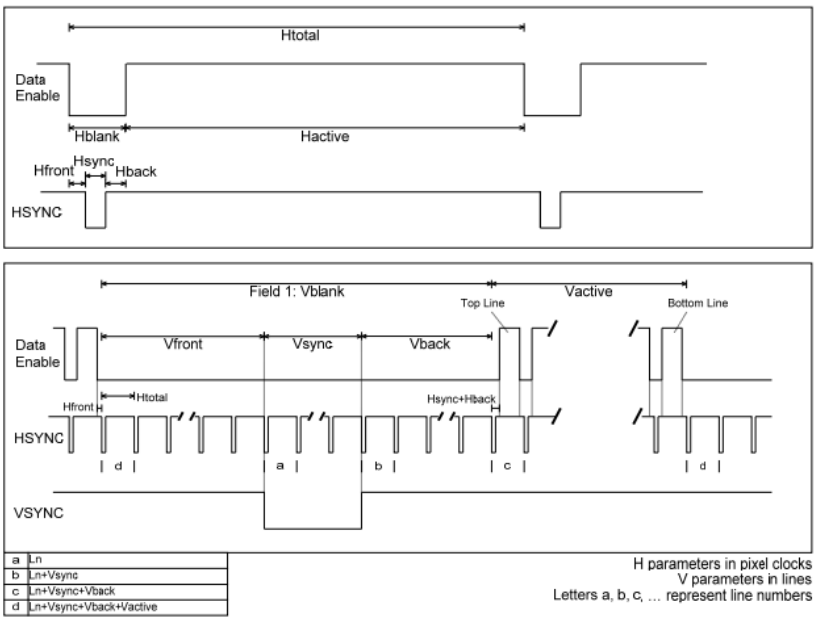

Fig. 11-37 CTA-861 standard timing diagram (progressive mode)

C. Interlace timing configuration

Need to configure the following timing registers:

- VOP_DSP_HTOTAL_HS_END
- VOP_DSP_HACT_ST_END
- VOP_DSP_VTOTAL_VS_END
- VOP_DSP_VACT_ST_END
- VOP_DSP_VS_ST_END_F1
- VOP_DSP_VACT_ST_END_F1

D. i timing chart example

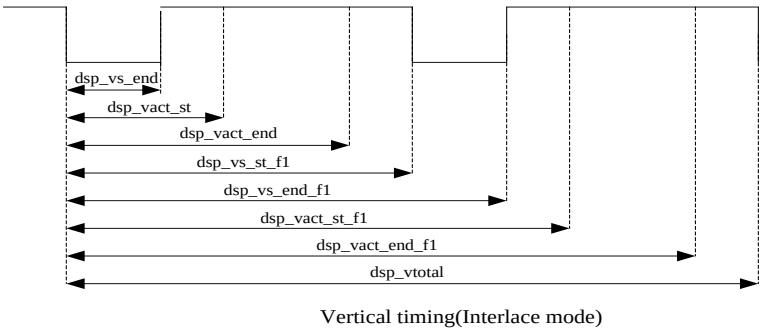

Fig. 11-38 VOP RGB interface timing diagram (interlace mode)

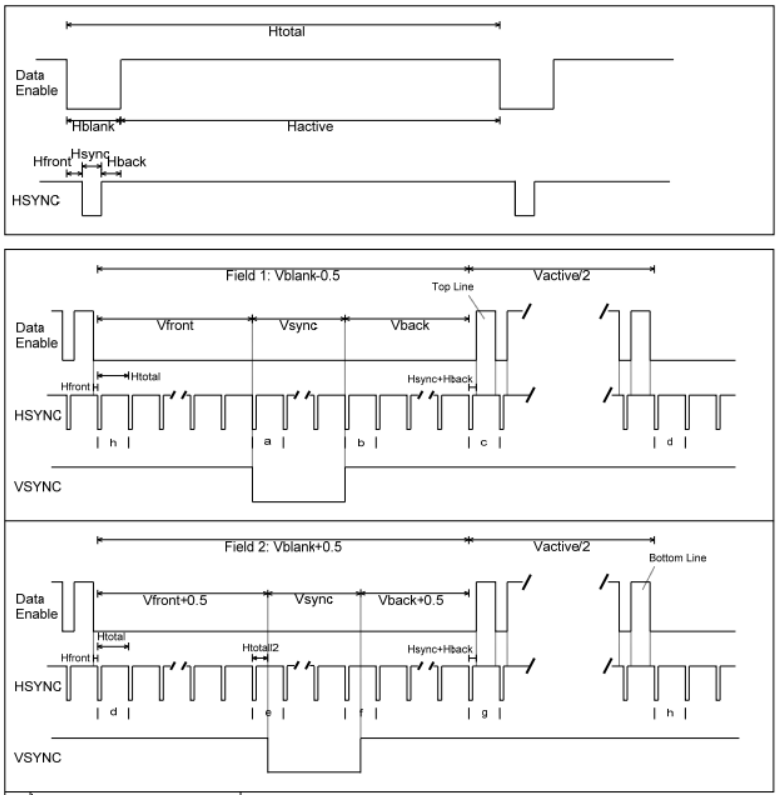
Points to note, the starting point of the second field is at 1/2 of htotal.

Copyright © 2024 Rockchip Electronics Co., Ltd.



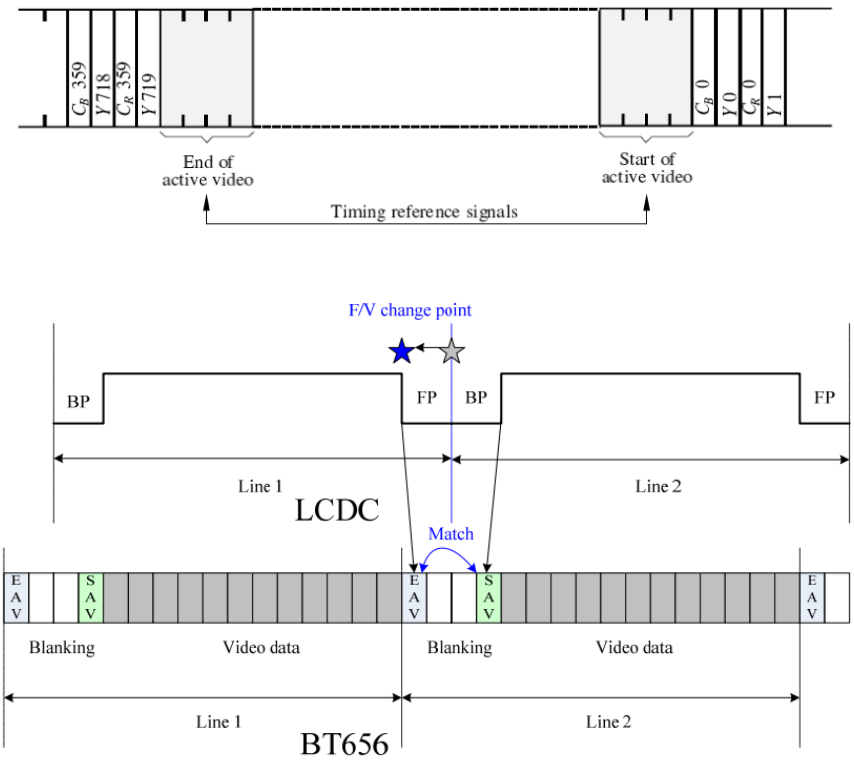


Fig. 11-39 CTA-861 standard timing diagram (interlace mode)

E. BT.656 encoder

VOP extracts the BT656 encoder module separately, the input interface is RGB parallel timing input, and the output is the standard bt656 interface output.

BT656 embeds the line and field synchronization information into the data stream in the form of encoding, which is the so-called Video timing reference codes. Each line includes four parts: SAV, EAV, blanking and video data:

每一行包括SAV、EAV、blanking和video data四个部分：

Copyright © 2024 Rockchip Electronics Co., Ltd.

Fig. 11-40 Timing description of BT656

F. BT.1120 encoder

The encoding method is almost the same as BT656, except that the number of data bits increases and the frequency becomes larger to support the transmission of HD data. Maximum support for data transmission up to 1080p, DCLK to 150M. Supports both interlace and progressive transmission at the same time. The specific timing diagram is as follows.

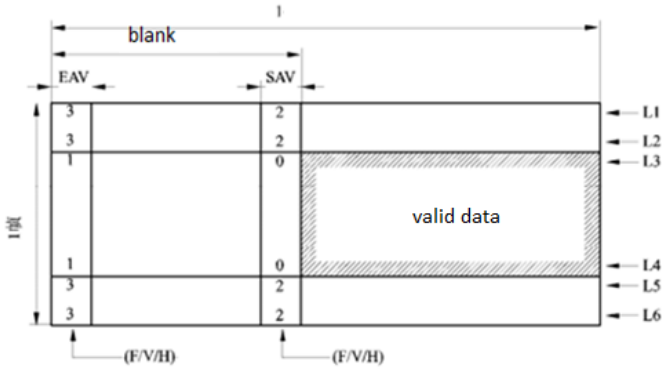

Fig. 11-41 Timing description of BT1120

G. MCU LCD Interface timing

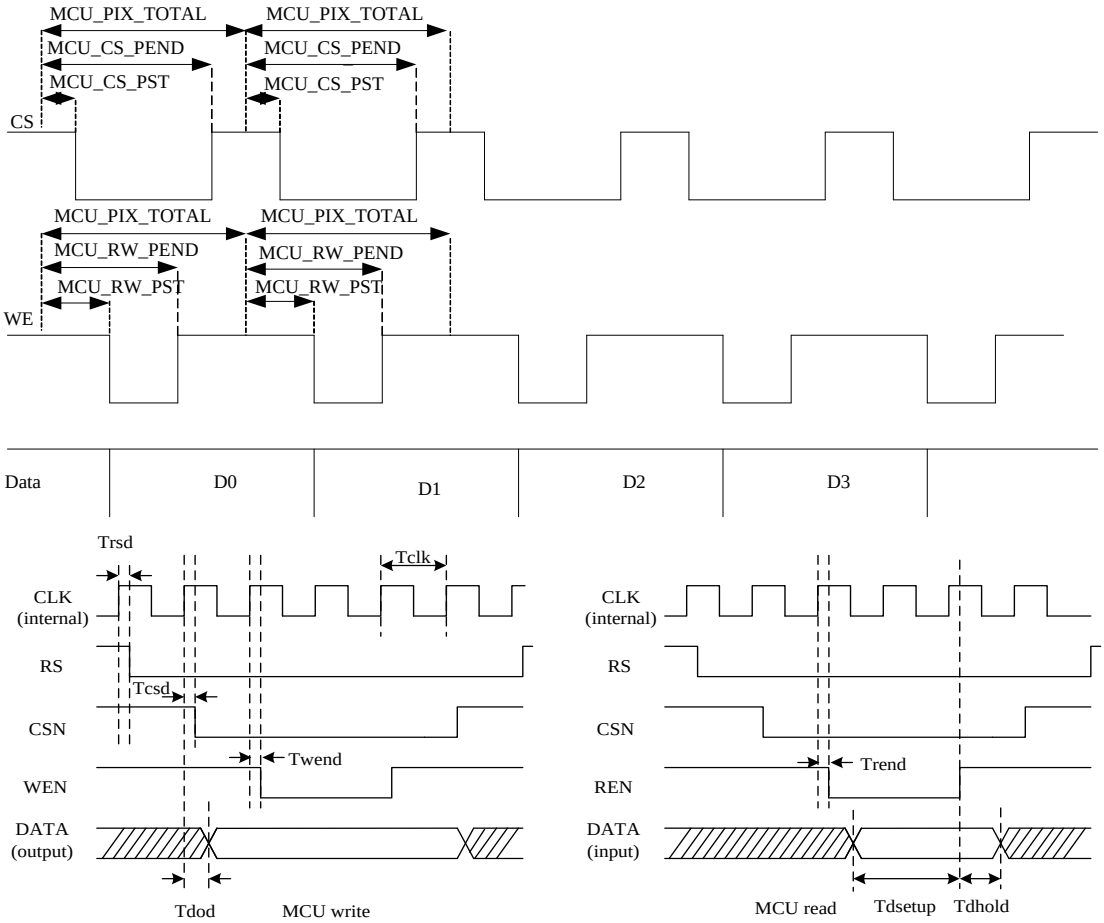

Fig. 11-42 LCDC MCU interface (i80) timing

H. Pre_scan_active

Pre_scan_active define that layers send the read data request early vop post readpixel data in post line buff.

$$Pre_scan_hactive = pre_scan_max_dly + act_width/2 - 1$$

Note: Pre_scan_max define in HDR mode delay set part and Overlay part.
Note: When act_width don't align 2, set act_width' = act_width+1.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Note: Recommend time parameter of 2 pixel align, it must set 2pixel align when post in split mode.

11.5 Register Description

11.5.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

Table 11-6 VOP Address Mapping

Base Address[15:8]	Module	Address Length	Offset Address Range
0x00	SYS_CTRL	512 BYTE	0X0000 ~ 0X01FF
0x05	OVERLAY_SYSTEM	256 BYTE	0X0500 ~ 0X05FF
0x06	OVERLAY_PORT0	256 BYTE	0X0600 ~ 0X06FF
0x07	OVERLAY_PORT1	256 BYTE	0X0700 ~ 0X07FF

11.6 Application Notes

11.6.1 VOP Pixel Clock Configuration

- **dclk**: The clock source of the post-processing module and interface pixel clock, provided by the CRU module in the PD_VOP subsystem.
- **dclk_core**: The operating clock of the scanning timing of the post-processing module.
- **dclk_out**: Output interface operating clock.

11.6.1.1 eDP Interface Clock Frequency Requirements

Only edp interface is connected withzza post0, clk requires 2 frequencies.

edp_clk = post0_core_clk * 2

11.6.2 VOP POST FUNCTION

- Post_split: sharp and post split can not be used at the same time.
  Post_scale and post_split can not be used at the same time.
- Post_sharp: sharp and post split can not be used at the same time.
  Post_scale and post_sharp can not be used at the same time.
- Recommend enable VP0 axi0_urgency_en and set sw_urgency_thl=4, sw_urgency_thh=6.

Chapter 12 EBC

12.1 Overview

EBC is the TCON module for E-ink Electronic Paper Display (EPD).

12.1.1 Features

- **System interface**
  - AHB slave for register configuration
  - AXI master for frame data transfer (DMA)
  - Interrupt output
- **EPD interface**
  - E-ink EPD compatible
  - Up to 2560x1920 resolution, 85fps
  - Up to 32 level gray scale
  - Up to 256 frames every scanning
  - LUT updateable (16KB)
  - Direct mode and LUT mode, THREE_WIN_MODE, EINK_mode
  - All-update mode and Diff-update mode
  - Single-phase and multi-phase mode
  - Support window display
  - Source driver interface
  - Gate driver interface
- **VOP_LITE interface**

EBC and VOP_LITE are mutually exclusive interfaces and can only be configured as one interface statically.

  - Parallel MCU/RGB LCD Interface: 24-bit(RGB888), 18-bit(RGB666), 16-bit(RGB565)
  - Serial MCU/RGB LCD Interface: 3x8-bit(RGB888), 3x6-bit(RGB666), 2x8-bit(RGB565)
  - BT.1120 Interface
  - BT.656 Interface
  - Max output resolution
    - 1920x1080
  - Win2 layer
    - RGB888, ARGB888, RGB565
    - Support virtual display
    - RGB2YUV(BT601/BT709)
  - Support dither down allegro RGB888to666 RGB888to565 and dither down FRC(Frame Rate Control) (configurable) RGB888to666
  - Blank and black display
  - Standby mode
  -

12.2 Block Diagram

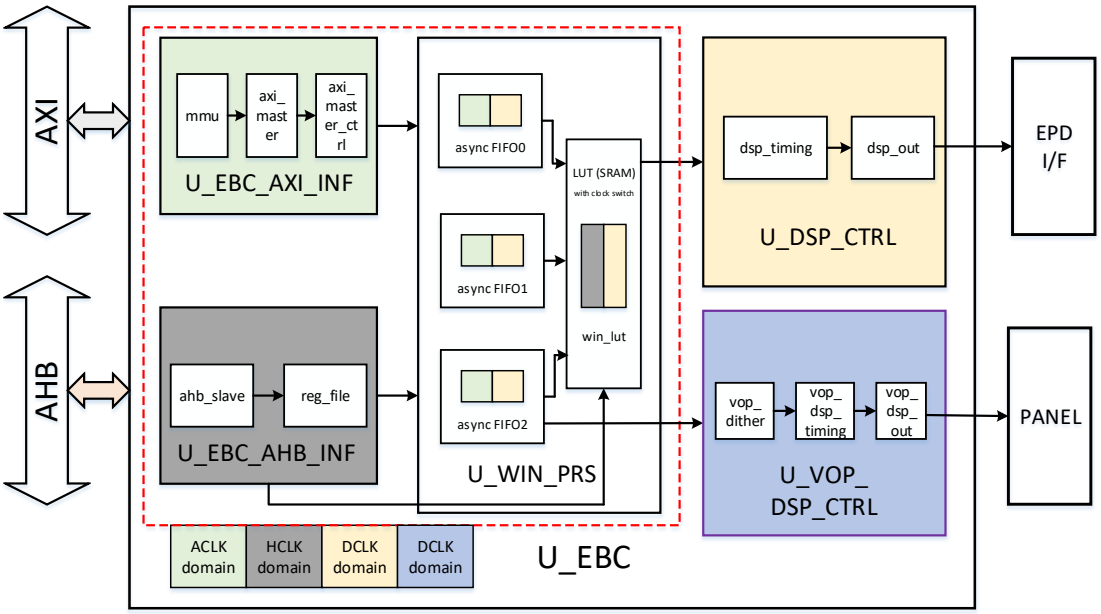

Fig. 12-1 EBC Block Diagram

12.3 Function Description

12.3.1 EBC Data Format

Table 12-1 EBC Input Data Format

DSP_LUT MODE	WIN_FMT [2:0]	Data format	Bit Map
0	xxx	S-data(2bpp)	{S3[7:0], S2[7:0], S1[7:0], S0[7:0]}
1	000	Y-data(4bpp)	{Y7[3:0], Y6[3:0], Y5[3:0], Y4[3:0], Y3[3:0], Y2[3:0], Y1[3:0], Y0[3:0]}
1	001	Y-data(8bpp)	{Y3[7:0], Y2[7:0], Y1[7:0], Y0[7:0]}
1	010	RGB565	{ R1[4:0], G1[5:0], B1[4:0], R0[4:0], G0[5:0], B0[4:0]}
1	011	XRGB8888	{8'bx, R[7:0], G[7:0], B[7:0]}
1	100	Y-data(5bpp)	{Y3[7:0], Y2[7:0], Y1[7:0], Y0[7:0]}

12.3.2 EBC Waveform generation mode

5. Direct mode

In direct scanning mode, the source data is just read by internal DMA and sent to the display output directly.

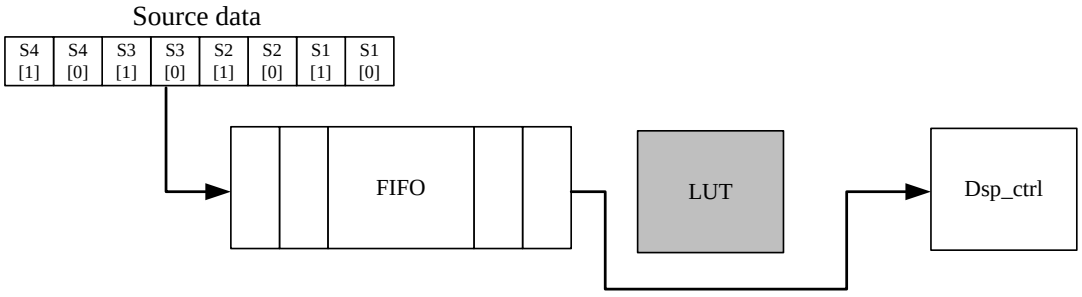

Fig. 12-2 EBC Block Diagram

6. LUT mode

In LUT scanning mode, internal DMA read the original pixel data into the FIFO, then the

Copyright © 2024 Rockchip Electronics Co., Ltd.

pixel data is sent to the look-up table to be translated the EPD source data.

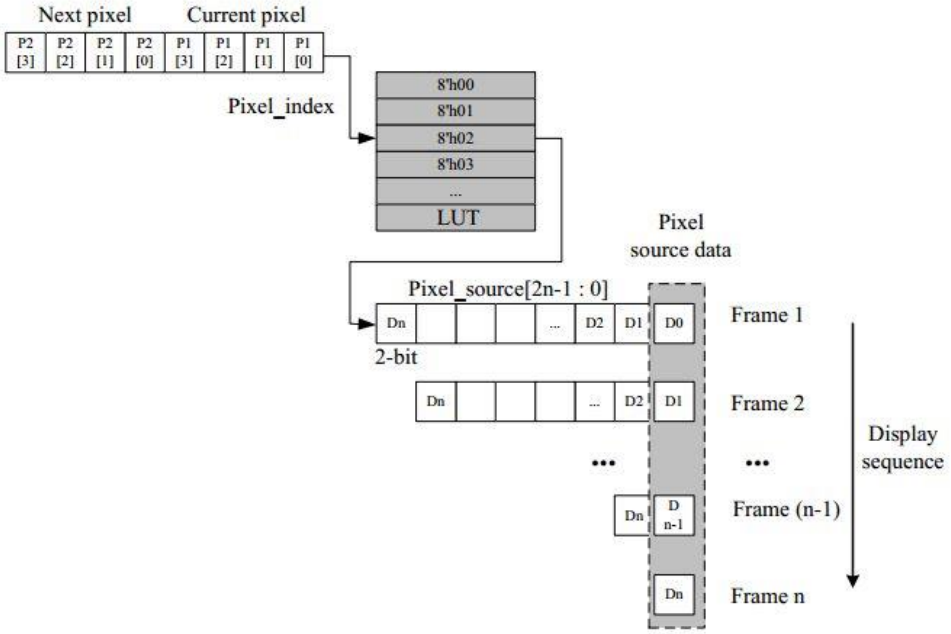

Fig. 12-3 LUT Mode Diagram

Copyright © 2024 Rockchip Electronics Co., Ltd.

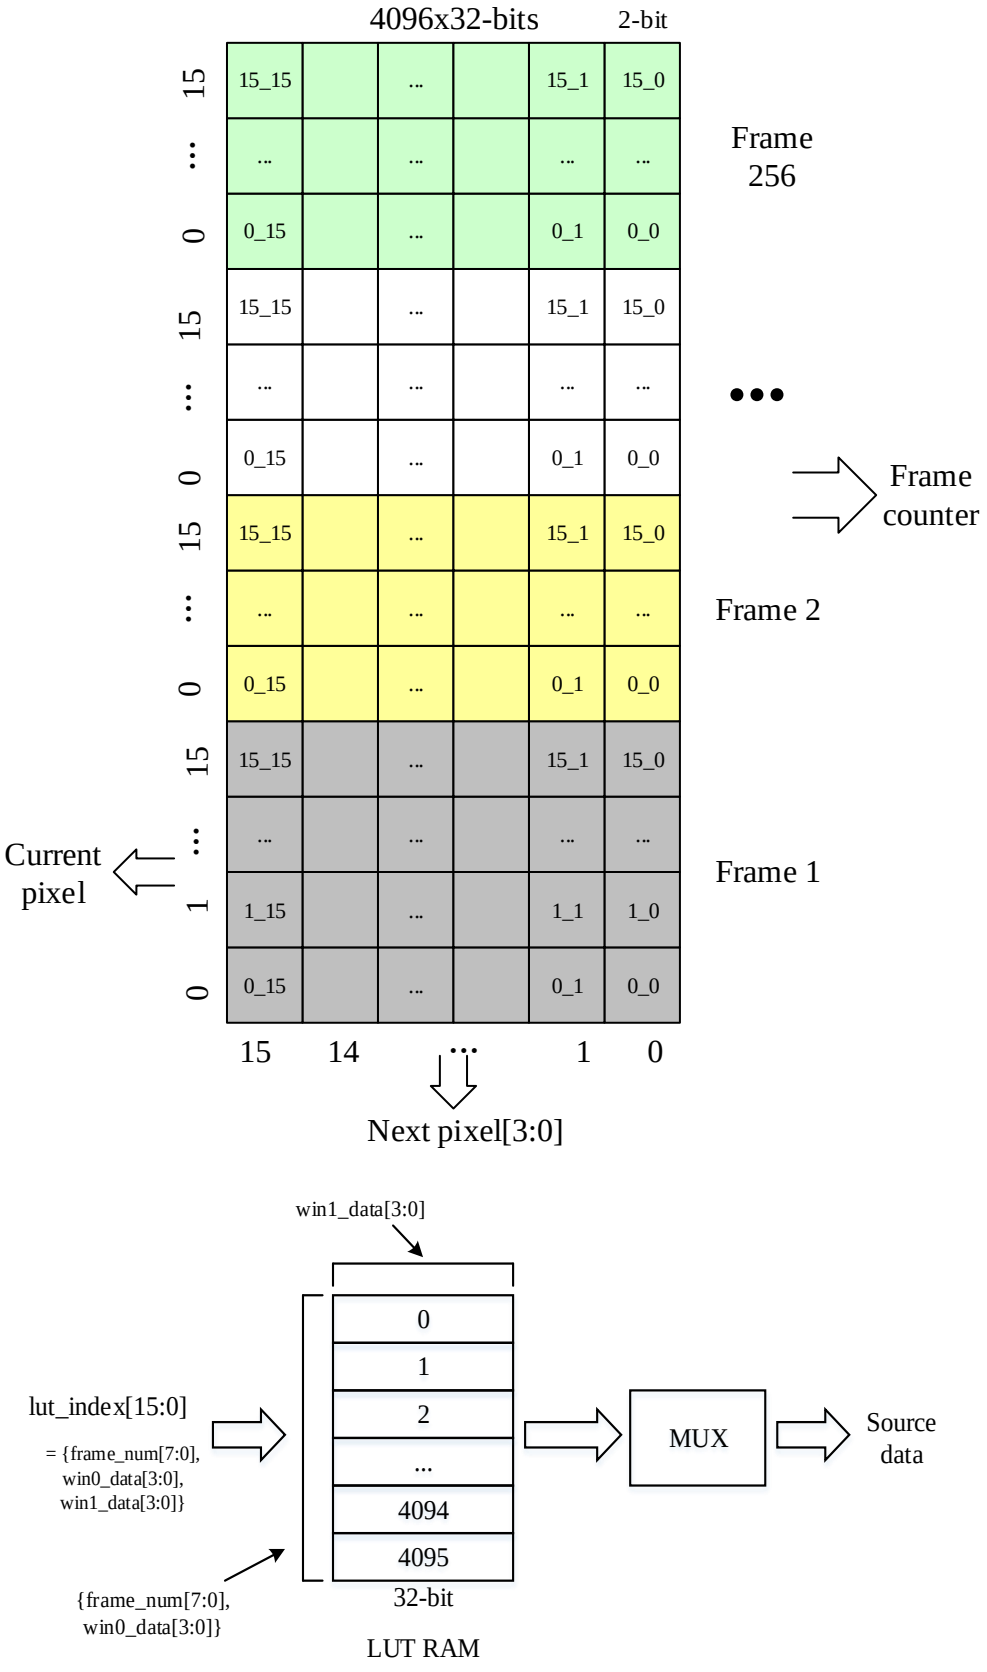

Fig. 12-4 EBC LUT Structure

7. 3win LUT mode

Compared with the LUT mode, in addition to the current image and the target image, the memory also contains frame number information. The frame number information in the

original LUT mode is counted by a counter, while the frame number information in 3win_mode is read from memory.

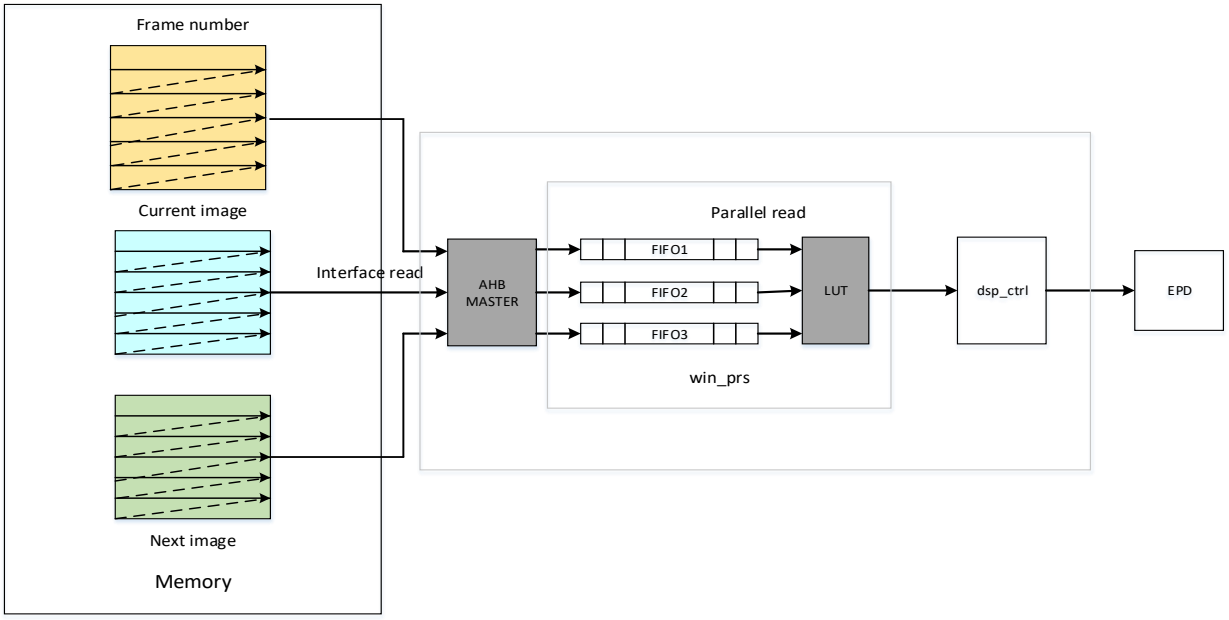

Fig. 12-5 EBC 3win Mode

12.3.3 EBC Window display mode

Window display is supported in EBC, dsp_win_width/dsp_win_height and dsp_win_st should be set to define the display window. The source value of other area is background value, which is configurable.

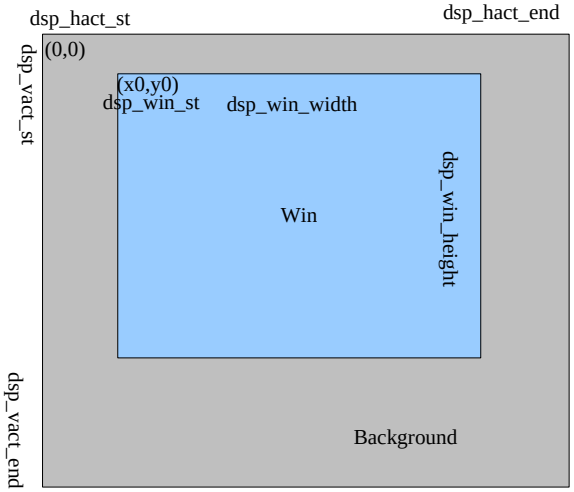

Fig. 12-6 EBC Window Display

12.3.4 EBC IO description

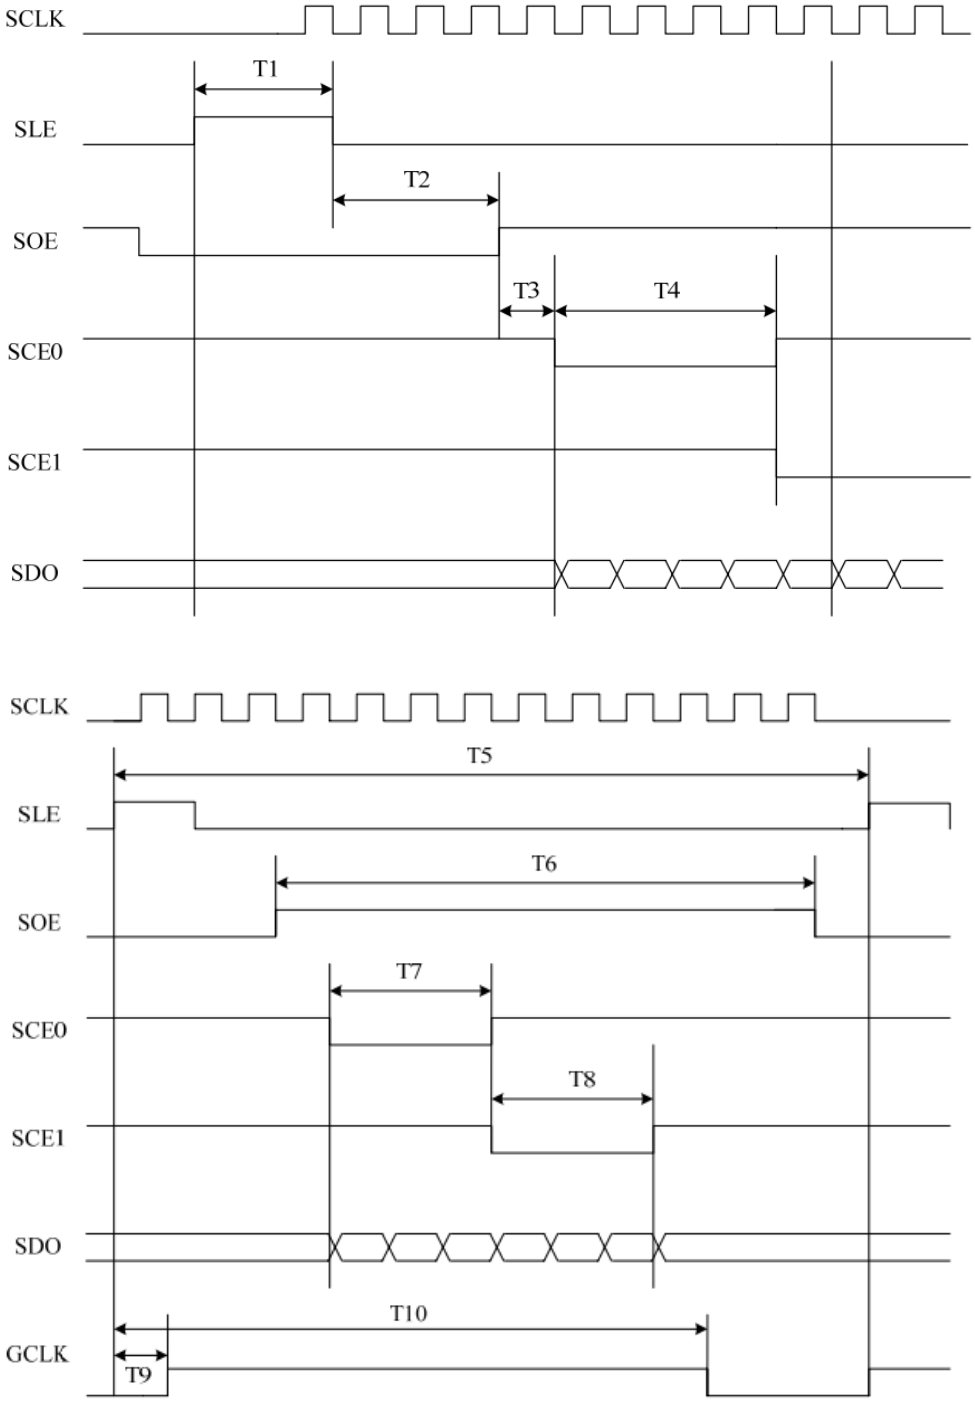

Table 12-2 EBC Output Pins

EBC	Description
ebc_sdclk	Source clock
ebc_sdle	Source latch data enable
ebc_sdoe	Source output enable
ebc_sdce[3:0]	Source chip select
ebc_sddo[15:0]	Source data output
ebc_sdshr	X scanning direction
ebc_gdclk	Gate clock
ebc_gdsp	Gate start pulse
ebc_gdoe	Gate output enable
ebc_vcom	COM voltage control
ebc_pwr[2:0]	POWER control

Timing	Value (6-inch 800x600)	Register setting
GCLK	315 SCLK	DSP_HTOTAL
T11	4 GCLK	DSP_VS_END
T12	107 SCLK	(DSP_GD_END/2)
T13	1 GCLK	Fixed
T14	4 GCLK	(DSP_VACT_ST - DSP_VS_END)
T15	8 GCLK	DSP_VACT_ST
T16	619 GCLK	DSP_VTOTAL
T17	601 GCLK	(DSP_VACT_END - DSP_VACT_ST)
T18	11 GCLK	(DSP_VTOTAL - DSP_VACT_END)

12.3.6 VOP_LITE Data Format

VOP_LITE master read the frame data from the frame buffer in the system memory. There are total 3 formats supported in one layer.

Win2: RGB888, ARGB888, RGB565.

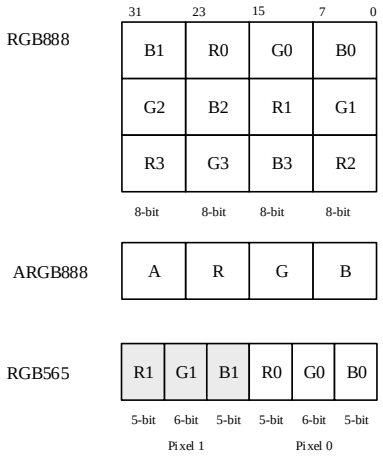

Fig. 12-7 VOP_LITE Frame Buffer Data Format

12.3.7 VOP_LITE Data Path

There is only one data input path which is internal DMA for VOP_LITE to get display layers' pixel data.

Internal DMA

Internal DMA can fetch the pixel data through AXI bus from system memory (DDR) for the display layers. Data fetching is driven by display output requirement.

Copyright © 2024 Rockchip Electronics Co., Ltd.

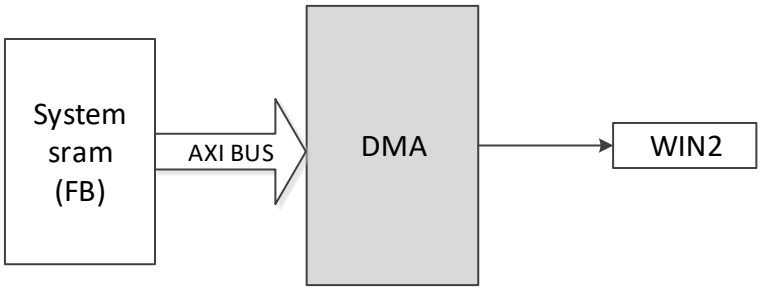

Fig. 12-8 VOP_LITE Internal DMA

12.3.8 VOP_LITE Virtual display

Virtual display is supported in Win2. The active image is part of the virtual (original) image in frame buffer memory. The virtual width is indicated by setting WIN2_VIR_STRIDE for different data format.

The virtual stride should be multiples of word (32-bit). That means dummy bytes in the end of virtual line if the real pixels are not 32-bit aligned.

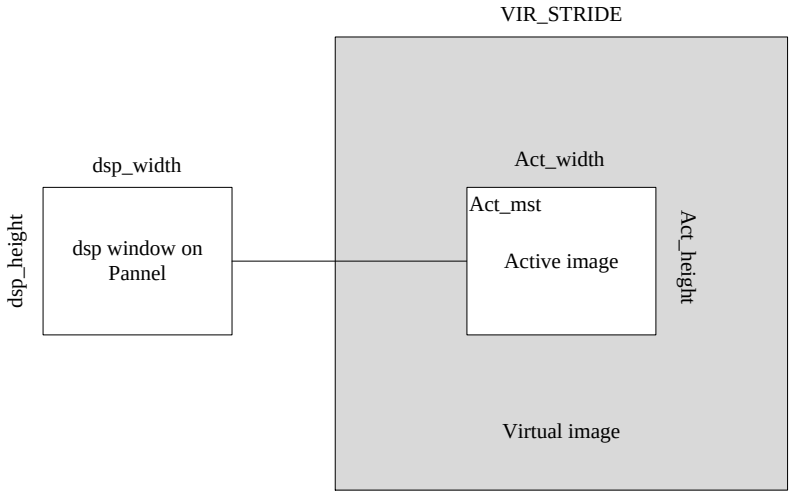

Fig. 12-9 VOP_LITE Virtual Display Mode

12.3.9 VOP_LITE Replication and dither down

1 Replication (dither up)

If the interface data bus is wider than the pixel format size, by programming the pixel components replication active/inactive, the MSB is replicated to the LSB of the interface data bus or the LSB is filled with 0s.

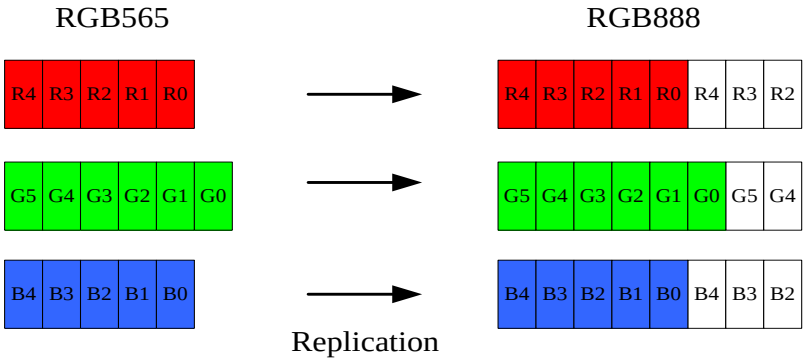

Fig. 12-10 VOP_LITE Replication

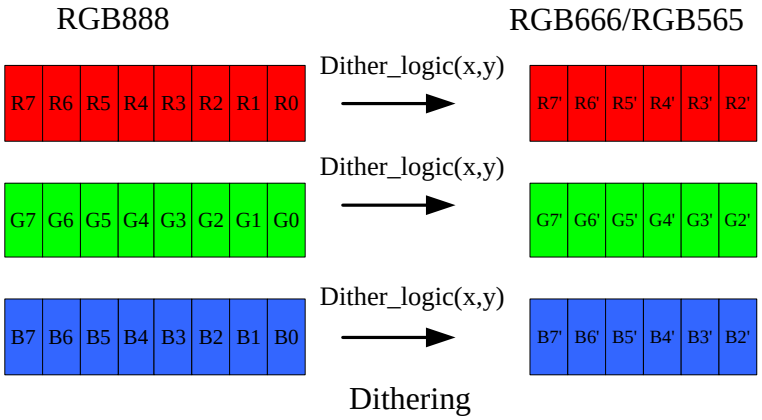
Dithering is used to improve the quality of display the pixel data in a lower color depth on the LCD panel. The Dithering algorithm is based on the (x, y) pixel position, the value of removed bits and frame counter.

Copyright © 2024 Rockchip Electronics Co., Ltd.

2 Dither down

Here we support three kinds of dithering arithmetic. RGB888 to RGB666 has two ways, one is allegro, the other is FRC. RGB888 to RGB565 has only one arithmetic, which is allegro. When Dithering is not enabled, the MSBs of the pixel color components are output on the interface data bus if the interface data bus is smaller than the pixel format size.



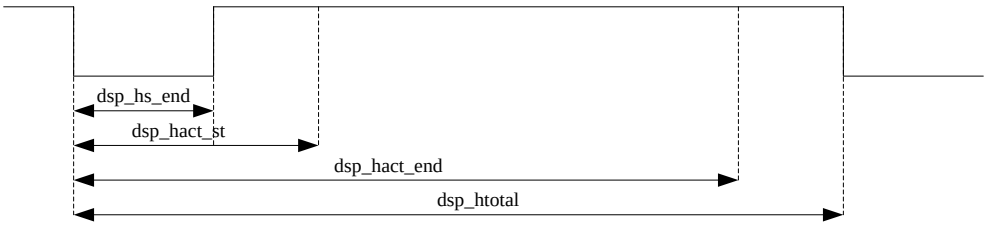


Fig. 12-11 VOP_LITE Dithering

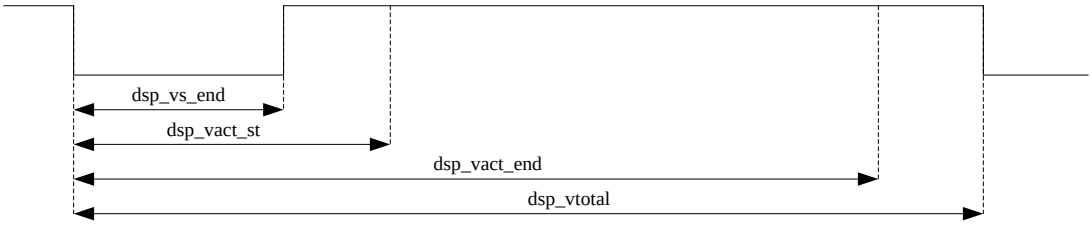

The following figure is the recommended pattern picture in VOP_LITE, you can configure different value of register 0x130~0x144，to change the pattern picture(default value is recommended values below).

12.3.10 VOP_LITE Timing Diagram

12.4.2 Detail Register Description

EBC_DSP_START

Address: Operational Base(0x27900000) + offset (0x0000)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	dsp_rst soft reset bit
0	RW	0x0	dsp_frm_st frame start bit writing '1' to trigger frame display. read this bit for hold status.

EBC_EPD_CTRL

Address: Operational Base(0x27900000) + offset (0x0004)

Bit	Attr	Reset Value	Description
31	RW	0x0	eink_mode_swap 1'b0: No swap 1'b1: Swap
30	RW	0x0	eink_mode_frm_sel 1'b0: Frame cnt 1'b1: Win2 data
29	RW	0x0	dsp_three_win_mode three win mode enable 1'b0: Lut mode or direct mode 1'b1: Three win mode
28	RW	0x0	sw_auto_gating_en auto gating enable 1'b0: Disable 1'b1: Enable
27	RW	0x0	ebc_dma_stop 1'b0: Disable 1'b1: Enable If DMA is working, the stop mode would not be active until current bus transfer is finished.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
26:16	RW	0x000	dsp_gd_end GCLK falling edge point(SCLK), which count from the falling edge of hsync
15:8	RW	0x00	dsp_gd_st GCLK rising edge point(SCLK), which count from the falling edge of hsync
7:6	RW	0x0	dsp_sddw_mode source data output width 1'b0: 8-bit output 1'b1: 16-bit output
5	RW	0x0	epd_auo EPD panel 1'b0: Eink 1'b1: AUO
4:2	RW	0x0	epd_pwr power enable
1	RW	0x0	epd_gdrl gate scanning direction 1'b0: Top to button 1'b1: Button to top
0	RW	0x0	epd_sdshr source scanning direction 1'b0: Left to right 1'b1: Right to left

EBC_DSP_CTRL

Address: Operational Base(0x27900000) + offset (0x0008)

Bit	Attr	Reset Value	Description
31:30	RW	0x0	dsp_swap_mode display swap for 8bit output 2'b00: SDO[7:0] = {P3,P2,P1,P0} 2'b01: SDO[7:0] = {P1,P0,P3,P2} 2'b10: SDO[7:0] = {P2,P3,P0,P1} 2'b11: SDO[7:0] = {P0,P1,P2,P3} for 16bit output 2'b00: SDO[15:0] = {P7,P6,P5,P4,P3,P2,P1,P0} 2'b01: SDO[15:0] = {P4,P5,P6,P7,P0,P1,P2,P3} 2'b10: SDO[15:0] = {P0,P1,P2,P3,P4,P5,P6,P7} 2'b11: SDO[15:0] = {P3,P2,P1,P0,P7,P6,P5,P4}
29	RW	0x0	dsp_diff_mode diff update mode enable 1'b0: Normal update mode 1'b1: Diff update mode
28	RW	0x0	dsp_lut_mode display mode 1'b0: Direct mode 1'b1: LUT mode
27	RW	0x0	dsp_vcom_mode VCOM Mode 1'b0: One phase scanning mode 1'b1: Multi phase scanning mode

EBC_VCOM0

Address: Operational Base(0x27900000) + offset (0x0040)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dsp_border_0 VCOM[1:0] values in 0-15 frame. The VCOM [1:0] indicate the COM voltage in one frame. The VCOM can be different in different frame. So we can set the VCOM [1:0] sequence using display frames before start the display.

EBC_VCOM1

Address: Operational Base(0x27900000) + offset (0x0044)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dsp_border_1 VCOM[1:0] values in 16-31 frame. The VCOM [1:0] indicate the COM voltage in one frame. The VCOM can be different in different frame. So we can set the VCOM [1:0] sequence using display frames before start the display.

EBC_VCOM2

Address: Operational Base(0x27900000) + offset (0x0048)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dsp_border_2 VCOM[1:0] values in 32-47 frame. The VCOM [1:0] indicate the COM voltage in one frame. The VCOM can be different in different frame. So we can set the VCOM [1:0] sequence using display frames before start the display.

EBC_VCOM3

Address: Operational Base(0x27900000) + offset (0x004C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dsp_border_3 VCOM[1:0] values in 48-64 frame. The VCOM [1:0] indicate the COM voltage in one frame. The VCOM can be different in different frame. So we can set the VCOM [1:0] sequence using display frames before start the display.

EBC_CONFIG_DONE

Address: Operational Base(0x27900000) + offset (0x0050)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	reg_config_done In the first setting of the register, the new value was saved into the mirror register. when all the register config finish, writing this register to enable the copyright of the mirror register to real register. then register would be updated at the start of every frame.

EBC_VNUM

Address: Operational Base(0x27900000) + offset (0x0054)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	dsp_vcnt readable register for Internal line number

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
15:0	RW	0x0000	line_flag_num line number of the scanning flag interrupt the display line number when the flag interrupt occur, the range is (0~DSP_VTOTAL-1).

EBC_WIN_MST2

Address: Operational Base(0x27900000) + offset (0x0058)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	win_mst2 start address of frame data in memory

EBC_DSP_CTRL2

Address: Operational Base(0x27900000) + offset (0x005C)

12.6 Application Notes

12.6.1 Common

12.6.1.1 DMA transfer mode

There are three DMA transfer modes for loading win0/win1/win2 frame data determined by following parameters:
dma_burst_length
winx_no_outstanding
winx_gather_en
winx_gather_thres

12.6.1.2 auto outstanding transfer mode(random transfer)

When winx_no_outstanding is 0, multi-bursts transfer command could be sent out to AXI master interface continuously if the internal memory has enough space to store new data. The continuous random burst number is in the range of 1 to 4, mainly depending on the

Copyright © 2024 Rockchip Electronics Co., Ltd.

empty level of internal memory, dma_burst_length, data format and active image width.

12.6.1.3 configured outstanding transfer mode(fixed transfer)

When winx_gather_en is 1, fixed-number of bursts transfer command should be sent out to AXI master interface continuously if the internal memory has enough space to store new data. The fixed-number is determined by win1_gather_thres.

12.6.1.4 DMA control (QoS/Hurry/Outstanding)

If you want to get higher priority for VOP_LITE to access external memory when the frame data is urgent, a QoS and hurry request can be generated and sent out basing on the configured values:
sw_biu_qos_en: SYS_CTRL[0]
sw_biu_qos_value: SYS_CTRL[2:1]
sw_biu_hurry_en: SYS_CTRL[4]
sw_biu_hurry_value: SYS_CTRL[6:5]
sw_biu_hurry_threshold: SYS_CTRL[11:8]
sw_axi_max_outstand_en: SYS_CTRL[12]
sw_axi_max_outstand_num: SYS_CTRL[20:16]
sw_axi_rd_urgency_en: SYS_CTRL[24]
QoS request for higher bus priority for winx.
Max Outstanding number is configurable.

12.6.2 EBC

If you select ebc output, sw_vop_en must be set to 0.
There are three modes in EBC and the specific configuration is as follow.

12.6.2.1 Direct mode

Step1: set dsp_eink_mode=0, dsp_three_win_mode=0, dsp_lut_mode=0;
Step2: set dsp_sdclk_div=4'd3 for 8-bit screen or set dsp_sdclk_div=4'd7 for 16-bit screen;

12.6.2.2 LUT mode

Step1: set dsp_eink_mode=0, dsp_three_win_mode=0, dsp_lut_mode=1;
Step2: set dsp_sdclk_div=4'd3 for 8-bit screen or set dsp_sdclk_div=4'd7 for 16-bit screen;

12.6.2.3 3win LUT mode

Step1: set dsp_eink_mode=0, dsp_three_win_mode=1, dsp_lut_mode=0;
Step2: set dsp_sdclk_div=4'd3 for 8-bit screen or set dsp_sdclk_div=4'd7 for 16-bit screen;

12.6.2.4 Interrupt

EBC interrupt is comprised of 7 interrupt sources:

- Frame end interrupt (when every frame end)
- Display end interrupt (when frame_cnt equals to the dsp_frm_total)
- Frame flag interrupt (when frame_cnt equals to the dsp_frm_int_num)
- Line flag interrupt (when line_cnt equals to the line_flag_int_num)
- Win0 empty interrupt
- Win1 empty interrupt
- Win2 empty interrupt

Every interrupt has independent interrupt mask signal(when xxx_int_msk is 0), interrupt clear signal(xxx_int_clr) and interrupt raw status signal (xxx_int_st).

There is only one interrupt combined with all this interrupt signals to CPU, and it high active.
DMA finish interrupt is used for changing DDR frequency. This interrupt will be asserted when DMA finish getting all the Pixel DATA every frame. This interrupt is asserted at the end of the frame.

Address same interrupt will be asserted at this kind of scenario that all the memory start address configured in EBC register are same compared with the former frame. This interrupt is asserted at the beginning of frame start.

12.6.3 VOP_LITE

Copyright © 2024 Rockchip Electronics Co., Ltd.

If you select vop_lite output, sw_vop_en must be set to 1.
VOP_LITE has two outputs, one is the same as EBC, directly to IO, one is to VO0 module, output to MIPI/HDMI/EDP and so on. If the output is to VO0, then sw_vop_inf_out_en and sw_vop_inf_out_dresetn must be set to 1, otherwise there will be no signal output. If the output interface is MIPI/HDMI, it will also pass through a 1to4 module, which will convert the data out of VOP_LITE into the input required by MIPI/HDMI.
Note that if vop_lite output is selected, it only uses win2, so only configure win2-related registers.

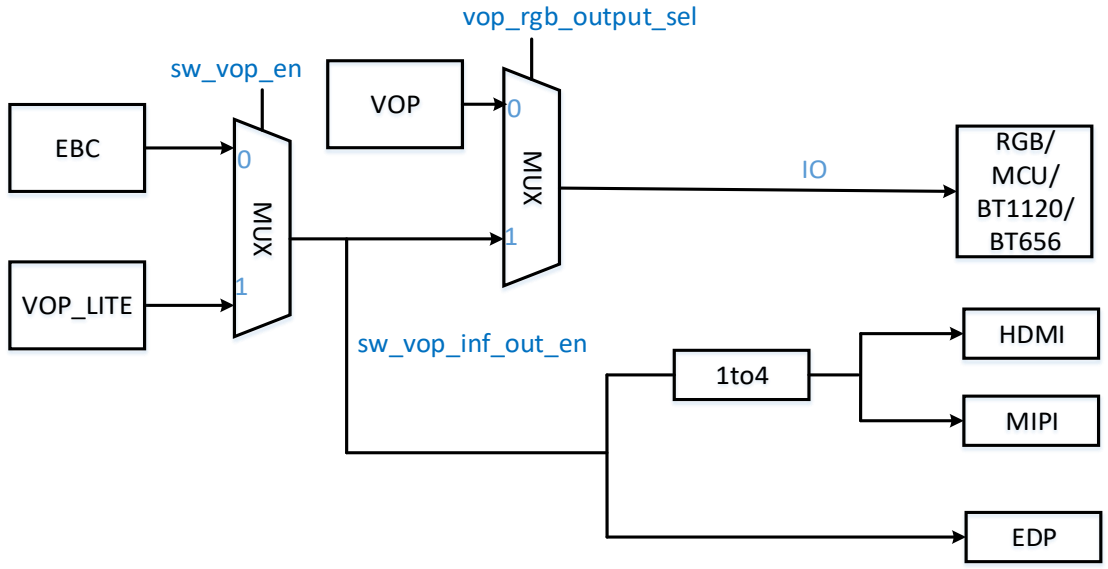

Fig. 12-18 VOP_LITE Path to IO or VO0

12.6.3.1 RGB display mode

RGB display mode is used for RGB panel display. It is a continuous frames display mode.

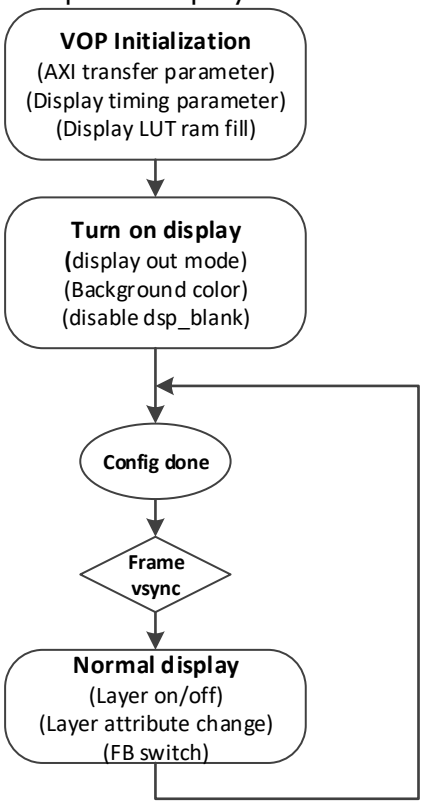

Fig. 12-19 VOP_LITE RGB Mode Programming Flow

1.VOP_LITE initialization

VOP_LITE initialization should be done before turning display on.
First, AXI bus parameter (SYS_CTRL) should be set for DMA transfer.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Second, display panel/interface timing should be set for display output. The registers are: VOP_DSP_HTOTAL_HS_END/ VOP_DSP_HACT_ST_END/ VOP_DSP_VTOTAL_HS_END/ VOP_DSP_VACT_ST_END/ VOP_DSP_VS_ST_END_F1/ VOP_DSP_VACT_ST_END_F1

2.Background display
Before normal display, the background display could be turn on.
First, set display output mode (VOP_DSP_CTRL0/1) according to display device.
Second, disable dsp_blank mode, which would not be enable until frame synchronization.
Finally, writing '1' to "CONFIG_DONE" register then all the frame-sync registers will be enable at the beginning of next frame.

3.Normal display
In normal display, all the display layers' attribute could be different according display scenario. So there is a programming loop in this mode.
First, configure all the display layers' attribute registers for the change of image format, location, size and so on. Those register would not be enable until frame synchronization.

Finally, write 1 to "CONFIG_DONE" register then all the frame-sync registers will be enabled at the beginning of next frame.

12.6.3.2 Interrupt

VOP_LITE interrupt is comprised of 6 interrupt sources:

- frame start interrupt
- bus error interrupt
- DMA finish interrupt
- line flag0 interrupt
- line flag1 interrupt
- Display hold interrupt

Every interrupt has independent interrupt enable signal(VOP_INT_EN), interrupt clear signal(VOP_INT_CLR) and interrupt raw status signal (VOP_INT_STATUS).

12.6.3.3 Parallel IO Select

VOP_LITE outputs directly to IO and makes a mux with VOP. If the output is vop_lite, set vop_rgb_output_sel to 1 (VCCIO_IOC_MISC_CON8[11], refer to the related register description). If the output interface is mcu, set vop_mcu_sel (VCCIO_IOC_MISC_CON8[10]) to 1.

There are vop_dclk_inv_sel (VCCIO_IOC_MISC_CON8[9]) and vop_dclk_dll_sel (VCCIO_IOC_MISC_CON8[8]) , which adjust the phase of the output dclk clock.

12.6.3.4 VO0 setting

The path from VOP_LITE to VO0 will be output to the HDMI/MIPI/EDP module. The following is the relevant configuration to each module.

a. VOP_LITE -> MIPI DSI2 Host
Step1: set VO0_GRF_SOC_CON9[8] = 1, enable DSI Host data source come from EBC;
Step2: set VO0_GRF_SOC_CON13[3:0] = 0x7, config timing polar and mode;

b. VOP_LITE -> HDMI TX Controller
Step1: GRF_V00_CON13 [4] = 1 ; // it enable the grf_sw_hdmi_1to4 with hdmi mode.
Step2: GRF_VO0_CON09 [9] = 1 ; // it enable the hdmi controller data source com from ebc.

c. VOP_LITE -> EDP TX Controller
Step1: set VO0_GRF_SOC_CON9[10] = 1, enable EDP TX data source come from EBC.

Chapter 13 USB3.0 Controller

13.1 Overview

USB3.0 sub-system include USB3.0 controller and some PHYs. The two USB3.0 controller (marked as USB0 and USB1) can act as static host, static device, USB2.0/3.0 A device or B device basing on the status of input ID from USB2.0 PHY. The controller respectively connect to one USB3.0 PHY and one USB2.0 PHY and can perform data transmission between host and device as host or device for Super-Speed/High-Speed/Full-Speed/Low-Speed.
USB3.0 sub-system supports the following features:

- General Features
  1. Compatible Specification
     - Universal Serial Bus 3.0 Specification, Revision 1.0
     - Universal Serial Bus Specification, Revision 2.0
     - eXtensible Host Controller Interface for Universal Serial Bus (xHCI), Revision 1.1
  2. Support Control/Bulk (including stream)/Interrupt/Isochronous Transfer
  3. Simultaneous IN and OUT transfer for USB3.0, up to 8Gbps bandwidth
  4. Descriptor caching and data pre-fetching used to improve system performance in high-latency systems
  5. LPM protocol in USB 2.0 and U0, U1, U2, and U3 states for USB 3.0
  6. Dynamic FIFO memory allocation for endpoints
  7. Keep-Alive feature in LS mode and (micro-)SOFs in HS/FS modes
  8. Low MIPS requirement
     - Driver involved only in setting up transfers and high-level error recovery
     - Hardware handles data packing and routing to a specific pipe
- Application Interface Features
  1. AHB Slave interface
  2. AXI Master interface
     - Programmable burst lengths up to 16
     - Handle fixed burst address alignment
     - Programmable number of outstanding read/write requests up to 16
     - Concurrent read/write to get best performance of USB3.0 duplex operation
- USB3.0 Device Features
  1. Up to 10 IN endpoints, including control endpoint 0
  2. Up to 6 OUT endpoints, including control endpoint 0
  3. Up to 16 endpoint transfer resources, each one for each endpoint
  4. Flexible endpoint configuration for multiple applications/USB set-configuration modes
  5. Hardware handles ERDY and burst
  6. Stream-based bulk endpoints with controller automatically initiating data movement
  7. Isochronous endpoints with isochronous data in data buffers
  8. Flexible Descriptor with rich set of features to support buffer interrupt moderation, multiple transfers, isochronous, control, and scattered buffering support
- USB Class-Specific Device Features
  1. Stream support for UASP application
  2. Gathering of scattered packet to support Ethernet Over USB
  3. Scheduling of multiple Ethernet packets without interrupt
  4. Variable FIFO buffer allocation for each endpoint
  5. For isochronous applications, scheduling of variable-length payloads for each microframe
  6. Microframe precise scheduling for isochronous applications
  7. Configurable endpoint type selection and dynamic FIFO allocation to facilitate multi-function/composite device implementation. During set-config or alternate-setting, device resources are reconfigured to meet the configuration or alternate setting requirements.
- USB 3.0 xHCI Host Features

Copyright © 2024 Rockchip Electronics Co., Ltd.

1. Support up to 64 devices
2. Support 1 interrupter
3. Support 1 USB2.0 port and 1 Super-Speed port
4. Support standard or open-source xHCI and class driver

- USB 3.0 Dual-Role Device (DRD) Features
  1. Static Device Operation
  2. Static Host Operation
  3. USB3.0/USB2.0 OTG A device and B device basing on ID
  4. Not Support USB3.0/USB2.0 OTG session request protocol (SRP), host negotiation protocol (HNP) and Role Swap Protocol (RSP)
- Miscellaneous Features
  5. USB2.0 PHY support Battery Charge detection
  6. USB3.0 PHY combos with PCIE/SATA or DP

13.2 Block Diagram

USB comprises with:

- Bus Interface: Register Interface/Data and Descriptors DMA management
- SS/HS/FS/LS MAC: USB part logic
- USB2.0 PHY: UTMI+ interface USB2.0 PHY
- USB3.0 PHY: USB3.0/PCIE/SATA combo or USB3.0/DP combo

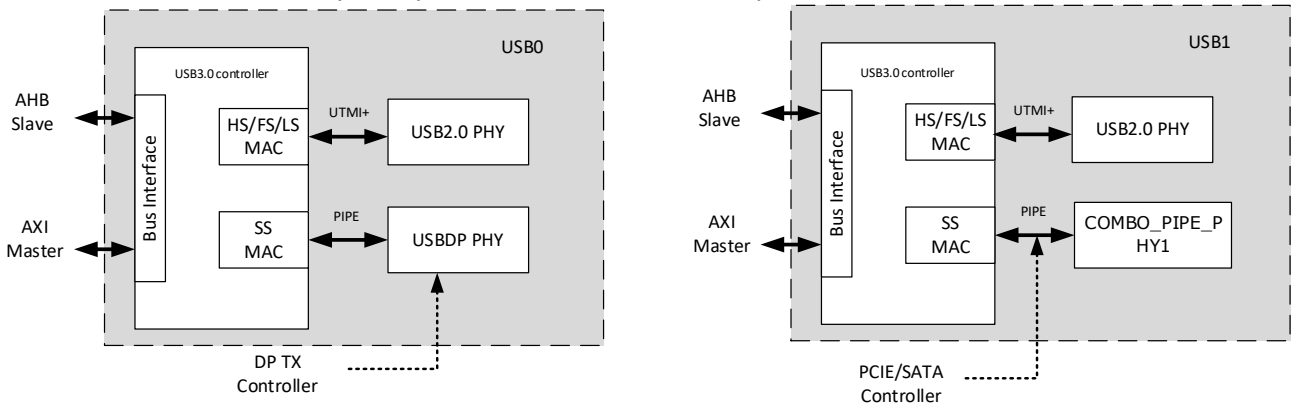

Fig. 13-1 USB3 Block Diagram

13.3 Function Description

USB can act as static xHCI host controller, static device controller, USB3.0/2.0 OTG A device or B device basing on ID of USB2.0 PHY. As device controller, it can work on either USB2.0 speed or Super-Speed basing on speed of host attached to, and process USB transactions described in the descriptors (read back from external memory by AXI master) to/from UTMI+ interface and Pipe Interface.

As host controller, it can work on USB2.0 speed, Super-Speed or both basing on speed or type of attached device, and process USB transactions described in the descriptors (read back from external memory by AXI master) to/from UTMI+ interface and Pipe Interface.

13.4 Register Description

13.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

Operational Base

Name	Base Address
USB0	0x23000000
USB1	0x23400000

13.4.2 Registers Summary

Name	Offset	Size	Reset Value	Description
USB3OTG_GSBUSCFG0	0xC100	W	0x00000001	Global SoC Bus Configuration Register 0
USB3OTG_GSBUSCFG1	0xC104	W	0x00000300	Global SoC Bus Configuration Register 1
USB3OTG_GTXTHRCFG	0xC108	W	0x00000000	Global Tx Threshold Control Register
USB3OTG_GRXTHRCFG	0xC10C	W	0x00000000	Global Rx Threshold Control Register
USB3OTG_GCTL	0xC110	W	0x13512004	Global Core Control Register
USB3OTG_GSTS	0xC118	W	0x7E800000	Global Status Register
USB3OTG_GUCTL1	0xC11C	W	0x0004018A	Global User Control Register 1
USB3OTG_GSNPSID	0xC120	W	0x5533300A	Global SNPS ID Register
USB3OTG_GGPIO	0xC124	W	0x00000000	Global General Purpose Input/Output Register
USB3OTG_GUID	0xC128	W	0x20190520	Global User ID Register
USB3OTG_GUCTL	0xC12C	W	0x02008010	Global User Control Register
USB3OTG_GBUSERRADDRLO	0xC130	W	0x00000000	Global SoC Bus Error Address Register - Low
USB3OTG_GBUSERRADDRHI	0xC134	W	0x00000000	Global SoC Bus Error Address Register - High
USB3OTG_GPRTBIMAPLO	0xC138	W	0x00000000	Global SS Port to Bus Instance Mapping Register
USB3OTG_GHWPARAMS0	0xC140	W	0x2020400A	Global Hardware Parameters Register 0
USB3OTG_GHWPARAMS1	0xC144	W	0x0120C93B	Global Hardware Parameters Register 1
USB3OTG_GHWPARAMS2	0xC148	W	0x20190520	Global Hardware Parameters Register 2
USB3OTG_GHWPARAMS3	0xC14C	W	0x069CD084	Global Hardware Parameters Register 3
USB3OTG_GHWPARAMS4	0xC150	W	0x47822010	Global Hardware Parameters Register 4
USB3OTG_GHWPARAMS5	0xC154	W	0x04204018	Global Hardware Parameters Register 5
USB3OTG_GHWPARAMS6	0xC158	W	0x09D78020	Global Hardware Parameters Register 6
USB3OTG_GHWPARAMS7	0xC15C	W	0x00000000	Global Hardware Parameters Register 7
USB3OTG_GDBGFIFOSPACE	0xC160	W	0x000A0000	Global Debug Queue/FIFO Space Available Register
USB3OTG_GDBGLNMCC	0xC168	W	0x00000000	Global Debug LNMCC Register
USB3OTG_GDBGBMU	0xC16C	W	0x00000000	Global Debug BMU Register
USB3OTG_GDBGLSPMUX	0xC170	W	0x003F0000	Global Debug LSP MUX Register - Device
USB3OTG_GDBGLSP	0xC174	W	0x00000000	Global Debug LSP Register
USB3OTG_GDBGEPINFO0	0xC178	W	0x00000000	Global Debug Endpoint Information Register 0
USB3OTG_GDBGEPINFO1	0xC17C	W	0x00800000	Global Debug Endpoint Information Register 1
USB3OTG_GPRTBIMAP_HSLO	0xC180	W	0x00000000	Global High-Speed Port to Bus Instance Mapping Register - Low
USB3OTG_GPRTBIMAP_FSLO	0xC188	W	0x00000000	Global Full-Speed Port to Bus Instance Mapping Register - Low

13.4.3 Detail Registers Description

USB3OTG_GSBUSCFG0

Address: **Operational Base** + offset (0xC100)

Bit	Attr	Reset Value	Description
31:28	RW	0x0	datrdreqinfo AXI-cache for Data Read (DatRdReqInfo).
27:24	RW	0x0	desrdreqinfo AXI-cache for Descriptor Read (DesRdReqInfo).
23:20	RW	0x0	datwrreqinfo AXI-cache for Data Write (DatWrReqInfo).
19:16	RW	0x0	deswrreqinfo AXI-cache for Descriptor Write (DesWrReqInfo).
15:12	RO	0x0	reserved
11	RW	0x0	datbigend This bit controls the endian mode for data accesses. 1'b0: Little-endian (default) 1'b1: Big-endian
10	RW	0x0	desbigend This bit controls the endian mode for descriptor accesses. 1'b0: Little-endian (default) 1'b1: Big-endian
9:8	RO	0x0	reserved
7	RW	0x0	incr256brstena If software set this bit to 1, the AXI master uses INCR to do the 256-beat burst.
6	RW	0x0	incr128brstena If software set this bit to 1, the AXI master uses INCR to do the 128-beat burst.
5	RW	0x0	incr64brstena If software set this bit to 1, AXI master uses INCR to do the 64-beat burst.
4	RW	0x0	incr32brstena If software set this bit to 1, the AXI master uses INCR to do the 32-beat burst.
3	RW	0x0	incr16brstena If software set this bit to 1, the AXI master uses INCR to do the 16-beat burst.
2	RW	0x0	incr8brstena If software set this bit to 1, the AXI master uses INCR to do the 8-beat burst.
1	RW	0x0	incr4brstena When this bit is enabled the controller is allowed to do bursts of beat length 1, 2, 3, and 4. It is highly recommended that this bit is enabled to prevent descriptor reads and writes from being broken up into separate transfers.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
0	RW	0x1	incrbrstena This bit determines the set of burst lengths the master interface uses. It works in conjunction with the GSBUSCFG0[7:1] enables(INCR256/128/64/32/16/8/4). 0: INCRX burst mode ARLEN/AWLEN do not use INCR. They use only the following burst lengths: 4 (if GSBUSCFG0.INCR4BrstEna = 1); 8 (if GSBUSCFG0.INCR8BrstEna = 1); 16 (if GSBUSCFG0.INCR16BrstEna = 1); 32 (if GSBUSCFG0.INCR32BrstEna = 1); 64 (if GSBUSCFG0.INCR64BrstEna = 1); 128 (if GSBUSCFG0.INCR128BrstEna = 1); 256 (if GSBUSCFG0.INCR256BrstEna = 1); 1: INCR (undefined length) burst mode; ARLEN/AWLEN uses any length less than or equal to the largest-enabled burst length of INCR4/8/16/32/64/128/256. For cache line-aligned applications, this bit is typically set to 0 to ensure that the master interface uses only power-of-2 burst lengths (as enabled via GSBUSCFG0[7:0]).

USB3OTG_GSBUSCFG1

Address: **Operational Base** + offset (0xC104)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12	RW	0x0	en1kpage 1K Page Boundary Enable. By default (this bit is disabled) the AXI breaks transfers at the 4k page boundary. When this bit is enabled, the AXI master (DMA data) breaks transfers at the 1k page boundary.
11:8	RW	0x3	pipe_trans_limit AXI Pipelined Transfers Burst Request Limit. The field controls the number of outstanding pipelined transfer requests the AXI master pushes to the AXI slave. When the AXI master reaches this limit, it does not make any more requests on the AXI ARADDR and AWADDR buses until the associated data phases complete. This field is encoded as follows: 4'h0: 1 request 4'h1: 2 requests 4'h2: 3 requests 4'h3: 4 requests ... 4'hF: 16 requests
7:0	RO	0x00	reserved

USB3OTG_GTXTHRCFG

Address: **Operational Base** + offset (0xC108)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
29	RO	0x0	USBTxPktCntSel This field enables/disables the USB transmission multi-packet thresholding: 1'b0: USB transmission multi-packet thresholding is disabled; the core can only start transmission on the USB after the entire packet has been fetched into the corresponding TXFIFO. 1'b1: USB transmission multi-packet thresholding is enabled. The core can only start transmission on the USB after USB Transmit Packet Count amounts of packets for the USB transaction (burst) are already in the corresponding TXFIFO. This mode is only valid in the host mode. It is only used for SuperSpeed.
28	RO	0x0	reserved
27:24	RW	0x0	USBTxPktCnt This field specifies the number of packets that must be in the TXFIFO before the core can start transmission for the corresponding USB transaction (burst). This field is only valid when the USB Transmit Packet Count Enable field is set to one. Valid values are from 1 to 15. Note: This field must be less than or equal to the USB Maximum TX Burst Size field.
23:16	RW	0x00	USBMaxTxBurstSize USB Maximum TX Burst Size When USBTxPktCntSel is one, this field specifies the Maximum Bulk OUT burst the core can do. When the system bus is slower than the USB, TX FIFO can underrun during a long burst. You can program a smaller value to this field to limit the TX burst size that the core can execute. Host mode: It only applies to SS Bulk, Isochronous, and Interrupt OUT endpoints. Device mode: This value is not used in device mode, but users need to program a value when using the TX threshold feature to make sure that the value programmed in USBTxPktCnt is less than this value. Valid values are from 1 to 16.
15:0	RO	0x0000	reserved

USB3OTG_GRXTHRCFG

Address: **Operational Base** + offset (0xC10C)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29	RW	0x0	usb_rx_pkt_cntsel USB ReceivePacket Count Enable. This field enables/disables the USB reception multi-packet thresholding: 1'b0: The core can only start reception on the USB when the RX FIFO has space for at least one packet. 1'b1: Not applied. If you are using external buffer control (EBC) feature, disable this mode by setting USBRxPktCntSel to 0.
28:13	RO	0x0000	reserved

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
12:0	RW	0x0000	resvl_socout_spc Space reserved in rx fifo for ISOC OUT. In host mode, this field is not applicable and must be programmed to 0. In device mode, this value represents the amount of space to be reserved for ISOC OUT packets. The value to be programmed should be chosen so as to ensure that non ISOC packets are not completely dropped, If no space needs to be reserved for ISOC OUT packets, program this field to 0. This field is valid only in device mode. The maximum configurable depth of rx fifo is 8192. Therefore, this field is 13 bits wide. For HS/FS, the space reservation is the actual value.

USB3OTG_GCTL

Address: **Operational Base** + offset (0xC110)

Bit	Attr	Reset Value	Description
31:19	RW	0x026a	pwrdnscale Not applied.
18	RW	0x0	masterfiltbypass Master Filter Bypass When this bit is set to 1'b1, all the filters are bypassed. The double synchronizers to mac_clk preceding the filters are also bypassed. For enabling the filters, this bit must be 1'b0.
17	RW	0x0	bypassetaddr Bypass SetAddress in Device Mode. When BYPSSETADDR bit is set, the device core uses the value in the DCFG[DevAddr] bits directly for comparing the device address in the tokens. For simulation, you can use this feature to avoid sending an actual SET ADDRESS control transfer on the USB, and make the device core respond to a new address. Note: You can set this bit for simulation purposes only. In the actual hardware, this bit must be set to 1'b0.
16	RW	0x1	u2rstecn Device controller on USB 2.0 reset checks for receiver termination eight times per attempt if this bit is set to zero, or only once per attempt if the bit is set to one. Note: This bit is applicable only in device mode.
15:14	RW	0x0	frmscldwn This field scales down device view of a SOF/USOF duration. For HS mode: Value of 2'h3 implements interval to be 15.625 us Value of 2'h2 implements interval to be 31.25 us Value of 2'h1 implements interval to be 62.5 us Value of 2'h0 implements interval to be 125us For FS mode, the scale-down value is multiplied by 8. This field also scales down the MaxPacketSize of the IN and OUT bulk endpoint to allow more traffic during simulation. It can only be changed from a non-zero value during simulation. 2'h0: 1024 bytes 2'h1: 512 bytes 2'h2: 256 bytes 2'h3: 128 bytes

Copyright © 2024 Rockchip Electronics Co., Ltd.

11	RW	0x0	coresoftreset Core Soft Reset (CoreSoftReset) 1'b0: No soft reset; 1'b1: Soft reset to core Clears the interrupts and all the CSRs except the following registers: GCTL; GUCTL; GSTS; GSNPSID; GGPIO; GUID; GUSB2PHYCFGn registers; GUSB3PIPECTLn registers; DCFG; DCTL; DEVTEN; DSTS.
10	RW	0x0	sofitpsync Not applied.
9	RW	0x0	u1u2_timescale Not applied.
8	RW	0x0	debugattach Debug Attach. Not applied.
7:6	RW	0x0	ramclksel RAM Clock Select (RAMClkSel) 2'b00: bus clock 2'b01: pipe clock (Only used in device mode) 2'b10: In device mode, pipe/2 clock. In Host mode, controller switches ram_clk between pipe/2 clock, mac2_clk and bus_clk based on the status of the U2 ports 2'b11: In device mode, selects mac2_clk as ram_clk (when 8-bit UTMI or ULPI used. Not supported in 16-bit UTMI mode); In Host mode, controller switches ram_clk between pipe_clk, mac2_clk and bus_clk based on the status of the U2 ports. In device mode, upon a USB reset and USB disconnect, the hardware clears these bits to 2'b00.
5:4	RW	0x0	scaledown Scale-Down Mode (ScaleDown) When Scale-Down mode is enabled for simulation, the core uses scaled-down timing values, resulting in faster simulations. When Scale-Down mode is disabled, actual timing values are used. This is required for hardware operation. HS/FS/LS Modes: 2'b00: Disables all scale-downs. Actual timing values are used. 2'b01: Enables scale-down of all timing values except Device mode suspend and resume. These include Speed enumeration, HNP/SRP, and Host mode suspend and resume 2'b10: Enables scale-down of Device mode suspend and resume timing values only. 2'b11: Enables bit 0 and bit 1 scale-down timing values.
3	RW	0x0	disscramble Disable Scrambling (DisScramble) Transmit request to Link Partner on next transition to Recovery or Polling.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
2	RW	0x1	u2exit_lfps If this bit is: 1'b0: the link treats 248ns LFPS as a valid U2 exit. 1'b1: the link waits for 8us of LFPS before it detects a valid U2 exit. This bit is added to improve interoperability with a third part host controller. This host controller in U2 state while performing receiver detection generates an LFPS glitch of about 4ms duration. This causes the device to exit from U2 state because the LFPS filter value is 248ns. With the new functionality enabled, the device can stay in U2 while ignoring this glitch from the host controller.
1	RO	0x0	gbl_hibernation_en This bit enables hibernation at the global level. If hibernation is not enabled through this bit, the PMU immediately accepts the D0->D3 and D3->D0 power state change requests, but does not save or restore any core state. In addition, the PMUs never drive the PHY interfaces and let the core continue to drive the PHY interfaces.
0	RW	0x0	dsblclkgtng Disable Clock Gating. This bit is set to 1 and the core is in Low Power mode, internal clock gating is disabled. You can set this bit to 1'b1 after Power On Reset.

USB3OTG_GUCTL1

Address: **Operational Base** + offset (0xC11C)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29	RW	0x0	filter_se0_fsls_eop 1'b0: Default behaviour, no change in Linestate check for SE0 detection in FS/LS. 1'b1: Feature enabled, FS/LS SE0 is filtered for 2 clocks for detecting EOP. This bit is applicable for FS/LS operation. If this feature is enabled, then SE0 on the Linestate is validated for 2 consecutive utmi/ulpi clock edges for EOP detection. This feature is applicable only in FS in device mode and FS/LS mode of operation in host mode. Device mode: FS - If GUCTL1.FILTER_SE0_FSLS_EOP is set, then for device LPM handshake, the core will ignore single SE0 glitch on the Linestate during transmit. Only 2 or more SE0 is considered as a valid EOP on FS. Host mode: FS/LS - If GUCTL1.FILTER_SE0_FSLS_EOP is set, then the core will ignore single SE0 glitch on the Linestate during transmit. Only 2 or more SE0 is considered as a valid EOP on FS/LS port. Enable this feature if the Linestate has SE0 glitches during transmission. This bit is quasi-static, i.e., should not be changed during device operation.

Bit	Attr	Reset Value	Description
28	RW	0x0	tx_ipgap_linecheck_dis 1'b0: Default behavior, no change in Linestate check. 1'b1: Feature enable, 2.0 MAC disables Linestate check during HS transmit. This bit is applicable for HS operation of u2mac. If this feature is enabled, then the 2.0 mac operating in HS ignores the UTMI/ULPI Linestate during the transmit of a token (during token-to-token and token-to-data IPGAP). When enabled, the controller implements a fixed 40-bit TxEndDelay after the packet is given on UTMI and ignores the Linestate during this time. This feature is applicable only in HS mode of operation. Device mode: If GUCTL1.TX_IPGAP_LINECHECK_DIS is set, then for device LPM handshake, the core will ignore the Linestate after TX and wait for a fixed clocks (40 bit times equivalent) after transmitting ACK on utmi. Host mode: If GUCTL1.TX_IPGAP_LINECHECK_DIS is set, then the ipgap between (tkn to tkn/data) is added by 40 bit times of TXENDDELAY, and linestate is ignored during this 40 bit times delay. Enable this bit if the LineState will not reflect the expected line state (J) during transmission. This bit is quasi-static, i.e., should not be changed during device operation.
27	RW	0x0	dev_trb_out_spr_ind 1'b0: Default behavior, no change in TRB status dword. 1'b1: Feature enable, OUT TRB status indicates Short Packet. This bit is applicable for device mode only (and ignored in host mode). If the device application (SW/HW) wants to know if a short packet was received for an OUT in the TRB status itself, then this feature can be enabled, so that a bit is set in the TRB writeback in the buf_size dword. Bit[26] - SPR of the trbstatus, RSVD, SPR,PCM1, bufsize dword will be set during an OUT transfer TRB write back if this is the last TRB used for that transfer descriptor. This bit is quasi-static, i.e., should not be changed during device operation.
26	RW	0x0	dve_force_20clk_for_30clk Not applied.
25	RW	0x0	p3_in_u2 Not applied.

Bit	Attr	Reset Value	Description
24	RW	0x0	dev_l1_exit_by_hw 1'b0: Default behavior, disables device L1 hardware exit logic. 1'b1: Feature enabled This bit is applicable for device mode (2.0) only. This field enables device controller sending remote wakeup for L1 if the device becomes ready for sending/accepting data when in L1 state. If the host expects the device to send remote wkp signaling to resume after going into L1 in flow controlled state, then this bit can be set to send the remote wake signal automatically when the device controller becomes ready. This HW remote wake feature is applicable only to bulk and interrupt transfers, and not for Isoch/Control When control transfers are in progress, the LPM will be rejected (NYET response). Only after control transfers are completed (either with ACK/STALL), LPM will be accepted For Isoch transfers, the host needs to do the wake-up and start the transfer. Device controller will not do remote-wakeup when Isoch endpoints get ready. The device SW needs to keep the GUSB2PHYCFG[EnblSlpM] reset in order to keep the PHY clock to be running for keeping track of SOF intervals. When L1 hibernation is enabled, the controller will not do automatic exit for hibernation requests thru L1. This bit is quasi-static, i.e., should not be changed during device operation.
23:21	RW	0x0	ip_gap_add_on This register field is used to add on to the default inter packet gap setting in the USB 2.0 MAC.
20	RW	0x0	dev_lsp_tail_lock_dis 1'b0: Default behaviour, enables device lsp lock logic for tail TRB update. 1'b1: Fix disabled This is a bug fix for STAR 9000716195 that affects the CSP mode for OUT endpoints in device mode. The issue is that tail TRB index is not synchronized with the cache Scratchpad bytecount update. If the fast-forward request comes in-between the bytecount update on a newly fetched TRB and the tail-index write update in TPF, the RDP works on an incorrect tail index and misses the byte count decrement for the newly fetched TRB in the fast-forwarding process. This fix needs to be present all the times.
19	RW	0x0	nak_per_enh_fs 1'b1: Enables performance enhancement for FS async endpoints in the presence of NAKs. 1'b0: Enhancement not applied. If a periodic endpoint is present, and if a bulk endpoint which is also active is being NAKed by the device, then this could result in a decrease in performance of other Full Speed bulk endpoint which is ACKed by the device. Setting this bit to 1, will enable the host controller to schedule more transactions to the async endpoints (bulk/ control) and hence will improve the performance of the bulk endpoint. This control bit should be enabled only if the existing performance with the default setting is not sufficient for your FullSpeed application. Setting this bit will only control, and is only required for Full Speed transfers.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
18	RW	0x1	nak_per_enh_hs 1'b1: Enables performance enhancement for HS async endpoints in the presence of NAKs. 1'b0: Enhancement not applied. If a periodic endpoint is present, and if a bulk endpoint which is also active is being NAKed by the device, then this could result in a decrease in performance of other High Speed bulk endpoint which is ACKed by the device. Setting this bit to 1, will enable the host controller to schedule more transactions to the async endpoints (bulk/ control) and hence will improve the performance of the bulk endpoint. This control bit should be enabled only if the existing performance with the default setting is not sufficient for your HighSpeed application. Setting this bit will only control, and is only required for High Speed transfers.
17	RW	0x0	parkmode_disbale_ss Not applied.
16	RW	0x0	parkmode_disable_hs This bit is used only in host mode. When this bit is set to 1 all HS bus instances park mode are disabled. To improve performance in park mode, the xHCI scheduler queues in three requests of 4 packets each for High Speed asynchronous endpoints in a micro-frame. But if a device is slow and if it NAKs more than 3 times, then it is rescheduled only in the next micro-frame. This could decrease the performance of a slow device even further. In a few High Speed devices (such as Sandisk Cruzer Blade 4GB VID: 1921, PID: 21863 and Flex Drive VID: 3744, PID: 8552) when an IN request is sent within 900ns of the ACK of the previous packet, these devices send a NAK. When connected to these devices, if required, the software can disable the park mode if you see performance drop in your system. When park mode is disabled, pipelining of multiple packet is disabled and instead one packet at a time is requested by the scheduler. This allows up to 12 NAKs in a micro-frame and improves performance of these slow devices.
15	RW	0x0	parkmod_disavale_fsls This bit is used only in host mode, and is for debug purpose only. When this bit is set to 1 all FS/LS bus instances in park mode disabled.
14:9	RO	0x00	reserved

Bit	Attr	Reset Value	Description
12	RW	0x0	ext_cap_suppt_en External Extended Capability Support Enable When set, this field enables extended capabilities to be implemented outside the core. When the ExtCapSupEN is set and the Debug Capability is enabled, the Next Capability pointer in Debug Capability returns 16. A read to the first DWORD of the last internal extended capability (the "xHCI Supported Protocol Capability for USB 3.0" when the Debug Capability is not enabled) returns a value of 4 in the Next Capability Pointer field. This indicates to software that there is another capability four DWORDs after this capability (for example, at address N+16 where N is the address of this DWORD). If enabled, an external address decoder that snoops the xHC slave interface must be implemented. If it sees an access to N+16 or greater, the slave access is re-routed to a piece of hardware which returns the external capability pointer register of the new capability and also handles reads/writes to this new capability and the side effects. If disabled, a read to the first DWORD of the last internal extended capability returns 0 in the 'Next Capability Pointer' field. This indicates there are no more capabilities.
11	RW	0x0	insrt_extr_fsbodi Insert Extra Delay Between FS Bulk OUT. Some FS devices are slow to receive Bulk OUT data and can get stuck when there are consecutive Bulk OUT transactions with short inter-transaction delays. This bit is used to control whether the host inserts extra delay between consecutive Bulk OUT transactions to a FS Endpoint. 1'b0: Host doesn't insert extra delay between consecutive Bulk OUT transactions to a FS Endpoint. 1'b1: Host inserts about 12us extra delay between consecutive Bulk OUT transactions to a FS Endpoint to work around the device issue. Note: Setting this bit to one will reduce the Bulk OUT transfer performance for most of the FS devices.
10:9	RW	0x0	dtct Device Timeout Coarse Tuning. This field is a Host mode parameter which determines how long the host waits for a response from device before considering a timeout. The core first checks the DTCT value. If it is 0, then the timeout value is defined by the DTFT. If it is non-zero, then it uses the following timeout values: 2'b00: 0 usec -> use DTFT value instead 2'b01: 500 usec 2'b10: 1.5 msec 2'b11: 6.5 msec

Bit	Attr	Reset Value	Description
13:10	RW	0x9	usbtrdim USB 2.0 Turnaround Time. Sets the turnaround time in PHY clocks. Specifies the response time for a MAC request to the Packet FIFO Controller (PFC) to fetch data from the DFIFO (SPRAM). The following are the required values for the minimum SoC bus frequency of 60 MHz. USB turnaround time is a critical certification criteria when using long cables and five hub levels. The required values for this field: 4'h5: When the MAC interface is 16-bit UTMI+. 4'h9: When the MAC interface is 8-bit UTMI+/ULPI. If SoC bus clock is less than 60 MHz, and USB turnaround time is not critical, this field can be set to a larger value. Note: This field is valid only in device mode.
9	RW	0x0	xcvrdly Transceiver Delay. Enables a delay between the assertion of the UTMI/ULPI Transceiver Select signal (for HS) and the assertion of the TxValid signal during a HS Chirp. When this bit is set to 1, a delay (of approximately 2.5 us) is introduced from the time when the Transceiver Select is set to 2'b00 (HS) to the time the TxValid is driven to 0 for sending the chirp-K. This delay is required for some UTMI/ULPI PHYs. Note: If you enable the hibernation feature when the device core comes out of power-off, you must re-initialize this bit with the appropriate value because the core does not save and restore this bit value during hibernation. This bit is valid only in device mode.
8	RW	0x0	enblslpm Enable utmi_sleep_n and utmi_l1_suspend_n. The application uses this bit to control utmi_sleep_n and utmi_l1_suspend_n assertion to the PHY in the L1 state. 1'b0: utmi_sleep_n and utmi_l1_suspend_n assertion from the core is not transferred to the external PHY. 1'b1: utmi_sleep_n and utmi_l1_suspend_n assertion from the core is transferred to the external PHY. Note: This bit must be set high for Port0 if SNPS PHY is used. In Device mode - Before issuing any device endpoint command when operating in 2.0 speeds, disable this bit and enable it after the command completes. Without disabling this bit, if a command is issued when the device is in L1 state and if mac2_clk (utmi_clk/ulpi_clk) is gated off, the command will not get completed.
7	RO	0x0	physel USB 2.0 High-Speed PHY or USB 1.1 Full-Speed. 1'b0: USB 2.0 high-speed UTMI+ or ULPI PHY. 1'b1: USB 1.1 full-speed serial transceiver.

Bit	Attr	Reset Value	Description
6	RW	0x0	suspendusb20 Suspend USB2.0 HS/FS/LS PHY. When set, USB2.0 PHY enters Suspend mode if Suspend conditions are valid. If it is set to 1, then the application must clear this bit after power-on reset. Application needs to set it to 1 after the core initialization completes. For all other configurations, this bit can be set to 1 during core configuration. Note: In host mode, on reset, this bit is set to 1. Software can override this bit after reset. In device mode, before issuing any device endpoint command when operating in 2.0 speeds, disable this bit and enable it after the command completes. If you issue a command without disabling this bit when the device is in L2 state and if mac2_clk (utmi_clk/ulpi_clk) is gated off, the command will not get completed.
5	RO	0x0	reserved
4	RO	0x0	ulpi_utmi_sel ULPI or UTMI+ Select. 1'b0: UTMI+ Interface 1'b1: ULPI Interface
3	RW	0x0	phyif If UTMI+ is selected, the application uses this bit to configure the core to support a UTMI+ PHY with an 8- or 16-bit interface. 1'b0: 8 bits 1'b1: 16 bits
2:0	RW	0x0	tout_cal HS/FS Timeout Calibration. The number of PHY clocks, as indicated by the application in this field, is multiplied by a bit-time factor; this factor is added to the high-speed/full-speed interpacket timeout duration in the core to account for additional delays introduced by the PHY. This may be required, since the delay introduced by the PHY in generating the linestate condition may vary among PHYs. The USB standard timeout value for high-speed operation is 736 to 816 (inclusive) bit times. The USB standard timeout value for full-speed operation is 16 to 18 (inclusive) bit times. The application must program this field based on the speed of connection. The number of bit times added per PHY clock are: High-speed operation: One 30-MHz PHY clock = 16 bit times One 60-MHz PHY clock = 8 bit times Full-speed operation: One 30-MHz PHY clock = 0.4 bit times One 60-MHz PHY clock = 0.2 bit times

Bit	Attr	Reset Value	Description
30	RW	0x0	HstPrtCmpl This feature tests the PIPE PHY compliance patterns without having to have a test fixture on the USB 3.0 cable. This bit enables placing the SS port link into a compliance state. By default, this bit must be set to 1'b0. In compliance lab testing, the SS port link enters compliance after failing the first polling sequence after power on. Set this bit to 0, when you run compliance tests. The sequence for using this functionality is as follows: 1. Disconnect any plugged in devices. 2. Perform USBCMD.HCRST or power-on-chip reset. 3. Set PORTSC.PP=0. 4. Set GUSB3PIPECTL. HstPrtCmpl=1. This places the link into compliance state. To advance the compliance pattern, follow this sequence (toggle the set GUSB3PIPECTL. HstPrtCmpl): 1. Set GUSB3PIPECTL.HstPrtCmpl=0. 2. Set GUSB3PIPECTL.HstPrtCmpl=1. This advances the link to the next compliance pattern. To exit from the compliance state perform USBCMD.HCRST or power-on-chip reset.
29	RW	0x0	U2SSInactP3ok 1'b0: During link state U2/SS.Inactive, put PHY in P2 (Default) 1'b1: During link state U2/SS.Inactive, put PHY in P3
28	RW	0x0	DisRxDetP3 Disabled receiver detection in P3 1'b0: If PHY is in P3 and Core needs to perform receiver detection, The core performs receiver detection in P3. (Default) 1'b1: If PHY is in P3 and Core needs to perform receiver detection, The core changes the PHY power state to P2 and then performs receiver detection. After receiver detection, the cores changes PHY power state to P3.
27	RW	0x0	Ux_exit_in_Px 1'b0: The core does U1/U2/U3 exit in PHY power state P0 (default behavior). 1'b1: The core does U1/U2/U3 exit in PHY power state P1/P2/P3 respectively.
26	RW	0x0	ping_enhancement_en Ping Enhancement Enable When set, the Downstream port U1 ping receive timeout becomes 500 ms instead of 300 ms. Minimum Ping.LFPS receive duration is 8 ns (one mac3_clk). This field is valid for the downstream port only.
25	RW	0x0	u1u2exitfail_to_recov U1U2exitfail to Recovery When set, and U1/U2 LFPS handshake fails, the LTSSM transitions from U1/U2 to Recovery instead of SS Inactive. If Recovery fails, then the LTSSM can enter SS.Inactive. This is an enhancement only. It prevents interoperability issue if the remote link does not do proper handshake.

Bit	Attr	Reset Value	Description
24	RW	0x0	request_p1p2p3 Always Request P1/P2/P3 for U1/U2/U3 When set, the core always requests PHY power change from P0 to P1/P2/P3 during U0 to U1/U2/U3 transition. If this bit is 0, and immediate Ux exit (remotely initiated, or locally initiated) happens, the core does not request P1/P2/P3 power state change.
23	RW	0x0	StartRxDetU3RxDet Start Receiver Detection in U3/Rx.Detect (StartRxdetU3RxDet) If DWC_USB3_GUSB3PIPECTL_INIT[22] is set, and the link is in either U3 or Rx.Detect state, the core starts receiver detection on the rising edge of this bit. This can only be used for Downstream ports. This bit must be set to '0' for Upstream ports. This feature must not be enabled for normal operation.
22	RW	0x0	DisRxDetU3RxDet Disable Receiver Detection in U3/Rx.Det When set, the core does not handle receiver detection in either U3 or Rx.Detect states. DWC_USB3_GUSB3PIPECTL_INIT[23] must be used to start receiver detection manually. This bit can only be used for the downstream port. This bit must be set to 0 for Upstream ports. This feature must not be enabled for normal operation. If you have to use this feature, contact SNPS.
21:19	RW	0x0	DelayP1P2P3 Delay P1P2P3 Delay P0 to P1/P2/P3 request when entering U1/U2/U3 until (DWC_USB3_GUSB3PIPECTL_INIT[21:19]*8) 8B10B error occurs, or Pipe3_RxValid drops to 0. DWC_USB3_GUSB3PIPECTL_INIT[18] must be 1 to enable this functionality.
18	RW	0x0	DELAYP1TRANS DELAYP1TRANS Delay PHY power change from P0 to P1/P2/P3 when link state changing from U0 to U1/U2/U3 respectively. 1'b1: When entering U1/U2/U3, delay the transition to P1/P2/P3 until the pipe3 signals, Pipe3_RxElecIlde is 1 and pipe3_RxValid is 0 1'b0: When entering U1/U2/U3, transition to P1/P2/P3 without checking for Pipe3_RxElecIlde and pipe3_RxValid. Note: This bit must be set to '1' for SNPS PHY. It is also used by third-party SS PHY.
17	RO	0x0	reserved
16:15	RW	0x0	DATWIDTH 2'b00: 32 bits 2'b01: 16 bits 2'b10: 8 bits One clock after reset, these bits receive the value seen on the pipe3_DataBusWidth.
14	RW	0x0	AbortRxDetInU2 Abort Rx Detect in U2 (AbortRxDetInU2) When set, and the link state is U2, then the core will abort receiver detection if it receives U2 exit LFPS from the remote link partner. This bit is for the downstream port only.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
13	RW	0x0	SkipRxDet Skip Rx Detect: When set, the core skips Rx Detection if pipe3_RxElecIdle is low. Skip is defined as waiting for the appropriate timeout, then repeating the operation.
12	RW	0x0	LFPSP0Algn LFPS P0 Align When set: 1. The core deasserts LFPS transmission on the clock edge that it requests Phy power state 0 when exiting U1, U2, or U3 low power states. Otherwise, LFPS transmission is asserted one clock earlier. 2. The core requests symbol transmission two pipe3_rx_pclks periods after the PHY asserts PhyStatus as a result of the PHY switching from P1 or P2 state to P0 state.
11	RW	0x0	P3P2TranOK P3 P2 Transitions OK (P3P2TranOK) When set, the core transitions directly from Phy power state P2 to P3 or from state P3 to P2. When not set, P0 is always entered as an intermediate state during transitions between P2 and P3, as defined in the PIPE3 Specification. According to the PIPE3 Specification, any direct transition between P3 and P2 is illegal.
10	RW	0x0	P3ExSigP2 P3 Exit Signal in P2 When this bit is set, the core always changes the PHY power state to P2, before attempting a U3 exit handshake. This bit is used only for some non-SNPS PHYs that cannot do LFPS in P3. Note: This bit is used by third-party SS PHY. It must be set to '0' for SNPS PHY.
9	RW	0x0	LFPSFILTER LFPS Filter When set, filter LFPS reception with pipe3_RxValid in PHY power state P0, that is, ignore LFPS reception from the PHY unless both pipe3_Rxelecidle and pipe3_RxValid are deasserted.
8	RW	0x0	RX_DETECT_to_Polling_L RX_DETECT to Polling.LFPS Control 1'b0 (Default): Enables a 400us delay to start Polling LFPS after RX_DETECT. This allows VCM offset to settle to a proper level. 1'b1: Disables the 400us delay to start Polling LFPS after RX_DETECT. During controller certification with third party PHY it is observed that the PHY is not able to meet the Tx AC common mode voltage active (VTX-CM-ACPP_ACTIVE <100mv) if the link starts polling within 80us from the time rx.detect is performed. To meet this VTX-CM-ACPP_ACTIVE specification, the polling must be delayed further. If the PHY does not have issue then they can set this bit to 1 which allows polling to start within 80us.
7	RO	0x0	reserved

6:0	RW	0x00	gtxfifopridev Device TxFIFO priority. This register specifies the relative DMA priority level among the Device TXFIFOs (one per IN endpoint). Each register bit[n] controls the priority (1: high, 0: low) of each TXFIFO[n]. When multiple TXFIFOs compete for DMA service at a given time (that is, multiple TXQs contain TX DMA requests and their corresponding TXFIFOs have space available), the TX DMA arbiter grants access on a packet-basis in the following manner: 1. High-priority TXFIFOs are granted access using round-robin arbitration 2. Low-priority TXFIFOs are granted access using round-robin arbitration only after the high-priority TXFIFOs have no further processing to do (that is, either the TXQs are empty or the corresponding TXFIFOs are full). For scatter-gather packets, the arbiter grants successive DMA requests to the same FIFO until the entire packet is completed. When configuring periodic IN endpoints, software must set register bit[n]=1, where n is the TXFIFO assignment. This ensures that the DMA for isochronous or interrupt IN endpoints are prioritized over bulk or control IN endpoints. This register is present only when the core is configured to operate in the device mode. The register size corresponds to the number of Device IN endpoints.

Bit	Attr	Reset Value	Description
31	RW	0x0	gfladj_refclk_240mhzdecr_pls1 This field indicates that the decrement value that the controller applies for each ref_clk must be GFLADJ_REFCLK_240MHZ_DECR and GFLADJ_REFCLK_240MHZ_DECR +1 alternatively on each ref_clk. Set this bit to a 1 only if GFLADJ_REFCLK_LPM_SEL is set to 1 and the fractional component of 240/ref_frequency is greater than or equal to 0.5. Examples: If the ref_clk is 24 MHz then 1. GUCTL.REF_CLK_PERIOD = 41 2. GFLADJ.GFLADJ_REFCLK_240MHZ_DECR = (240/24) = 10 3. GFLADJ.GFLADJ_REFCLK_240MHZDECR_PLS1 = 0
30:24	RW	0x00	gfladj_refclk_240mhz_decr This field indicates the decrement value that the controller applies for each ref_clk in order to derive a frame timer in terms of a 240-MHz clock. This field must be programmed to a non-zero value only if GFLADJ_REFCLK_LPM_SEL is set to 1. The value is derived as follows: GFLADJ_REFCLK_240MHZ_DECR = 240/ref_clk_frequency Examples: If the ref_clk is 24 MHz then 1. GUCTL.REF_CLK_PERIOD = 41 2. GFLADJ.GFLADJ_REFCLK_240MHZ_DECR = 240/24 = 10
23	RW	0x0	gfladj_refclk_lpm_sel This bit enables the functionality of running SOF counters on the ref_clk. This bit must not be set to 1 if GCTL.SOFITPSYNC bit is set to 1. Similarly, if GFLADJ_REFCLK_LPM_SEL set to 1, GCTL.SOFITPSYNC must not be set to 1. Note that the ref_clk frequencies supported in this mode are 16/17/19.2/20/24/39.7/40 MHz. The utmi_clk[0] signal of the core must be connected to the FREECLK of the PHY. Note: If you set this bit to 1, the GUSB2PHYCFG.U2_FREECLK_EXISTS bit must be set to 0.
22	RO	0x0	reserved
21:8	RW	0x0000	gfladj_refclk_fladj This field indicates the frame length adjustment to be applied when SOF counter is running on the ref_clk. SOF interval when GLADJ.GFLADJ_REFCLK_LPM_SEL is set to 1. This field must be programmed to a non-zero value only if GFLADJ_REFCLK_LPM_SEL is set to 1 or GCTL.SOFITPSYNC is set to 1. The value is derived as follows: FLADJ_REF_CLK_FLADJ=((125000/ref_clk_period_integer)-(125000/ref_clk_period)) * ref_clk_period where: 1. The ref_clk_period_integer is the integer value of the ref_clk period got by truncating the decimal (fractional) value that is programmed in the GUCTL.REF_CLK_PERIOD field. 2. The ref_clk_period is the ref_clk period including the fractional value. Examples: If the ref_clk is 24 MHz then 1. GUCTL.REF_CLK_PERIOD = 41 2. GFLADJ.GLADJ_REFCLK_FLADJ = ((125000/41)-(125000/41.6666))*41.6666 = 2032 (ignoring the fractional value).

Bit	Attr	Reset Value	Description
7	RW	0x0	gfladj_30mhz_sdbnd_sel This field selects whether to use the input signal fladj_30mhz_reg or the GFLADJ.GFLADJ_30MHZ to adjust the frame length for the SOF. When this bit is set to: 1'b1: the controller uses the register field GFLADJ.GFLADJ_30MHZ value 1'b0: the controller uses the input signal fladj_30mhz_reg value.
6	RO	0x0	reserved
5:0	RW	0x00	gfadj_30mhz This field indicates the value that is used for frame length adjustment instead of considering from the sideband input signal fladj_30mhz_reg. This enables post-silicon frame length adjustment in case the input signal fladj_30mhz_reg is connected to a wrong value or is not valid. For details on how to set this value, refer to section 5.2.4, "Frame Length Adjustment Register (FLADJ)," of the xHCI Specification.

Bit	Attr	Reset Value	Description
31	RW	0x0	run_stop The software writes 1 to this bit to start the device controller operation. To stop the device controller operation, the software must remove any active transfers and write 0 to this bit. When the controller is stopped, it sets the DSTS.DevCtrlHlt bit when the core is idle and the lower layer finishes the disconnect process. The Run/Stop bit must be used in following cases as specified: 1. After power-on reset and CSR initialization, the software must write 1 to this bit to start the device controller. The controller does not signal connect to the host until this bit is set. 2. The software uses this bit to control the device controller to perform a soft disconnect. When the software writes 0 to this bit, the host does not see that the device is connected. The device controller stays in the disconnected state until the software writes 1 to this bit. The minimum duration of keeping this bit cleared is specified in the Note below. If the software attempts a connect after the soft disconnect or detects a disconnect event, it must set DCTL[8:5] to 5 before reasserting the Run/Stop bit. 3. When the USB is in a lower power state and the Two Power Rails configuration is selected, software writes 0 to this bit to indicate that it is going to turn off the Core Power Rail. After the software turns on the Core Power Rail again and re-initializes the device controller, it must set this bit to start the device controller. Note: The following is the minimum duration under various conditions for which the soft disconnect (SftDiscon) bit must be set for the USB host to detect a device disconnect: 10ms: For high-speed, when the device state is Suspended, Idle, or not Idle/Suspended (performing transactions); For full-speed/low-speed, when the device state is Suspended, Idle, or not Idle/Suspended (performing transactions). To accommodate clock jitter, it is recommended that the application add extra delay to the specified minimum duration.
30	R/WSC	0x0	csftrst Core Soft Reset. Reset all clock domains as follows: 1. This bit clears the interrupts and all the CSRs except GSTS, GSNPSID, GGPIO, GUID, GUSB2PHYCFGn registers, GUSB3PIPECTLn registers, DCFG, DCTL, DEVTEN, and DSTS registers. 2. All module state machines (except the SoC Bus Slave Unit) are reset to the IDLE state, and all the TxFIFOs and the RxFIFO are flushed. 3. Any transactions on the SoC bus Master are terminated as soon as possible, after gracefully completing the last data phase of a SoC bus transfer. Any transactions on the USB are terminated immediately. The application can write this bit at any time to reset the core. This is a self-clearing bit; the core clears this bit after all necessary logic is reset in the core, which may take several clocks depending on the core's current state. Once this bit is cleared, the software must wait at least 3 PHY clocks before accessing the PHY domain (synchronization delay). Typically, software reset is used during software development and also when you dynamically change the PHY selection bits in the

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
			USB configuration registers listed above. When you change the PHY, the corresponding clock for the PHY is selected and used in the PHY domain. Once a new clock is selected, the PHY domain must be reset for proper operation.
29	RO	0x0	reserved
28:24	RW	0x00	hirdthres HIRD Threshold. The core asserts output signals utmi_l1_suspend_n and utmi_sleep_n on the basis of this signal: The core asserts utmi_l1_suspend_n to put the PHY into Deep Low-Power mode in L1 when both of the following are true: 1. HIRD value is greater than or equal to the value in DCTL.HIRD_Thres[3:0] 2. HIRD_Thres[4] is set to 1'b1. The core asserts utmi_sleep_n on L1 when one of the following is true: 1. If the HIRD value is less than HIRD_Thres[3:0] or 2. HIRD_Thres[4] is set to 1'b0. Note: This field must be set to '0' during SuperSpeed mode of operation.
23:20	RW	0xf	lpm_nyet_thres LPM NYET Threshold Handshake response to LPM token specified by device application. Response depends on DCFG.LPMCap. DCFG.LPMCap is 1'b0 - The core always responds with Timeout (that is, no response). DCFG.LPMCap is 1'b1 - The core responds with an ACK on successful LPM transaction, which requires that all of the following are satisfied: 1. There are no PID or CRC5 errors in both the EXT token and the LPM token (if not true, inactivity results in a timeout ERROR). 2. No data is pending in the Transmit FIFO and OUT endpoints not in flow controlled state (else NYET). 3. The BESL value in the LPM token is less than or equal to LPM_NYET_thres[3:0].
19	RW	0x0	keep_connect When 1, this bit enables the save and restore programming model by preventing the core from disconnecting from the host when DCTL.RunStop is set to 0. The device core disconnects from the host when DCTL.RunStop is set to 0. This bit indicates whether to preserve this behavior (0), or if the core must not disconnect when RunStop is set to 0 (1).
18	RW	0x0	l1_hibernation_en When this bit is set along with KeepConnect, the device core generates a Hibernation Request Event if L1 is enabled and the HIRD value in the LPM token is larger than the threshold programmed in DCTL.HIRD_Thres. The core does not exit the LPM L1 state until software writes Recovery into the DCTL.ULStChngReq field. This prevents corner cases where the device is entering hibernation at the same time the host is attempting to exit L1.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
29	RW	0x0	dcnrd Device Controller Not Ready. The bit indicates that the core is in the process of completing the state transitions after exiting from hibernation. To complete the state transitions, it takes 256 bus clock cycles from the time DCTL[31].Run/Stop is set. During hibernation, if the UTMI/ULPI PHY is in suspended state, then the 256-bus clock cycle delay starts after the PHY exited suspended state. Software must set DCTL[31].Run/Stop to 1 and wait for this bit to be de-asserted to zero before processing DSTS.USBLnkSt.
28:26	RO	0x0	reserved
25	RW	0x0	rss Restore State Status. This bit is similar to the USBSTS.RSS in host mode. When the controller finishes the restore process, it completes the command by setting DSTS.RSS to 0.
24	RO	0x0	sss Save State Status. This bit is similar to the USBSTS.SSS in host mode. When the controller has finished the save process, it completes the command by setting DSTS.SSS to 0.
23	RO	0x0	coreidle Core Idle. The bit indicates that the core finished transferring all RxFIFO data to system memory, writing out all completed descriptors, and all Event Counts are zero. Note: While testing for Reset values, mask out the read value. This bit represents the changing state of the core and does not hold a static value.
22	RO	0x1	devctrlhlt Device Controller Halted. This bit is set to 0 when the Run/Stop bit in the DCTL register is set to 1. The core sets this bit to 1 when, after SW sets Run/Stop to 0, the core is idle and the lower layer finishes the disconnect process. When Halted=1, the core does not generate Device events. Note: The core does not set this bit to 1 if GEVNTCOUNTn has some valid value. Software needs to acknowledge the events that are generated (by writing to GEVNTCOUNTn) while it is waiting for this bit to be set to 1.

13.5 Application Notes

13.5.1 Some Settings About USB3OTG0

- **USB3 mode initial sequence**

In this application USBDP PHY will use 24Mhz or 26Mhz reference clock, some initial sequence should be set and USB mode should be configured before working. Please refer to USBDP PHY section.

- **Power Down Mode**

When no transfer happened, PD_USB can be power down in application. At this time the PowerDown signal to USBDP PHY PIPE interface will be clamped to 3'b3. But there is also a MUX near USBDP PHY which could choose form GRF. Also, RxTermination, TxElecIdle and TxDetectRxLoopbx can also be control by GRF, this could be found in USBDPPHY_GRF_CON3 in GRF section.

If USB and DP not be used, USBDPPHY could also be power down, and before power down, USBDPPHY_GRF_CON2[15] will use to clamp the PHY output signal.

- **PhyStatus in PIPE Interface for USB2 only**

If only USB2 is used and USBDP PHY initial sequence not correctly processes, the PIPE interface signal PhyStatus may be set to 1'b1,
USB_GRF_USB3OTG0_CON1/PHP_GRF_USB3OTG1_CON1[3:2] can be set to control PhyStatus.

13.5.2 USB3OTG1 mode setting

USB3.0 PHY is combo with PCIE, so you must set some GRF to set USB mode.

- Set COMBO_PIPE_PHY_GRF_PIPE_CON0[3:2] to 1'b1 to select USB mode.
- Set COMBO_PIPE_PHY_GRF_PIPE_CON2[12] and [15] to 1'b0. This will select TxElecidle and TxCompliance form controller.

13.5.3 Battery Charge

The USB2.0 PHY supports battery charger detection to enable device draw increased

current from VBUS for charging and/or powering up from dedicated charging ports or charging downstream ports.
The related signals with GRF are following:

Table 13-1 USB2PHY Battery Charging GRF Description

GRF	Description
USB2PHY_GRF_CON2[5]	CHRGSEL: This signal selects whether the Battery Charger circuit sets voltage sourcing on the DP line and sensing on the DM line or voltage sourcing on DM and sensing on DP.
USB2PHY_GRF_CON2[6]	VDATDETENB: This signal activates the Battery Charger comparator and enables detection of the DP and DM lines according to the Battery Charging specification.
USB2PHY_GRF_CON2[7]	VDATSRCENB: This signal activates the voltage sourcing on the DP or DM line.
USB2PHY_GRF_STATUS0[0]	CHGDET: This signal is the battery charge detection (VDAT_REF) comparator output.
USB2PHY_GRF_STATUS0[1]	FSVPLUS: This signal is the DP FS/LS single ended receiver output, which is also the VLGC output.
USB2PHY_GRF_STATUS0[2]	FSVMINUS: This signal is the DM FS/LS single ended receiver output, which is also the VLGC output.
USB2PHY_GRF_STATUS0[11]	OTGSESSVLD0: This signal is the VBUS session valid detection and can be used by a portable device to detect the VBUS voltage from the host or charger port.

Next lists the detection flow.

PHY is operating as a host CDP that detects a connect from the PD D+ pullup.	1	1	0	X	X	1	0

13.5.4 USB1 Limit

USB1 cannot work when COMBO_PIPE_PHY1 is used as PCIe or SATA. This limit includes USB3.0 and USB2.0 mode.

13.5.5 OTG Programming Model

When detect ID change event (see VOGRF) or VBUS change event (see VOGRF) after disconnect, it means a USB2.0/3.0 OTG A device or B device may connect, then check status of ID (see VOGRF). If ID==0, it will work as A device, then follow host programming flow; if ID==1, it will work as B device, then it follows device programming flow.
Note: USB3OTG doesn’t support host/device mode swapping through HNP and RSP.

Chapter 14 PCIe Controller

14.1 Overview

The PCI Express (PCIe) is a high performance, general purpose I/O interconnect defined for a wide variety of future computing and communication platforms. The PCIe designed to be used as a general-purpose serial I/O interconnect in multiple market segments, including desktop, mobile, server, storage, and embedded communications. The PCIe controller implements the three PCI Express protocol layers (Transaction layer, Data Link layer, and the MAC portion of the physical layer). It also implements the application-dependent functionality of the PCI Express Transaction Layer for packet transmission, which is located between application logic and the PCI Express protocol layers.

The PCIe controller is compliant with PCI Express Specifications 1.1, 2.1. The PCIe controller subsystem consists of 1 controller, refer to Block Diagram for details.

PCIe controller subsystem supports the following features:
- Compatible with PCI Express Base Specification Revision 2.1
- Including 2 PCIe controller
  - RC mode only
    - Maximum payload size is 128 bytes
    - 8 ATU inbound regions, 8 ATU outbound regions
    - Up to Gen2 X 1 link when connecting with Combo PIPE PHY
- The following optional features of the specification
  - Alternative Routing-ID Interpretation (ARI)
  - TLP Prefix
  - Dynamic Power Allocation (DPA)
  - L1 Substates (L1SS)
  - PCI Express Active State Power Management (ASPM)
  - PCI Express Advanced Error Reporting (AER) with Multiple Header Logging
- Support Latency Tolerance Reporting (LTR)
- Support Optimized Buffer Flush and Fill (OBFF)
- Internal Datapath Operating at 62.5 MHz, 125 MHz
- Advanced Power and Clock Management
- Internal Address Translation Unit
- Integrated MSI/MSI-X Receiver Module
- RAS DES (Debug, Error Injection, and Statistics)
- ECRC Generation and Checking
- Store-and-forward Queue Modes for Rx TLPs
- Configurable Filtering Rules for Posted, Non-posted, and Completion Traffic
- Configurable BAR Filtering, I/O Filtering, Configuration Filtering and Completion Lookup/Timeout
- Three Application Transmit Clients
- MSI with Per-Vector Masking (PVM), Extended message data for MSI
- MSI-X with Per-Vector Masking (PVM)

14.2 Block Diagram

PCIe comprises with:
- APB: APB Interface
- AXI_S: AXI Slave Interface
- AXI_M: AXI Master Interface
- AXI_DBI: AXI Slave Interface for configuration
- Client: Client Logic
- CLKRST: Clock and Reset related logic
- Memory: SRAMs and Buffers
- AMBA Bridge: AXI to Core Bridge
- PCIe Core: PCIe Controller Core

Copyright © 2024 Rockchip Electronics Co., Ltd.

- PM: Power Management Unit
- Combo PIPE PHY

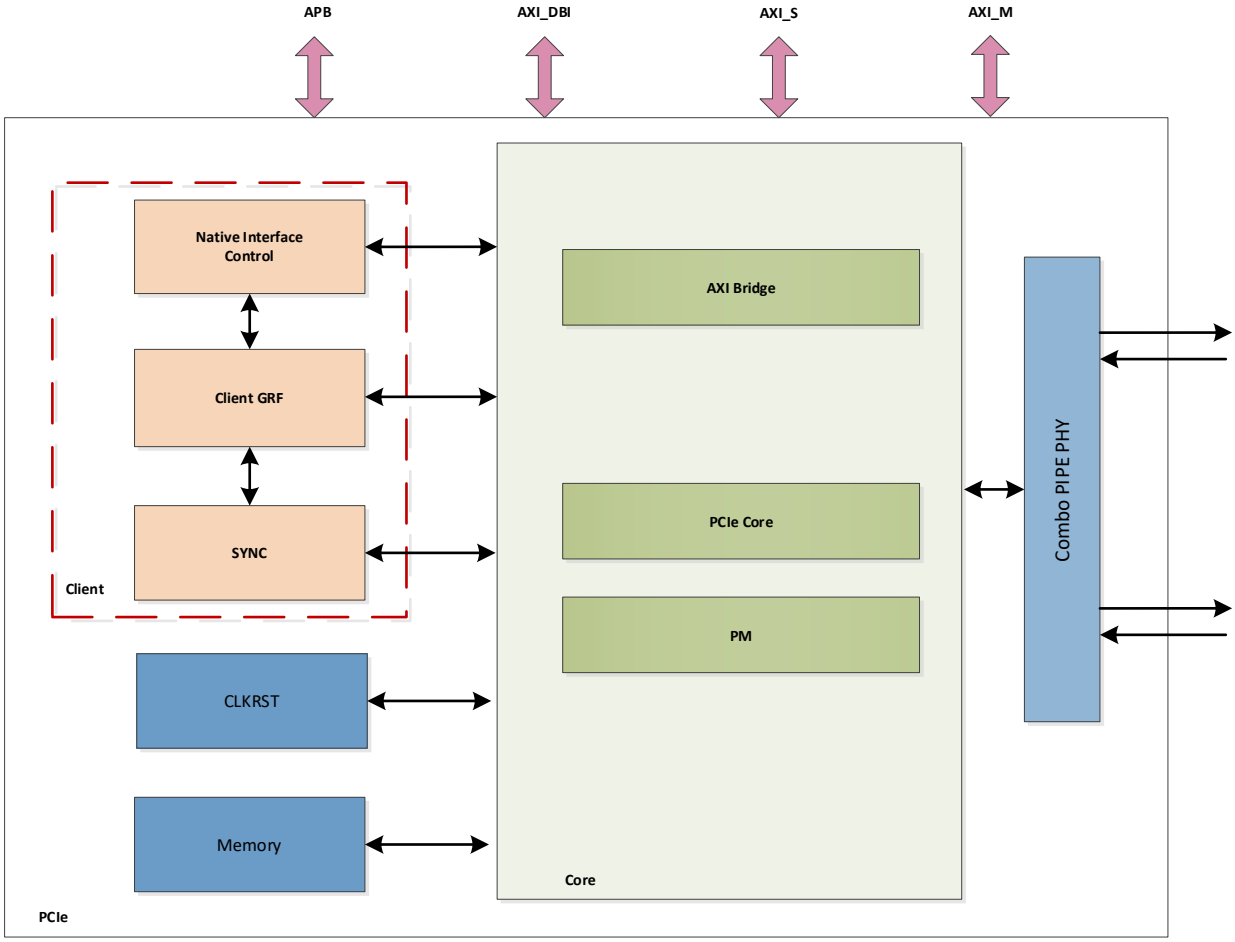

Fig. 14-1 PCIe Block Diagram

Block function description will be discussed in next section.

14.3 Function Description

14.3.1 Application Interface and AXI Bridge

Application Interface comprises with four standard interfaces: one AXI master interface, two AXI slave interface and one APB interface. These interfaces bridging capability for directly adding a PCI Express link to an AXI system fabric.

The AXI bridge module acts as a bridge between the standard AXI interfaces and the PCIe controller native interfaces. The bridge interconnects the AXI interfaces within an AXI-embedded system with a remote PCIe link, as either a root complex port or as an endpoint port.

The AXI master interfaces enable a remote PCIe device to read and write to an AXI slave (in System Interface) connected to the AXI bridge. The AXI link slave interface enables an AXI master (in System Interface) to read and write through the AXI bridge to a remote PCIe device. The DBI slave enables an AXI master (in System Interface) to access the controller's registers. The APB enables Application to access the Client registers.

14.3.2 Client

Client Logic Consists of some additional logic used for application to interact with PCIe Controller. For example, applications can access client registers to send/receive PCIe Message, request to enter/exit PM state, deal with interrupts, configure some basic operation mode, read some basic debug information, and so on. For more details, please

Copyright © 2024 Rockchip Electronics Co., Ltd.

refer to Client registers description and application notes for more information.

14.3.3 CXPL

PCIe Core deal with the PCIe protocol, and consists of three main modules:

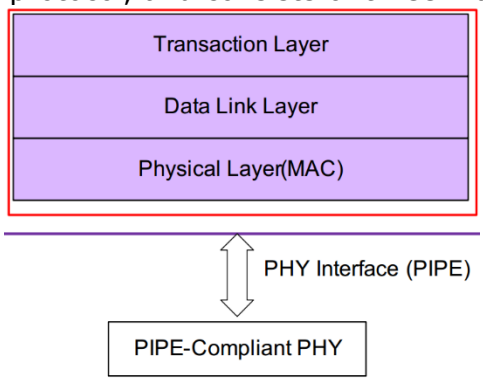

Fig. 14-2 PCIe Core Architecture Overview

The PCIe Core implements the basic functionality for the PCI Express physical, link, and transaction layers. This module implements a large part of the transaction layer logic, all of the data link layer logic, and the MAC portion of the physical layer, including the link training and status state machine (LTSSM). The Core connects to the external PHY through the standard PIPE interface.

14.3.4 PMC

PCIe Controller support PCIe ASPM, L1 Substate and PCI PM. For proper understanding of PCIe Power Management, you should be familiar with Power Management of the PCI Express Base Specification, and PCI-SIG Engineering Change Notice ECN L1 Substates with CLKREQ#. For application details, please refer to Application Notes for more information.

14.3.5 XADM

Transmit Application-Dependent Module (XADM) implements the application-specific functionality of the PCI Express transaction layer for packet transmission. Its functions include:

- TLP Arbitration
- TLP Formation
- Flow Control (FC) Credit checking

The transmit path uses a cut-through architecture. It does not implement transmit buffering/queues (other than the retry buffer). The controller maintains an internal Target Completion Lookup Table to store certain TLP header information from the Rx request.

14.3.6 RADM

Receive Application-Dependent Module (RADM) implements application-specific functionality of the PCI Express transaction layer for packet reception. Its functions include:

- Sorting/filtering of received TLPs. The filtering rules and routing are configurable.
- Buffering and queuing of the received TLPs.
- Routing of received TLP to the controller’s receive interfaces.

The RADM maintains a Receive Completion Lookup Table (LUT) for completion tracking and completion-timeout monitoring of Tx non-posted requests. It indicates a timeout when an expected Rx completion does not arrive within the timeout period.

14.3.7 CDM

Configuration-Dependent Module (CDM) implements:

- Standard PCI Express configuration space
- Controller-specific register space (Port Logic Registers)
-

14.4.2.3 Detail Registers Description

PCIE_CLIENT_GENERAL_CON

Address: **Operational Base** + offset (0x0000)

Bit	Attr	Reset Value	Description
31:16	WO	0x0000	write_enable Write enable for lower 16 bits, each bit is individual. 1'b0: Write access disable 1'b1: Write access enable
15	RO	0x0	reserved
14	RW	0x0	mem_auto_clk_gating_disable Control the memory auto clock gating when it is inactive. 1'b0: Auto gating enable 1'b1: Auto gating disable
13	RW	0x0	link_req_rst_grt_sel Link down reset request grant control select: 1'b1: From client grf GENERAL_CON bit 3 1'b0: From pcie grf PCIE_CON0 bit 2 Reserved after r5p6 (version 50600).
12	R/WSC	0x0	app_hdr_valid Alias "app_err_report" in old client version. One-clock-cycle pulse indicating that the data app_hdr_log, app_err_bus, app_err_func_num, and app_tlp_prfx_log is valid. Set 1 to report application error to controller. It is a self-clear bit to generate a pulse to controller. Application should provide error information in VEN_ERR_INFOx registers before setting this bit.
11	RW	0x0	app_sris_mode SRIS operating mode 1'b0: non-SRIS mode 1'b1: SRIS mode

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
10	RW	0x0	app_dbi_ro_wr_disable DBI Read-only Write Disable 1'b0: MISC_CONTROL_1_OFF.DBI_RO_WR_EN register field is read-write. 1'b1: MISC_CONTROL_1_OFF.DBI_RO_WR_EN register field is forced to 0 and is read-only
9	RW	0x0	tx_lane_flip_en Performs manual lane reversal for transmit lanes. For use whenautomatic lane reversal does not occur because lane 0 is not detected. In most cases, tx_lane_flip_en should be wired to a static value at thechip level. For more information, see 'Lane Reversal and Broken Lanes'. This signal is only used in Conventional PCIe mode. When in M-PCIe mode, mpcie_tx_lane_flip_en is used. 1'b0: Disable 1'b1: Enable
8	RW	0x0	rx_lane_flip_en Performs manual lane reversal for receive lanes. For use when automatic lane reversal does not occur because lane 0 is not detected. In most cases, rx_lane_flip_en should be wired to a static value at the chip level. For more information, see 'Lane Reversal and Broken Lanes'. This signal is only used in Conventional PCIe mode. When in M-PCIe mode, mpcie_rx_lane_flip_en is used. 1'b0: Disable 1'b1: Enable
7:4	RW	0x0	device_type Device/port type. Indicates the specific type of this PCI Express function. It is also used to set the 'Device/Port Type' field of the 'PCI Express Capabilities Register'. The controller uses this input to determine the operating mode of the controller at run time. Defined encodings are: 4'h0: PCI Express endpoint 4'h1: Legacy PCI Express endpoint 4'h4: Root port of PCI Express root complex
3	RW	0x0	link_req_rst_grt Link down reset request grant control. 1'b0: Disable link down reset request grant 1'b1: Enable link down reset request grant Reserved after r5p6(version 50600).
2	RW	0x0	app_ltssm_enable Driven low by your application after cold, warm, or hot reset to hold the LTSSM in the Detect state until your application is ready for the link training to begin. When your application has finished reprogramming the controller configuration registers using the DBI, it asserts app_ltssm_enable to allow the LTSSM to continue link establishment. Can also be used to delay hot resetting of the controller until you have read out any register status.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
1	RW	0x0	app_req_retry_en Provides a capability to defer incoming configuration requests until initialization is complete. When app_req_retry_en is asserted, the controller completes incoming configuration requests with a configuration request retry status. Other incoming requests are not affected. When the Readiness Notification mechanism is supported, DRS messaging is blocked when app_req_retry_en=1. When app_req_retry_en=0 and app_drs_ready=1, the controller autonomously transmits a DRS message when the link transitions from DL_Down to DL_Up.
0	R/WSC	0x0	app_init_rst Request from your application to send a hot reset to the upstream port. The hot reset request is sent when a single cycle pulse is applied to this pin. In an upstream port, you should set this input to '0'.

PCIE_CLIENT_INTR_STATUS_MSG_RX

Address: **Operational Base** + offset (0x0004)

Bit	Attr	Reset Value	Description
31:15	RO	0x00000	reserved
14	W1C	0x0	obff_cpu_active_int Interrupt indicates that the controller received an 'CPU Active' OBFF message. 1'b0: No interrupt 1'b1: Interrupt EP only. One-clock-cycle pulse that indicates that the controller received a 'CPU Active' OBFF message. When RX_TLP > 1 and when two messages of the same type are received in the same clock cycle (back-to-back), then no separate indication is given for the second message. Only usable in an upstream port.
13	W1C	0x0	obff_obff_int Interrupt indicates that the controller received an 'OBFF' OBFF message. 1'b0: No interrupt 1'b1: Interrupt EP only. if cfg_obff_en is not equal to 2'b11, then radm_msg_obff One-clock-cycle pulse that indicates that the controller received an 'OBFF' OBFF message. When RX_TLP > 1 and when two messages of the same type are received in the same clock cycle (back-to-back), then no separate indication is given for the second message. Only usable in an upstream port.
12	W1C	0x0	obff_idle_int Interrupt indicates that the controller received an 'IDLE' OBFF message. 1'b0: No interrupt 1'b1: Interrupt EP only. if cfg_obff_en is not equal to 2'b11, then radm_msg_idle One-clock-cycle pulse that indicates that the controller received an 'IDLE' OBFF message. When RX_TLP > 1 and when two messages of the same type are received in the same clock cycle (back-to-back), then no separate indication is given for the second message. Only usable in an upstream port.

Bit	Attr	Reset Value	Description
1	W1C	0x0	aer_rc_err_msi The controller asserts cfg_aer_rc_err_msi for one clock cycle when all of the following conditions are true: 1. MSI or MSI-X is enabled. 2. A reported error condition causes a bit to be set in the Root Error Status register. 3. The associated error message reporting enable bit is set in the Root Error Command register. The controller does not check if the associated MSI vector (asserted cfg_aer_int_msg_num) is unmasked. It is up to the application to check whether the vector is masked or unmasked. RC mode only.
0	RO	0x0	aer_rc_err_int Asserted when a reported error condition causes a bit to be set in the Root Error Status register and the associated error message reporting enable bit is set in the Root Error Command register. cfg_aer_rc_err_int is set when the RC internally generates an error or when an error message is received by the RC. Because the RC itself generates it, this needs to be propagated up to the system software which would then need to read the error registers to see which error occurred. Note: This signal is used when MSI/MSI-X is NOT enabled; otherwise see cfg_aer_rc_err_msi. RC mode only.

Bit	Attr	Reset Value	Description
12	W1C	0x0	dpa_sub_upd_int DPA Substate-Updated Indication Signal Bus. The controller asserts "dpa_substate_update" for one core_clk cycle when the Substate Control field of the DPA Control Register has been updated with a new value for the associated function. The controller asserts it when the updated value of the Substate Control field does not match the Substate Status field of the Status Register when the Substate Control Enable bit field of the Status Register is set to "1". Note: Your application logic is required to do the following: 1. Detect the one cycle pulse on the signal for the relevant function. 2. Read the function's substate control register to determine the software's target substate (transition). 3. Read the function's transition latency value, unit, and indicator. Calculate the maximum transition latency for the substate transition. 4. Execute the substate transition and complete it within the maximum transition latency. 5. Update the substate status after completing the transition through a DBI write. The controller updates the substate status during the substate transition if the transition is from a lower power substate to a higher; the status is the higher power substate during the substate transition.
11	RO	0x0	edma_rd_int DMA read channel interrupt. Indicates that the DMA transfer has completed or that an error has occurred. 1'b0: No interrupt 1'b1: Interrupt
10	RO	0x0	edma_wr_int DMA write channel interrupt. Indicates that the DMA transfer has completed or that an error has occurred. This is a level interrupt. 1'b0: No interrupt 1'b1: Interrupt
9	W1C	0x0	bw_mgt_msi The controller sets this pin when following conditions are true: 1. MSI or MSI-X is enabled. 2. The Link Bandwidth Management Status register (Link Control Status register bit 14) is updated 3. The Link Bandwidth Management Interrupt Enable (Link Control register bit 10) is set. reuse-pragma begin Attr Description This pin is set as a notification when the Link Bandwidth Management Status register (Link Status register bit 14) is updated and the Link Bandwidth Management Interrupt Enable (Link Control register bit 10) is set and in addition the msi or msix are enabled . This bit is not applicable to, and is reserved, for endpoint devices and upstream ports of Switches. For upstream port: Reserved. <ct:CX_IS_EP>Reserved.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
8	RO	0x0	bw_mgt_int The controller asserts cfg_bw_mgt_int when all of the following conditions are true: 1. The INTx Assertion Disable bit in the Command register is 0, and 2. The Bandwidth Management Interrupt Enable bit in the Link Control register is set to 1, and 3. The Bandwidth Management Interrupt Status bit in the Link Status register is set to 1. The cfg_bw_mgt_msi output is a pulse signal (only asserted for one clock cycle); but cfg_bw_mgt_int is a level signal. For upstream port: Reserved.
7	W1C	0x0	link_auto_bw_msi The controller sets this pin when following conditions are true: 1. MSI or MSI-X is enabled. 2. The Link Autonomous Bandwidth Status register (Link Status register bit 15) is updated. 3. The Link Autonomous Bandwidth Interrupt Enable (Link Control register bit 11) is set. The controller does not check if the associated MSI vector (asserted cfg_pcie_cap_int_msg_num) is unmasked. It is up to the application to check whether the vector is masked or unmasked. For upstream port: Reserved. <ct:CX_IS_EP>Reserved.
6	RO	0x0	link_auto_bw_int The controller asserts cfg_link_auto_bw_int when all of the following conditions are true: 1. The INTx assertion disable bit in the Command register is 0, and 2. The Link Autonomous Bandwidth Interrupt Enable bit in the Link Control register is set to 1, and 3. The Link Autonomous Bandwidth Interrupt Status bit in the Link Status register is set to 1. The cfg_link_auto_bw_msi output is a pulse signal (only asserted for one clock cycle); but cfg_link_auto_bw_int is a level signal. For upstream port: Reserved.
5	W1C	0x0	hp_msi The controller asserts hp_msi (as a one-cycle pulse) when the logical AND of the following conditions transitions from false to true: 1. MSI or MSI-X is enabled. 2. Hot-Plug interrupts are enabled in the Slot Control register. 3. Any bit in the Slot Status register transitions from 0 to 1 and the associated event notification is enabled in the Slot Control register. There is one bit of hp_int for each configured function. The controller pulses the hp_msi output only when any of the hot plug status bits change from 0 to 1 (as is hp_pme).

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
4	RO	0x0	hp_int The controller asserts hp_int when all of the following conditions are true: 1. The INTx Assertion Disable bit in the Command register is 0. 2. Hot-Plug interrupts are enabled in the Slot Control register. 3. Any bit in the Slot Status register is equal to 1, and the associated event notification is enabled in the Slot Control register. There is one bit of hp_int for each configured function.
3	W1C	0x0	hp_pme_int The controller asserts hp_pme when all of the following conditions are true: 1. The PME Enable bit in the Power Management Control and Status register is set to 1. 2. Any bit in the Slot Status register transitions from 0 to 1 and the associated event notification is enabled in the Slot Control register. The controller does not check if the PM state is D1, D2, or D3hot. It is up to your application to check the value pm_dstate to make sure the device is in D1, D2, or D3hot. There is one bit of hp_pme for each configured function. The controller pulses the hp_pme output only when any hot plug status bit changes from 0 to 1 (as is hp_msi). hp_int stays asserted as long as the status bit is set. In addition, it asserts hp_pme only if PME is enabled, but it does not matter if hot-plug interrupts are enabled.
2	W1C	0x0	link_req_rst_not_int Early version of the link_req_rst_not signal. For more information, see the 'Warm and Hot Resets' section in the Architecture chapter of the Databook. smlh_req_rst_not. 1'b0: No interrupt 1'b1: Interrupt

13	RW	0x0	clk_req_n_con Valid when clk_req_n_bypass set to 1. 1'b1: Tristate CLKREQ# 1'b0: Pull down CLKREQ#
12	RW	0x0	clk_req_n_bypass 1'b0: clk_req_n does not bypass, CLKREQ# driven by controller 1'b1: clk_req_n bypass, CLKREQ# driven by bit 13 of POWER_CON
11:10	RW	0x0	p2_cpm_disable 2'b00: When phy in P2 power state, enable clock PM for both L1 and L2 2'b01: When phy in P2 power state, enable clock PM for L2 but disable for L1 2'b10: When phy in P2 power state, disable clock PM for L2 but enable for L1 2'b11: When phy in P2 power state, disable clock PM for both L1 and L2 Reserved after r5p6(version 50600).
9	RW	0x0	app_clk_pm_en Clock PM feature enabled by application. Used to inhibit the programming of the Clock PM in Link Control Register. For more information, see 'L1 with Clock PM (L1 with REFCLK removal/PLL Off)'.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
8	RW	0x0	sys_aux_pwr_det Auxiliary Power Detected. Used to report to the host software that auxiliary power (Vaux) is present. 1'b0: Auxiliary power is not present 1'b1: Auxiliary power is present
7	RO	0x0	reserved
6	RW	0x0	app_l1sub_disable The application can set this input to 1'b1 to prevent entry to L1 Sub-states. This pin is used to gate the L1 sub-state enable bits from the L1 PM Substates Control 1 Register.
5	RW	0x0	app_xfer_pending Indicates that your application has transfers pending. 1'b1: There are transactions outside the controller that the controller needs to transmit. For EP mode, prevents generation of requests to enter L1. Triggers exit if already in L1. For RC mode, triggers exit if already in L1. 1'b0: There are no transactions outside the controller. Indicates that your application has transfers pending and prevents the controller from entering L1. If the entry into L1 is already in progress, assertion of app_xfer_pending causes an exit from L1. This is a level signal used to inform the controller about the state of external queues and pipeline stages that contain transactions to be transmitted by the controller. The controller uses this information to determine when to enter/exit L1. When this signal is asserted, it indicates that there are transactions outside the controller that the controller needs to transmit. When de-asserted, it indicates that there are no transactions outside the controller. The controller responds to an assertion on this signal as follows: 1. Upstream Ports: Prevents generation of requests to enter L1. Triggers exit if already in L1. 2. Downstream Ports: Triggers exit if already in L1. You can instruct the controller to exit L1 by asserting either or both of app_xfer_pending and app_req_exit_l1. The controller only samples app_req_exit_l1 when the controller is already in the L1 state.
4	R/WSC	0x0	app_req_exit_l1 1'b0: Self clear to generate a pulse to controller. 1'b1: Application request to Exit L1. Application request to Exit L1. Request from your application to exit L1. It is only effective when L1 is enabled.
3	RW	0x1	app_ready_entr_l23 1'b0: Application not ready to enter L23. 1'b1: Application ready to enter L23. Application Ready to Enter L23. Indication from your application that it is ready to enter the L23 state. The app_ready_entr_l23 signal is provided for applications that must control L23 entry (in case certain tasks must be performed before going into L23). The controller delays sending PM_Enter_L23 (in response to PM_Turn_Off) until this signal becomes active. When this signal has been asserted by the application, it must be kept asserted until L2 entry has completed. Hardwire to 1 for applications that do not require this feature. Note: The controller ignores this input in RC mode.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
2	R/WSC	0x0	app_req_entr_l1 Application request to Enter L1 ASPM state. 1'b0: Self clear to generate a pulse to controller 1'b1: Application request to enter L1 state Application request to Enter L1 ASPM state. The app_req_entr_l1 signal is for use by applications that need to control L1 entry instead of using the L1 entry timer as defined in the PCI Express Specification. It is only effective when L1 is enabled. The controller latches this request when in L0 or L0s; to be acted upon later. Note: The controller ignores this input in RC mode.
1	R/WSC	0x0	app_pm_xmt_pme Wake Up. If PME is enabled and PME support is configured for current PMCSR D-state asserting this signal (apps_pm_xmt_pme) causes the controller to wake from either L1 or L2 state. When the controller has transitioned back to the L0 state it transmits a PME message and set the PME_Status. Upon receiving the PME message the root complex should clear the PME_Status and change the D-state back to D0.
0	RW	0x0	app_clk_req_n Indicates that the application logic is ready to have reference clock removed. In designs which support reference clock removal through either L1 PM Sub-states or L1 CPM, the application should set this signal to 1'b1 if it supports reference clock removal. If the application does not want to remove reference clock it should set this signal to 1'b0. This signal should be asserted or de-asserted when L1 CPM or L1 Sub-states are being configured, it should not be changed dynamically during L1. Indicates that the application is ready to have reference clock removed. 1'b0: Application does not want to remove reference clock 1'b1: Application is ready to have reference clock removed

PCIE_CLIENT_POWER_STATUS

Address: **Operational Base** + offset (0x0030)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved

Bit	Attr	Reset Value	Description
14	R/W SC	0x0	obff_cpu_active_msg_req Request controller to generate a "CPU Active" OBFF message. This bit clears automatically when request has been sent. Only usable in a downstream port. When application sets OBFF Enable bit in Device Control 2 Register to choose to use OBFF message or WAKE# signaling.
13	R/W SC	0x0	obff_obff_msg_req Request controller to generate a "OBFF" OBFF message. This bit clears automatically when request has been sent. Only usable in a downstream port. When application sets OBFF Enable bit in Device Control 2 Register to choose to use OBFF message or WAKE# signaling.
12	R/W SC	0x0	obff_idle_msg_req Request controller to generate a "IDLE" OBFF message. This bit clears automatically when request has been sent. Only usable in a downstream port. When application sets OBFF Enable bit in Device Control 2 Register to choose to use OBFF message or WAKE# signaling.
11:9	RO	0x0	reserved
8	R/W SC	0x0	app_ltr_msg_req Indicates that your application is requesting to send an LTR message. Once asserted, app_ ltr_msg_req must remain asserted until the controller asserts app_ltr_msg_grant. Set to request controller to send a LTR Message. This bit clears automatically when request is granted by controller. Application should put LTR message information ready in LTR_MSG_TX_INFO register before setting this bit.
7:6	RO	0x0	reserved
5	R/W SC	0x0	app_unlock_msg Request from your application to generate an Unlock message. You must assert this signal for one clock cycle. The controller does not return an acknowledgment or grant signal. You must not pulse the same signal again, until the previous message has been transmitted.
4	R/W SC	0x0	apps_pm_xmt_turnoff Request from your application to generate a PM_Turn_Off message. You must assert this signal for one clock cycle. The controller does not return an acknowledgment or grant signal. You must not pulse the same signal again, until the previous message has been transmitted.
3:2	RO	0x0	reserved
1	RW	0x0	legacy_int_req When legacy_int_req (sys_int) goes from low to high, the controller generates an Assert_INTx Message. When sys_int goes from high to low, the controller generates a Deassert_INTx Message. There is a separate sys_int input bit for each function in your controller configuration. The Interrupt Pin register for the corresponding function determines which INTx Message the controller generates (INTA, INTB, INTC, or INTD). Legacy and native PCIe devices capable of generating an interrupt must support both Assert_INTx/Deassert_INTx and MSI or MSI-X. sys_int is intended to generate a message that emulates the legacy PCI Interrupts.

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RW	0x0	app_err_advisory Indicates that your application error is an advisory error. Your application should assert app_err_advisory under either of the following conditions: 1. The controller is configured to mask completion timeout errors, your application is reporting a completion timeout error app_err_bus, and your application intends to resend the request. In such cases the error is an advisory error, as described in PCI Express Specification. When your application does not intend to resend the request, then your application must keep app_err_advisory de-asserted when reporting a completion timeout error. 2. The controller is configured to forward poisoned TLPs to your application and your application is going to treat the poisoned TLP as a normal TLP, as described in PCI Express Specification. Upon receipt of a poisoned TLP, your application must report the error app_err_bus, and either assert app_err_advisory (to indicate an advisory error) or de-assert app_err_advisory (to indicate that your application is dropping the TLP). 1'b0: Application error is not an advisory error 1'b1: Application error is an advisory error

Bit	Attr	Reset Value	Description
2:0	RW	0x0	diag_ctrl_bus Diagnostic Control Bus 1. x01: Insert LCRC error by inverting the LSB of LCRC 2. x10: Insert ECRC error by inverting the LSB of ECRC 2.1 The rising edge of these two signals ([1:0]) enable the controller to assert an LCRC or ECRC to the packet that it currently being transferred. 2.2 When LCRC or ECRC error packets are transmitted by the controller, the controller asserts diag_status_bus[lcrc_err_asserted] or diag_status_bus[ecrc_err_asserted] to report that the requested action has been completed. This handshake between control and status allows your application to control a specific packet being injected with an CRC or ECRC error. 2.3 The LCRC and ECRC errors are generated by simply inverting the last bit of the LCRC or ECRC value. 3. 1xx: Select Fast Link Mode. 3.1 Sets all internal LTSSM millisecond timers to Fast Mode for speeding up simulation purposes. Forces the LTSSM training (link initialization) to use shorter timeouts and to link up faster. 3.2 The default scaling factor is 1024 for all internal timers. The default scaling factor can be changed using the DEFAULT_FAST_LINK_SCALING_FACTOR parameter or through the FAST_LINK_SCALING_FACTOR field in the TIMER_CTRL_MAX_FUNC_NUM_OFF register. 3.3 Fast Link Mode can also be activated by setting the FAST_LINK_MODE field in the PORT_LINK_CTRL_OFF register. 3.4 For more information, see the "Fast Link Simulation Mode" section in the "Integrating the Controller with the PHY or Application RTL or Verification IP" chapter of the User Guide.

14.4.3 Downstream Port Register

14.4.3.1 PCIE_DSP_PF0_TYPE1_HDR Register Description

14.4.3.1.1 Registers Summary

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_TYPE1_HDR_TYPE1_DEV_ID_VEND_ID_REG	0x0000	W	0x35761D87	This register holds the device ID and vendor ID.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_TYPE1_HDR_TYPE1_STATUS_COMMAND_REG	0x0004	W	0x00100000	This register provides the status and controls the behavior of a function.
PCIE_DSP_PF0_TYPE1_HDR_TYPE1_CLASS_CODE_REV_ID_REG	0x0008	W	0x00000001	This register specifies the class code and revision ID of a function.
PCIE_DSP_PF0_TYPE1_HDR_TYPE1_BIST_HDR_TYPE_LAT_CACHE_LINE_SIZE_REG	0x000C	W	0x00010000	This register provides the status and controls BIST. It also holds information regarding the header layout, latency timer, and cache line size.
PCIE_DSP_PF0_TYPE1_HDR_BAR0_REG	0x0010	W	0x00000000	System software must build a consistent address map before booting the machine to an operating system. This means it has to determine how much memory is in the system, and how much address space the Functions in the system require. After determining this information, system software can map the Functions into reasonable locations and proceed with system boot. In order to do this mapping in a device-independent manner, the base registers for this mapping are placed in the predefined header portion of Configuration Space. It is strongly recommended that power-up firmware/software also support the optional Enhanced Configuration Access Mechanism (ECAM).
PCIE_DSP_PF0_TYPE1_HDR_BAR1_REG	0x0014	W	0x00000000	System software must build a consistent address map before booting the machine to an operating system. This means it has to determine how much memory is in the system, and how much address space the Functions in the system require. After determining this information, system software can map the Functions into reasonable locations and proceed with system boot. In order to do this mapping in a device-independent manner, the base registers for this mapping are placed in the predefined header portion of Configuration Space. It is strongly recommended that power-up firmware/software also support the optional Enhanced

Name	Offset	Size	Reset Value	Description
				Configuration Access Mechanism (ECAM).
PCIE_DSP_PF0_TYPE1_HDR_SEC_LAT_TIMER_SUB_BUS_SEC_BUS_PRI_BUS_REG	0x0018	W	0x00000000	This register holds information regarding secondary latency timer, subordinate bus number, secondary bus number, and primary bus number.
PCIE_DSP_PF0_TYPE1_HDR_SEC_STAT_IO_LIMIT_IO_BASE_REG	0x001C	W	0x00000000	The I/O Limit and I/O Base registers are optional and define an address range that is used by the bridge to determine when to forward I/O transactions from one interface to the other. If a bridge does not implement an I/O address range, then both the I/O Limit and I/O Base registers must be implemented as read-only registers that return zero when read. If a bridge supports an I/O address range, then these registers must be initialized by configuration software so default states are not specified.
PCIE_DSP_PF0_TYPE1_HDR_MEM_LIMIT_MEM_BASE_REG	0x0020	W	0x00000000	The Memory Limit and Memory Base registers define a memory mapped address range which is used by the bridge to determine when to forward memory transactions from one interface to the other. If there is no prefetchable memory space, and there is no memory-mapped space on the secondary side of the bridge, then the bridge will not forward any memory transactions from the primary bus to the secondary bus and will forward all memory transactions from the secondary bus to the primary bus.
PCIE_DSP_PF0_TYPE1_HDR_PREF_MEM_LIMIT_PREF_MEM_BASE_REG	0x0024	W	0x00010001	The Prefetchable Memory Limit and Prefetchable Memory Base registers must indicate that 64-bit addresses are supported.The Prefetchable Memory Limit and Prefetchable Memory Base registers are optional. They define a prefetchable memory address range which is used by the bridge to determine when to forward memory transactions from one interface to the other (see the PCI-to-PCI Bridge Architecture Specification for additional details).

Copyright © 2024 Rockchip Electronics Co., Ltd.

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_TYPE1_HDR_PREF_BASE_UPPER_REG	0x0028	W	0x00000000	The Prefetchable Base Upper 32 Bits register is an optional extension to the Prefetchable Memory Base register.
PCIE_DSP_PF0_TYPE1_HDR_PREF_LIMIT_UPPER_REG	0x002C	W	0x00000000	The Prefetchable Limit Upper 32 Bits register is an optional extension to the Prefetchable Memory Limit register.
PCIE_DSP_PF0_TYPE1_HDR_IO_LIMIT_UPPER_IO_BASE_UPPER_REG	0x0030	W	0x00000000	The I/O Limit Upper 16 Bits and I/O Base Upper 16 Bits registers are optional extensions to the I/O Limit and I/O Base registers.
PCIE_DSP_PF0_TYPE1_HDR_TYPE1_CAP_PTR_REG	0x0034	W	0x00000040	This register is used to point to a linked list of capabilities implemented by a Function.
PCIE_DSP_PF0_TYPE1_HDR_TYPE1_EXP_ROM_BASE_REG	0x0038	W	0x00000000	This register is defined to handle the base address and size information for this expansion ROM. The mask for this ROM BAR exists (if implemented) as a shadow register at this address. The assertion of CS2 (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) is required to write to the second register at this address.
PCIE_DSP_PF0_TYPE1_HDR_BRIDGE_CTRL_INT_PIN_INT_LINE_REG	0x003C	W	0x000001FF	This register provides many of the same controls for the secondary interface that are provided by the Command Register for theprimary interface. This register also identifies the legacy interrupt Message(s) a Function uses and communicates interrupt line routing information.

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

14.4.3.1.2 Detail Registers Description

PCIE_DSP_PF0_TYPE1_HDR_TYPE1_DEV_ID_VEND_ID_REG

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:16	RO	0x3576	DEVICE_ID Device ID. The Device ID register identifies the particular Function. This identifier is allocated by the vendor. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
15:0	RO	0x1d87	VENDOR_ID Vendor ID. The Vendor ID register identifies the manufacturer of the Function. Valid vendor identifiers are allocated by the PCI-SIG to ensure uniqueness. It is not permitted to populate this register with a value of FFFFh, which is an invalid value for Vendor ID. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.

PCIE_DSP_PF0_TYPE1_HDR_TYPE1_STATUS_COMMAND_REG

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31	RW	0x0	DETECTED_PARITY_ERROR Detected Parity Error. The bit is set when the Poisoned TLP is received by a Function's primary side.
30	RW	0x0	SIGNALED_SYS_ERROR Signaled System Error.
29	RW	0x0	RCVD_MASTER_ABORT Received Master Abort. This bit is set when a Requester receives a Completion with Unsupported Request Completion status. The bit is set when the Unsupported Request is received by a Function's primary side.
28	RW	0x0	RCVD_TARGET_ABORT Received Target Abort. This bit is set when a Requester receives a Completion with Completer Abort Completion status. The bit is set when the Completer Abort is received by a Function's primary side.
27	RW	0x0	SIGNALED_TARGET_ABORT Signaled Target Abort. This bit is set when a Function completes a Posted or Non-Posted Request as a Completer Abort error. This applies to a Function when the Completer Abort was generated by its primary side.
26:25	RO	0x0	DEV_SEL_TIMING DEVSEL Timing. This field was originally described in the PCI Local Bus Specification. Its functionality does not apply to PCI Express. The controller hardwires it to 00b.
24	RW	0x0	MASTER_DPE Master Data Parity Error. This bit is set by a Function if the Parity Error Response bit in the Command register is 1b and either of the following two conditions occurs: - Port receives a Poisoned Completion going downstream - Port transmits a Poisoned Request upstream If the Parity Error Response bit is 0b, this bit is never set.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
23	RO	0x0	FAST_B2B_CAP Fast Back-to-Back Transactions Capable. This bit was originally described in the PCI Local Bus Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b.
22	RO	0x0	RSVDP_22 Reserved for future use.
21	RO	0x0	FAST_66MHZ_CAP 66 MHz Capable. This bit was originally described in the PCI Local Bus Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b.
20	RO	0x1	CAP_LIST Capabilities List. Indicates the presence of an Extended Capability list item. Since all PCI Express device Functions are required to implement the PCI Express Capability structure, the controller hardwires this bit to 1b.
19	RO	0x0	INT_STATUS Interrupt Status. INTx emulation interrupts forwarded by Functions from the secondary side are not reflected in this bit. Setting the Interrupt Disable bit has no effect on the state of this bit. For Functions that do not generate INTx interrupts, the controller hardwires this bit to 0b.
18:17	RO	0x0	RSVDP_17 Reserved for future use.
16	RO	0x0	reserved
15:11	RO	0x00	RESERV Reserved.
10	RW	0x0	INT_EN Interrupt Disable. Controls the ability of a Function to generate INTx emulation interrupts. Note: - Any INTx emulation interrupts already asserted by the Function must be deasserted when this bit is set. INTx interrupts use virtual wires that must, if asserted, be deasserted using the appropriate Deassert_INTx message(s) when this bit is set. - Only the INTx virtual wire interrupt(s) associated with the Function(s) for which this bit is set are affected. - For Functions that generate INTx interrupts on their own behalf, this bit is required. This bit has no effect on interrupts forwarded from the secondary side. For Functions that do not generate INTx interrupts on their own behalf this bit is optional. If this bit is not implemented, the controller hardwires it to 0b.
9	RO	0x0	RSVDP_9 Reserved for future use.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
8	RW	0x0	SERREN SERR# Enable. Note: - The errors are reported if enabled either through this bit or through the PCI Express specific bits in the Device Control register. - In addition, this bit controls transmission by the primary interface of ERR_NONFATAL and ERR_FATAL error Messages forwarded from the secondary interface. This bit does not affect the transmission of forwarded ERR_COR messages.
7	RO	0x0	IDSEL IDSEL Stepping/Wait Cycle Control. This bit was originally described in the PCI Local Bus Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b.
6	RW	0x0	PERREN Parity Error Response. This bit controls the logging of poisoned TLPs in the Master Data Parity Error bit in the Status register.
5	RO	0x0	VGAPS VGA Palette Snoop. This bit was originally described in the PCI Local Bus Specification and the PCI-to-PCI Bridge Architecture Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b.
4	RO	0x0	MWI_EN Memory Write and Invalidate. This bit was originally described in the PCI Local Bus Specification and the PCI-to-PCI Bridge Architecture Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b. For PCI Express to PCI/PCI-X Bridges, refer to the PCI Express to PCI/PCI-X Bridge Specification for requirements for this register.
3	RO	0x0	SCO Special Cycle Enable. This bit was originally described in the PCI Local Bus Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b.
2	RW	0x0	BME Bus Master Enable. This bit controls forwarding of Memory or I/O requests by a port in the Upstream direction. When this bit is 0b, Memory and I/O Requests received at a Root Port must be handled as Unsupported Requests (UR) For Non-Posted Requests a Completion with UR completion status must be returned. This bit does not affect forwarding of Completions in either the Upstream or Downstream direction. The forwarding of Requests other than Memory or I/O Requests is not controlled by this bit.

Bit	Attr	Reset Value	Description
1	RW	0x0	MSE Memory Space Enable. This bit controls a Function's response to Memory Space accesses received on its primary side. You cannot write to this register if your configuration has no MEM BARs; that is, the internal signal has_mem_bar =0. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: !has_mem_bar ? RO : RW
0	RW	0x0	IO_EN IO Space Enable. This bit controls a Function's response to I/O Space accesses received on its primary side. You cannot write to this register if your configuration has no IO BARs; that is, the internal signal has_io_bar =0. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: !has_io_bar ? RO : RW

PCIE_DSP_PF0_TYPE1_HDR_TYPE1_CLASS_CODE_REV_ID_REG

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	BASE_CLASS_CODE Base Class Code. A code that broadly classifies the type of operation the Function performs. Encodings for base class, are provided in the PCI Code and ID Assignment Specification. All unspecified encodings are reserved. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.
23:16	RO	0x00	SUBCLASS_CODE Sub-Class Code. Specifies a base class sub-class, which identifies more specifically the operation of the Function. Encodings for sub-class are provided in the PCI Code and ID Assignment Specification. All unspecified encodings are reserved. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.

Bit	Attr	Reset Value	Description
15:8	RO	0x00	PROGRAM_INTERFACE Programming Interface. This field identifies a specific register level programming interface (if any) so that device independent software can interact with the Function. Encodings for interface are provided in the PCI Code and ID Assignment Specification. All unspecified encodings are reserved. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.
7:0	RO	0x01	REVISION_ID Revision ID. The value of this field specifies a Function specific revision identifier. The value is chosen by the vendor. Zero is an acceptable value. The Revision ID should be viewed as a vendor defined extension to the Device ID. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.

PCIE_DSP_PF0_TYPE1_HDR_TYPE1_BIST_HDR_TYPE_LAT_CACHE_LINE_SIZE_REG

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	BIST BIST. This register is used for control and status of BIST. Functions that do not support BIST must hardwire the register to 00h. A Function whose BIST is invoked must not prevent normal operation of the PCI Express Link. Bit descriptions: - [31]: BIST Capable. When set, this bit indicates that the Function supports BIST. When Clear, the Function does not support BIST. - [30]: Start BIST. If BIST Capable is set, set this bit to invoke BIST. The Function resets the bit when BIST is complete. Software is permitted to fail the device if this bit is not Clear (BIST is not complete) 2 seconds after it had been set. Writing this bit to 0b has no effect. The controller hardwires this bit to 0b if BIST Capable is clear. - [29:28]: Reserved. - [27:24]: Completion Code. This field encodes the status of the most recent test. A value of 0000b means that the Function has passed its test. Non-zero values mean the Function failed. Function-specific failure codes can be encoded in the non-zero values. This field's value is only meaningful when BIST Capable is set and Start BIST is Clear. This field must be hardwired to 0000b if BIST Capable is clear.

Bit	Attr	Reset Value	Description
23	RO	0x0	MULTI_FUNC Multi-Function Device. Except where stated otherwise, it is recommended that this bit be set if there are multiple Functions, and clear if there is only one Function. Note: This register field is sticky.
22:16	RO	0x01	HEADER_TYPE Header Layout. This field identifies the layout of the second part of the predefined header. The controller uses 000 0001b encoding. The encoding 000 0010b is reserved. This encoding was originally described in the PC Card Standard Electrical Specification and is used in previous versions of the programming model. Careful consideration should be given to any attempt to re-purpose it.
15:8	RO	0x00	LATENCY_MASTER_TIMER Latency Timer. This register is also referred to as Primary Latency Timer. The Latency Timer was originally described in the PCI Local Bus Specification and the PCI-to-PCI Bridge Architecture Specification. Its functionality does not apply to PCI Express. The controller hardwires this register to 00h.
7:0	RW	0x00	CACHE_LINE_SIZE Cache Line Size. The Cache Line Size register is programmed by the system firmware or the operating system to system cache line size. However, legacy conventional PCI software may not always be able to program this register correctly especially in the case of Hot-Plug devices. This read-write register is implemented for legacy compatibility purposes but has no effect on any PCI Express device behavior.

PCIE_DSP_PF0_TYPE1_HDR_SEC_LAT_TIMER_SUB_BUS_SEC_BUS_PRI_BUS_REG

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	SEC_LAT_TIMER Secondary Latency Timer. This register does not apply to PCI Express. The controller hardwires it to 00h.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
23:16	RW	0x00	SUB_BUS Subordinate Bus Number. The Subordinate Bus Number register is used to record the bus number of the highest numbered PCI bus segment which is behind (or subordinate to) the bridge. Configuration software programs the value in this register. The bridge uses this register in conjunction with the Secondary Bus Number register to determine when to respond to and pass on a Type 1 configuration transaction on the primary interface to the secondary interface.
15:8	RW	0x00	SEC_BUS Secondary Bus Number. The Secondary Bus Number register is used to record the bus number of the PCI bus segment to which the secondary interface of the bridge is connected. Configuration software programs the value in this register. The bridge uses this register to determine when to respond to and convert a Type 1 configuration transaction on the primary interface into a Type 0 transaction on the secondary interface.
7:0	RW	0x00	PRIM_BUS Primary Bus Number. This register is not used by PCI Express Functions. It is implemented for compatibility with legacy software.

PCIE_DSP_PF0_TYPE1_HDR_SEC_STAT_IO_LIMIT_IO_BASE_REG

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31	RW	0x0	SEC_STAT_DPE Detected Parity Error. This bit is set by a Function when a Poisoned TLP is received by its secondary side, regardless of the state the Parity Error Response Enable bit in the Bridge Control register.
30	RW	0x0	SEC_STAT_RCVD_SYS_ERR Received System Error. This bit is set when the secondary side of a Function receives an ERR_FATAL or ERR_NONFATAL message.
29	RW	0x0	SEC_STAT_RCVD_MSTR_ABRT Received Master Abort. This bit is set when the secondary side of a Function (for requests initiated by the Type 1 header Function itself) receives a Completion with Unsupported Request Completion status.
28	RW	0x0	SEC_STAT_RCVD_TRGT_ABRT Received Target Abort. This bit is set when the secondary side of a Function (for requests initiated by the Type 1 header Function itself) receives a Completion with Completer Abort Completion status.
27	RW	0x0	SEC_STAT_SIG_TRGT_ABRT Signaled Target Abort. This bit is set when the secondary side of the Function (for Requests completed by the Type 1 header Function itself) completes a Posted or Non-Posted request as a Completer Abort error.
26:25	RO	0x0	RSVDP_25 Reserved for future use.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
24	RW	0x0	SEC_STAT_MDPE Master Data Parity Error. This bit is set by a Function if the Parity Error Response Enable bit in the Bridge Control register is set, and either of the following two conditions occurs: - Port receives a Poisoned Completion coming Upstream - Port transmits a Poisoned Request Downstream If the Parity Error Response Enable bit is clear, this bit is never set.
23	RO	0x0	RSVDP_23 Reserved for future use.
22:16	RO	0x00	SEC_STAT_RESERV Reserved.
15:12	RW	0x0	IO_LIMIT I/O Limit Address. These bits correspond to the address[15:12] of IO address range. For the purpose of address decoding, the bridge assumes that the lower 12 address bits, address[11:0], of the I/O limit address (not implemented in the I/O Limit register) are FFFh. The I/O Limit register can be programmed to a smaller value than the I/O Base register, if there are no I/O addresses on the secondary side of the bridge. In this case, the bridge will not forward any I/O transactions from the primary bus to the secondary and will forward all I/O transactions from the secondary bus to the primary bus.
11:9	RO	0x0	IO_RESERV1 Reserved.
8	RO	0x0	IO_DECODE_BIT8 I/O Addressing Encode (IO Limit Address). This bit encodes the IO addressing capability of the bridge. Note: - For 16bit I/O address decoding, the bridge must still perform a full 32-bit decode of the I/O address (that is, check that Address[31:16] are 0000h). In this case, the I/O address range supported by the bridge will be restricted to the first 64 KB of I/O Space (0000 0000h to 0000 FFFFh). - For 16bit I/O address decoding, the bridge assumes that the upper 16 address bits, Address[31:16], of the I/O limit address (not implemented in I/O Limit register) are zero. - For 32bit I/O address decoding, and the I/O Limit Upper 16 Bits hold the upper 16 bits, corresponding to Address[31:16], of the 32-bit Limit address. In this case, system configuration software is permitted to locate the I/O address range supported by the bridge anywhere in the 4-GB I/O Space. - The 4-KB alignment and granularity restrictions still apply when the bridge supports 32-bit I/O addressing. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R

When this field is non-zero, it indicates the status of hardware validation of the Expansion ROM contents. - If the Function does not support validation, this field must be hardwired to 000b. - It is optional whether an implementation is capable of returning Validation Status values 011b, 101b, 110b, or 111b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (EXP_ROM_BAR_MASK_REG.ROM_BAR_ENABLED == 1 && DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
0	RW	0x0	ROM_BAR_ENABLE Expansion ROM Enable. This bit controls whether or not the Function accepts accesses to its expansion ROM. The Memory Space Enable bit in the Command register has precedence over the Expansion ROM Enable bit. A Function must claim accesses to its expansion ROM only if both the Memory Space Enable bit and the Expansion ROM Enable bit are set. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (EXP_ROM_BAR_MASK_REG.ROM_BAR_ENABLED == 1) then R/W else R

PCIE_DSP_PF0_TYPE1_HDR_BRIDGE_CTRL_INT_PIN_INT_LINE_REG

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:23	RO	0x000	BRIDGE_CTRL_RESERV Reserved.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
22	RW	0x0	SBR Secondary Bus Reset. Setting this bit triggers a hot reset on the corresponding PCI Express Port. Software must ensure a minimum reset duration (Trst) as defined in the PCI Local Bus Specification. Software and systems must honor first-access-following-reset timing requirements, unless the Readiness Notifications mechanism is used or if the Immediate Readiness bit in the relevant Function's Status Register register is set. Port configuration registers must not be changed, except as required to update Port status.
21	RO	0x0	MSTR_ABORT_MODE Master Abort Mode. This bit was originally described in the PCI-to-PCI Bridge Architecture Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W
20	RO	0x0	VGA_16B_DEC VGA 16 bit decode. This bit only has meaning if VGA Enable bit is set. This bit enables system configuration software to select between 10-bit and 16-bit I/O address decoding for all VGA I/O register accesses that are forwarded from primary to secondary. For Functions that do not support VGA, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R
19	RO	0x0	VGA_EN VGA Enable. Modifies the response by the bridge to VGA compatible addresses. If the VGA Enable bit is set, the bridge will positively decode and forward the following accesses on the primary interface to the secondary interface (and, conversely, block the forwarding of these addresses from the secondary to primary interface): - Memory accesses in the range 000A 0000h to 000B FFFFh - I/O addresses in the first 64 KB of the I/O address space (Address[31:16] are 0000h) where Address[9:0] are in the ranges 3B0h to 3BBh and 3C0h to 3DFh (inclusive of ISA address aliases determined by the setting of VGA 16-bit Decode) If the VGA Enable bit is set, forwarding of these accesses is independent of the I/O address range and memory address ranges defined by the I/O Base and Limit registers, the Memory Base and Limit registers, and the Prefetchable Memory Base and Limit registers of the bridge. (Forwarding of these accesses is also independent of the setting of the ISA Enable bit (in the Bridge Control register) when the VGA Enable bit is set. Forwarding of these accesses is qualified by the I/O Space Enable and Memory Space Enable bits in the Command register.)

Bit	Attr	Reset Value	Description
			For Functions that do not support VGA, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R
18	RW	0x0	ISA_EN ISA Enable. Modifies the response by the bridge to ISA I/O addresses. This applies only to I/O addresses that are enabled by the I/O Base and I/O Limit registers and are in the first 64 KB of I/O address space (0000 0000h to 0000 FFFFh). If this bit is set, the bridge will block any forwarding from primary to secondary of I/O transactions addressing the last 768 bytes in each 1-KB block. In the opposite direction (secondary to primary), I/O transactions will be forwarded if they address the last 768 bytes in each 1-KB block.
17	RW	0x0	SERR_EN SERR# Enable. This bit controls forwarding of ERR_COR, ERR_NONFATAL and ERR_FATAL from secondary to primary.
16	RW	0x0	PERE Parity Error Response Enable. This bit controls the logging of poisoned TLPs in the Master Data Parity Error bit in the Secondary Status register.
15:8	RO	0x01	INT_PIN Reserved. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
7:0	RW	0xff	INT_LINE Reserved

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_PM_CAP_CAP_ID_NXT_PTR_REG	0x0000	W	0xDFC35001	This register provides information refarding the Power Management Capabilities.
PCIE_DSP_PF0_PM_CAP_CON_STATUS_REG	0x0004	W	0x00000008	This register is used to manage the PCI function's power management state as well as to enable/monitor PMEs.

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

14.4.3.2.2 Detail Registers Description

PCIE_DSP_PF0_PM_CAP_CAP_ID_NXT_PTR_REG

Address: Operational Base(0x00000040) + offset (0x0000)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:27	RO	0x1b	PME_SUPPORT PME_Support. This 5-bit field indicates the power states in which the function may generate a PME and/or forward PME messages. A value of 0b for any bit indicates that the function is not capable of asserting PME while in that power state. - bit(27) X XXX1b - PME can be generated from D0 - bit(28) X XX1Xb - PME can be generated from D1 - bit(29) X X1XXb - PME can be generated from D2 - bit(30) X 1XXXb - PME can be generated from D3hot - bit(31) 1 XXXXb - PME can be generated from D3cold Bit 31 (PME can be asserted from D3cold) represents a special case. Functions that set this bit require some sort of auxiliary power source. Implementation specific mechanisms are recommended to validate that the power source is available before setting this bit. Each bit that corresponds to a supported D-state must be set for PCI-PCI Bridge structures representing Ports on Root Complexes/Switches to indicate that the Bridge will forward PME Messages. Bit 31 must only be set if the Port is still able to forward PME Messages when main power is not available. The read value from this field is the write value && (sys_aux_pwr_det, 1'b1, D2_SUPPORT, D1_SUPPORT, 1'b1), where D1_SUPPORT and D2_SUPPORT are fields in this register. The reset value PME_SUPPORT_n && (sys_aux_pwr_det, 1'b1, D2_SUPPORT, D1_SUPPORT, 1'b1), where PME_SUPPORT_n is a configuration parameter. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
26	RO	0x1	D2_SUPPORT D2_Support. If this bit is set, this function supports the D2 Power Management state. Functions that do not support D2 must always return a value of 0b for this bit. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
25	RO	0x1	D1_SUPPORT D1_Support. If this bit is set, this function supports the D1 Power Management state. Functions that do not support D1 must always return a value of 0b for this bit. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.

Bit	Attr	Reset Value	Description
24:22	RO	0x7	AUX_CURR Aux_Current. This 3 bit field reports the Vaux auxiliary current requirements for the function. If this function implements the Data Register, the controller hardwires this field to 000b. If PME_Support is 0 xxxxb (PME assertion from D3cold is not supported), the controller hardwires this field to 0000b. For functions where PME_Support is 1 xxxxb (PME assertion from D3cold is supported), and which do not implement the Data field, the encodings defined in Values: apply: Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
21	RO	0x0	DSI Device Specific Initialization. The DSI bit indicates whether special initialization of this function is required. When set, indicates that the function requires a device specific initialization sequence following a transition to the D0uninitialized state. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
20	RO	0x0	reserved
19	RO	0x0	PME_CLK PME Clock. Does not apply to PCI Express, the controller hardwires it to 0b. Note: This register field is sticky.
18:16	RO	0x3	PM_SPEC_VER Version. This field provides the Power Management specification version. The controller hardwires this field to 011b for functions compliant to PCI Express Base Specification, Revision 4.0, Version 1.0>. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
15:8	RO	0x50	PM_NEXT_POINTER Next Capability Pointer. This field provides an offset into the function's configuration space pointing to the location of next item in the capabilities list. If there are no additional items in the capabilities list, this field is set to 00h. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
7:0	RO	0x01	PM_CAP_ID Capability ID. This field returns 01h to indicate that this is the PCI Power Management Capability. Each function may have only one item in its capability list with Capability ID set to 01h.

PCIE_DSP_PF0_PM_CAP_CON_STATUS_REG

Address: Operational Base(0x00000040) + offset (0x0004)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	DATA_REG_ADD_INFO Data. This field is used to report the state dependent data requested by the Data_Select field. The value of this field is scaled by the value reported by the Data_Scale field.
23	RO	0x0	BUS_PWR_CLK_CON_EN Bus Power/Clock Control Enable. If this field is set, Bus Power/Clock Control is Enable.
22	RO	0x0	B2_B3_SUPPORT B2B3 Support for D3hot. If this field is set, B2B3 support for D3hot is available.
21:16	RO	0x00	RSVDP_16 Reserved for future use.
15	RW	0x0	PME_STATUS PME_Status. This bit is set when the function normally generates a PME signal. The value of this bit is not affected by the value of the PME_En bit. If PME_Support bit 31 of the Power Management Capabilities register is clear, this bit is permitted to be hardwired to 0b. Functions that consume Aux power must preserve the value of this sticky register when Aux power is available. In such functions, this register value is not modified by Conventional Reset or FLR. Note: This register field is sticky.
14:13	RO	0x0	DATA_SCALE Data_Scale. This field indicates the scaling factor to be used when interpreting the value of the Data field. The value and meaning of this field varies depending on which data value has been selected by the Data_Select field. For more details, see 7.5.2.3 section of PCI Express Base Specification.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
12:9	RO	0x0	DATA_SELECT Data_Select. This 4-bit field is used to select which data is to be reported through the Data and Data_Scale field. If the Data field is not implemented, this field must be hardwired to 0000b.
8	RW	0x0	PME_ENABLE PME_En. - When set, the function is permitted to generate a PME. - When clear, the function is not permitted to generate a PME. If PME_Support is 1 xxxxb (PME generation from D3cold) or the function consumes Aux power and Aux power is available this bit is RWS and the bit is not modified by Conventional Reset or FLR. If PME_Support is 0 xxxxb, this field is not sticky (RW). If PME_Support is 0 0000b, the controller hardwires this bit to 0b. Note: This register field is sticky.
7:4	RO	0x0	RSVDP_4 Reserved for future use.
3	RO	0x1	NO_SOFT_RST No_Soft_Reset. This bit indicates the state of the function after writing the PowerState field to transition the function from D3hot to D0. - When set, this transition preserves internal function state. The function is in D0Active and no additional software intervention is required. - When clear, this transition results in undefined internal function state. Regardless of this bit, functions that transition from D3hot to D0 by Fundamental Reset will return to D0Uninitialized with only PME context preserved if PME is supported and enabled. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
2	RO	0x0	RSVDP_2 Reserved for future use.
1:0	RW	0x0	POWER_STATE PowerState. This 2-bit field is used both to determine the current power state of a function and to set the function into a new power state. You can write to this register; however, the read-back value is the actual power state, not the write value. If you attempt to write an unsupported, optional state to this field, the write operation completes normally; however, the data is discarded and no state change occurs. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W

14.4.3.3 PCIE_DSP_PF0_MSI_CAP Register Description

14.4.3.3.1 Registers Summary

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_MSI_CAP_PCI_MSI_CAP_ID_NEXT_CTRL_REG	0x0000	W	0x008A7005	This register holds MSI Capability Header information and controls the MSI behaviour.
PCIE_DSP_PF0_MSI_CAP_MSI_CAP_OFF_04H_REG	0x0004	W	0x00000000	This register holds the system specified message address for an MSI transaction.
PCIE_DSP_PF0_MSI_CAP_MSI_CAP_OFF_08H_REG	0x0008	W	0x00000000	For a function that supports a 32-bit message address, - bits[31:16] of this register represent the Extended Message Data, and - bits[15:0] of this register represent the Message DataFor a function that supports a 64-bit message address (bit 23 in PCI_MSI_CAP_ID_NEXT_CTRL_REG register set), this register represents the Message Upper Address Register for MSI (Offset 08h). It specifies the Message Upper Address (System-specified message upper address). This register is required for PCI Express Endpoints and is optional for other function types. If the Message Enable bit (bit 0 of the Message Control register) is set, the contents of this register (if non-zero) specify the upper 32-bits of a 64-bit message address (Address[63:32]). If the contents of this register are zero, the Function uses the 32 bit address specified by the Message Address register.
PCIE_DSP_PF0_MSI_CAP_MSI_CAP_OFF_0CH_REG	0x000C	W	0x00000000	For a function that supports a 32-bit message address, this register contains the Mask Bits when the Per-Vector Masking Capable bit (bit 24 of PCI_MSI_CAP_ID_NEXT_CTRL_REG) is set.For a function that supports a 64-bit message address, this register contains Message Data.

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

14.4.3.3.2 Detail Registers Description

PCIE_DSP_PF0_MSI_CAP_PCI_MSI_CAP_ID_NEXT_CTRL_REG

Address: Operational Base(0x00000050) + offset (0x0000)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	RSVDP_27 Reserved for future use.

Bit	Attr	Reset Value	Description
26	RW	0x0	PCI_MSI_EXT_DATA_EN Extended Message Data Enable. - If set, the function is enabled to provide Extended Message Data. - If clear, the function is not enabled to provide Extended Message Data. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: PCI_MSI_CAP_ID_NEXT_CTRL_REG.PCI_MSI_EXT_DATA_CAP ? RW : RO
25	RO	0x0	PCI_MSI_EXT_DATA_CAP Extended Message Data Capable. - If set, the function is capable of providing Extended Message Data. - If clear, the function does not support providing Extended Message Data. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
24	RO	0x0	PCI_PVM_SUPPORT Per-Vector Masking Capable. - If set, the function supports MSI Per-Vector Masking. - If clear, the function does not support MSI Per-Vector Masking.
23	RO	0x1	PCI_MSI_64_BIT_ADDR_CAP 64 bit address capable. - If set, the function is capable of sending a 64-bit message address. - If clear, the function is not capable of sending a 64-bit message address. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
22:20	RW	0x0	PCI_MSI_MULTIPLE_MSG_EN Multiple Message Enable. Software writes to this field to indicate the number of allocated vectors (equal to or less than the number of requested vectors). The number of allocated vectors is aligned to a power of two. If a function requests four vectors (indicated by a Multiple Message Capable encoding of 010b), system software can allocate either four, two, or one vector by writing a 010b, 001b, or 000b to this field, respectively. When MSI is enabled, a function will be allocated at least 1 vector. All encodings other than the defined encodings are reserved. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
19:17	RO	0x5	PCI_MSI_MULTIPLE_MSG_CAP Multiple Message Capable. System software reads this field to determine the number of requested vectors. The number of requested vectors must be aligned to a power of two (if a function requires three vectors, it requests four by initializing this field to 010b). All encodings other than the defined encodings are reserved. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
16	RW	0x0	PCI_MSI_ENABLE MSI Enable. - If set and the MSI-X Enable bit in the MSI-X Message Control register is clear, the function is permitted to use MSI to request service and is prohibited from using INTx interrupts. System configuration software sets this bit to enable MSI. A device driver is prohibited from writing this bit to mask a function's service request. For more details on control of INTx interrupts, see section 7.5.1.1 of PCI Express Base Specification. - If clear, the function is prohibited from using MSI to request service. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W
15:8	RO	0x70	PCI_MSI_CAP_NEXT_OFFSET Next Capability Pointer. This field contains the offset to the next PCI Capability structure or 00h if no other items exist in the linked list of Capabilities. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
7:0	RO	0x05	PCI_MSI_CAP_ID Capability ID. Indicates the MSI Capability structure. This field returns a Capability ID of 05h indicating that this is an MSI Capability structure.

PCIE_DSP_PF0_MSI_CAP_MSI_CAP_OFF_04H_REG

Address: Operational Base(0x00000050) + offset (0x0004)

Bit	Attr	Reset Value	Description
31:2	RW	0x00000000	PCI_MSI_CAP_OFF_04H Message Address - System-specified message address. If the Message Enable bit (bit 16 of the PCI_MSI_CAP_ID_NEXT_CTRL_REG register) is set, the contents of this field specify the DWORD-aligned address (Address[31:02]) for the MSI transaction. Address[1:0] are set to 00b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W

PCIE_DSP_PF0_MSI_CAP_MSI_CAP_OFF_08H_REG

Address: Operational Base(0x00000050) + offset (0x0008)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	PCI_MSI_CAP_OFF_0AH For a function that supports a 32-bit message address, this field contains Extended Message Data (System-specified message data). For the MSI Capability structures without per-vector masking, it must be implemented if the Extended Message Data Capable bit is set; otherwise, it is outside the MSI Capability structure and undefined. For the MSI Capability structures with Per-vector Masking, it must be implemented if the Extended Message Data Capable bit is set; otherwise, it is RsvdP. If the Extended Message Data Enable bit (bit 26 of the PCI_MSI_CAP_ID_NEXT_CTRL_REG) is set, the DWORD Memory Write transaction uses Extended Message Data for the upper 16 bits; otherwise, it uses 0000h for the upper 16 bits. For a function that supports a 64-bit message address, it contains upper 16 bits of the Message Upper Address. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: PCI_MSI_64_BIT_ADDR_CAP || `DEFAULT_EXT_MSI_DATA_CAPABLE ? R/W : R
15:0	RW	0x0000	PCI_MSI_CAP_OFF_08H For a function that supports a 32-bit message address, this field contains Message Data (System-specified message data). If the Message Enable bit (bit 16 of the PCI_MSI_CAP_ID_NEXT_CTRL_REG) is set, the function sends a DWORD Memory Write transaction using Message Data for the lower 16 bits. All 4 Byte Enables are set. The Multiple Message Enable field (bits 22:20 of the PCI_MSI_CAP_ID_NEXT_CTRL_REG) defines the number of low order message data bits the function is permitted to modify to generate its system software allocated vectors. For example, a Multiple Message Enable encoding of 010b indicates the function has been allocated four vectors and is permitted to modify message data bits 1 and 0 (a function modifies the lower message data bits to generate the allocated number of vectors). If the Multiple Message Enable field is 000b, the Function is not permitted to modify the message data. For a function that supports a 64-bit message address, it contains lower 16 bits of the Message Upper Address. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W

PCIE_DSP_PF0_PCIE_CAP_ROOT_STATUS_REG	0x0020	W	0x00000000	The Root Status register provides information about PCI Express device specific parameters.
PCIE_DSP_PF0_PCIE_CAP_DEVICE_CAPABILITIES2_REG	0x0024	W	0x000C0C10	This register identifies PCI Express device specific capabilities; in addition to the Device Capabilities Register.
PCIE_DSP_PF0_PCIE_CAP_DEVICE_CONTROL2_DEVICE_STATUS2_REG	0x0028	W	0x00000000	This register controls PCI Express device specific parameters and provides information about PCI Express device (function) specific parameters; in addition to the Device Control and Device Status Register.
PCIE_DSP_PF0_PCIE_CAP_LINK_CAPABILITIES2_REG	0x002C	W	0x0000000E	This register identifies PCI Express Link specific capabilities; in addition to the Link Capabilities Register.
PCIE_DSP_PF0_PCIE_CAP_LINK_CONTROL2_LINK_STATUS2_REG	0x0030	W	0x00010003	This register controls and provides information about PCI Express Link specific parameters; in addition to the Link Control and Link Status Register.

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

14.4.3.4.2 Detail Registers Description

PCIE_DSP_PF0_PCIE_CAP_PCIE_CAP_ID_PCIE_NEXT_CAP_PTR_PCIE_CAP_REG

Address: Operational Base(0x00000070) + offset (0x0000)

Bit	Attr	Reset Value	Description
31	RO	0x0	RSVDP_31 Reserved for future use.
30	RO	0x0	RSVD Reserved.
29:25	RO	0x00	PCIE_INT_MSG_NUM

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
			PCIE Interrupt Message Number. Interrupt Message Number. This field indicates which MSI/MSI-X vector is used for the interrupt message generated in association with any of the status bits of this Capability structure. For MSI, the value in this field indicates the offset between the base Message Data and the interrupt message that is generated. Hardware is required to update this field so that it is correct if the number of MSI Messages assigned to the Function changes when software writes to the Multiple Message Enable field in the MSI Message Control register. For MSI-X, the value in this field indicates which MSI-X Table entry is used to generate the interrupt message. The entry must be one of the first 32 entries even if the Function implements more than 32 entries. For a given MSI-X implementation, the entry must remain constant. If both MSI and MSI-X are implemented, they are permitted to use different vectors, though software is permitted to enable only one mechanism at a time. If MSI-X is enabled, the value in this field must indicate the vector for MSI-X. If MSI is enabled or neither is enabled, the value in this field must indicate the vector for MSI. If software enables both MSI and MSI-X at the same time, the value in this field is undefined. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
24	RO	0x0	PCIE_SLOT_IMP Slot Implemented. When set, this bit indicates that the Link associated with this Port is connected to a slot (as compared to being connected to a system-integrated device or being disabled). This bit is valid for Downstream Ports. This bit is undefined for Upstream Ports. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R

Bit	Attr	Reset Value	Description
23:20	RO	0x4	PCIE_DEV_PORT_TYPE Device/Port Type. Indicates the specific type of this PCI Express function. Note: Different functions in a Multi-Function Device can generally be of different types. Defined encodings for functions that implement a Type 00h PCI Configuration Space header are: Defined encodings for functions that implement a Type 01h PCI Configuration Space header are: All other encodings are Reserved. Note: Different Endpoint types have notably different requirements in Section 1.3.2 of PCI Express Base Specification regarding I/O resources, Extended Configuration Space, and other capabilities.
19:16	RO	0x2	PCIE_CAP_REG Capability Version. Indicates PCI-SIG defined PCI Express Capability structure version number. A version of the specification that changes the PCI Express Capability structure in a way that is not otherwise identifiable (for example, through a new Capability field) is permitted to increment this field. All such changes to the PCI Express Capability structure must be software-compatible. Software must check for Capability Version numbers that are greater than or equal to the highest number defined when the software is written, as functions reporting any such Capability Version numbers will contain a PCI Express Capability structure that is compatible with that piece of software. The controller hardwires this field to 2h for functions compliant to PCI Express Base Specification, Revision 4.0, Version 1.0. Note: This register field is sticky.
15:8	RO	0xb0	PCIE_CAP_NEXT_PTR Next Capability Pointer. This field contains the offset to the next PCI Capability structure or 00h if no other items exist in the linked list of Capabilities. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
7:0	RO	0x10	PCIE_CAP_ID Capability ID. Indicates the PCI Express Capability structure. This field must return a Capability ID of 10h indicating that this is a PCI Express Capability structure.

PCIE_DSP_PF0_PCIE_CAP_DEVICE_CAPABILITIES_REG

Address: Operational Base(0x00000070) + offset (0x0004)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	RSVDP_16 Reserved for future use.

Bit	Attr	Reset Value	Description
15	RO	0x1	PCIE_CAP_ROLE_BASED_ERR_REPORT Role-Based Error Reporting. When set, this bit indicates that the function implements the functionality originally defined in the Error Reporting ECN for PCI Express Base Specification, Revision 1.0a, and later incorporated into PCI Express Base Specification, Revision 1.1. This bit must be set by all functions conforming to the ECN, PCI Express Base Specification, Revision 1.1., or subsequent PCI Express Base Specification revisions. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
14:6	RO	0x000	RSVDP_6 Reserved for future use.
5	RO	0x0	PCIE_CAP_EXT_TAG_SUPP Extended Tag Field Supported. This bit, in combination with the 10-Bit Tag Requester Supported bit in the Device Capabilities 2 register, indicates the maximum supported size of the Tag field as a Requester. This bit must be set if the 10-Bit Tag Requester Supported bit is set. Note: 8-bit Tag field generation must be enabled by the Extended Tag Field Enable bit in the Device Control register of the Requester Function before 8-bit Tags can be generated by the Requester. See Section 2.2.6.2 of PCI Express Base Specification for interactions with enabling the use of 10-Bit Tags. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
4:3	RO	0x0	PCIE_CAP_PHANTOM_FUNC_SUPPORT Phantom Functions Supported. This field indicates the support for use of unclaimed function numbers to extend the number of outstanding transactions allowed by logically combining unclaimed function numbers (called Phantom Functions) with the Tag identifier (see Section 2.2.6.2 of PCI Express Base Specification for a description of Tag Extensions). With every Function in an ARI Device, the Phantom Functions Supported field must be set to 00b. The remainder of this field description applies only to non-ARI Multi-Function Devices. This field indicates the number of most significant bits of the Function Number portion of Requester ID that are logically combined with the Tag identifier. Note: Phantom Function support for the function must be enabled by the Phantom Functions Enable field in the Device Control register before the Function is permitted to use the Function Number field in the Requester ID for Phantom Functions. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
2:0	RO	0x0	PCIE_CAP_MAX_PAYLOAD_SIZE Max_Payload_Size Supported. This field indicates the maximum payload size that the function can support for TLPs. All encodings other than the defined encodings are reserved. The functions of a Multi-Function Device are permitted to report different values for this field. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.

PCIE_DSP_PF0_PCIE_CAP_DEVICE_CONTROL_DEVICE_STATUS

Address: Operational Base(0x00000070) + offset (0x0008)

Bit	Attr	Reset Value	Description
31:22	RO	0x000	RSVDP_22 Reserved for future use.
21	RO	0x0	PCIE_CAP_TRANS_PENDING Transactions Pending. Root and Switch Ports: The controller hardwires this bit to 0b.
20	RO	0x1	PCIE_CAP_AUX_POWER_DETECTED AUX Power Detected. Functions that require Aux power report this bit as set if Aux power is detected by the function. This bit is derived by sampling the sys_aux_pwr_det input.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
19	RW	0x0	PCIE_CAP_UNSUPPORTED_REQ_DETECTED Unsupported Request Detected. This bit indicates that the function received an Unsupported Request. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. For a Multi-Function Device, each function indicates status of errors as perceived by the respective function.
18	RW	0x0	PCIE_CAP_FATAL_ERR_DETECTED Fatal Error Detected. This bit indicates status of Fatal errors detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. For a Multi-Function device, each function indicates status of errors as perceived by the respective Function. For Functions supporting Advanced Error Handling, errors are logged in this register regardless of the settings of the Uncorrectable Error Mask register.
17	RW	0x0	PCIE_CAP_NON_FATAL_ERR_DETECTED Non-Fatal Error Detected. This bit indicates status of Non-fatal errors detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. For a Multi-Function device, each function indicates status of errors as perceived by the respective Function. For functions supporting Advanced Error Handling, errors are logged in this register regardless of the settings of the Uncorrectable Error Mask register.
16	RW	0x0	PCIE_CAP_CORR_ERR_DETECTED Correctable Error Detected. This bit indicates status of correctable errors detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. For a Multi-Function device, each function indicates status of errors as perceived by the respective function. For functions supporting Advanced Error Handling, errors are logged in this register regardless of the settings of the Correctable Error Mask register.
15	RO	0x0	reserved
14:12	RW	0x2	PCIE_CAP_MAX_READ_REQ_SIZE Max_Read_Request_Size. This field sets the maximum Read Request size for the function as a Requester. The function must not generate Read Requests with a size exceeding the set value. For functions that do not generate Read Requests larger than 128 bytes and functions that do not generate Read Requests on their own behalf, the controller implements this field as Read Only (RO) with a value of 000b.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
11	RO	0x0	PCIE_CAP_EN_NO_SNOOP Enable No Snoop. If this bit is set, the function is permitted to Set the No Snoop bit in the Requester Attributes of transactions it initiates that do not require hardware enforced cache coherency (see section 2.2.6.5 in PCI Express Base Specification). Note: Setting this bit to 1b should not cause a function to set the No Snoop attribute on all transactions that it initiates. Even when this bit is set, a function is only permitted to set the No Snoop attribute on a transaction when it can guarantee that the address of the transaction is not stored in any cache in the system. The controller hardwires this bit 0b if a function would never set the No Snoop attribute in transactions it initiates. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R
10	RW	0x0	PCIE_CAP_AUX_POWER_PM_EN Aux Power PM Enable. This bit is derived by sampling the sys_aux_pwr_det input. When set this bit, enables a function to draw Aux power independent of PME Aux power. Functions that require Aux power on legacy operating systems should continue to indicate PME Aux power requirements. Aux power is allocated as requested in the Aux_Current field of the Power Management Capabilities register (PMC), independent of the PME_En bit in the Power Management Control/Status register (PMCSR). For Multi-Function devices, a component is allowed to draw Aux power if at least one of the functions has this bit set. Note: Functions that consume Aux power must preserve the value of this sticky register when Aux power is available. In such functions, this bit is not modified by Conventional Reset. For functions that do not implement this capability, the controller hardwires this bit to 0b. Note: This register field is sticky.

Bit	Attr	Reset Value	Description
9	RO	0x0	PCIE_CAP_PHANTOM_FUNC_EN Phantom Functions Enable. This bit, in combination with the 10-Bit Tag Requester Enable bit in the Device Control 2 register, determines how many Tag field bits a Requester is permitted to use. When the 10-Bit Tag Requester Enable bit is clear, - If this bit is set, it enables a function to use unclaimed functions as Phantom functions to extend the number of outstanding transaction identifiers - If this bit is clear, the function is not allowed to use Phantom functions For more details, see section 2.2.6.2 of PCI Express Base Specification. Software should not change the value of this bit while the function has outstanding Non-Posted Requests; otherwise, the result is undefined. For functions that do not implement this capability, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: DEVICE_CAPABILITIES_REG.PCIE_CAP_PHANTOM_FUNC_SUPPORT ? RW : RO
8	RO	0x0	PCIE_CAP_EXT_TAG_EN Extended Tag Field Enable. This bit, in combination with the 10-Bit Tag Requester Enable bit in the Device Control 2 register, determines how many Tag field bits a Requester is permitted to use. When the 10-Bit Tag Requester Enable bit is clear, - If the Extended Tag Field Enable bit is set, the function is permitted to use an 8-bit Tag field as a Requester - If the Extended Tag Field Enable bit is clear, the Function is restricted to a 5-bit Tag field See section 2.2.6.2 of PCI Express Base Specification for required behavior when the 10-Bit Tag Requester Enable bit is set. If software changes the value of the Extended Tag Field Enable bit while the function has outstanding Non-Posted Requests, the result is undefined. For functions that do not implement this capability, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: DEVICE_CAPABILITIES_REG.PCIE_CAP_EXT_TAG_SUPP ? RW : RO

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
7:5	RW	0x0	PCIE_CAP_MAX_PAYLOAD_SIZE_CS Max_Payload_Size. This field sets maximum TLP payload size for the Function. As a Receiver, the Function must handle TLPs as large as the set value. As a Transmitter, the Function must not generate TLPs exceeding the set value. Permissible values that can be programmed are indicated by the Max_Payload_Size Supported field (PCIE_CAP_MAX_PAYLOAD_SIZE) in the Device Capabilities (DEVICE_CAPABILITIES_REG) register (for more details, see section 7.5.3.3 of PCI Express Base Specification). This field sets the maximum Read Request size for the function as a Requester. The function must not generate Read Requests with a size exceeding the set value. For Functions that support only the 128-byte max payload size, the controller hardwires this field to 000b. System software is not required to program the same value for this field for all the Functions of a Multi-Function device (for more details, see section 2.2.2 of PCI Express Base Specification). For ARI Devices, Max_Payload_Size is determined solely by the setting in Function0. The settings in the other Functions always return whatever value software programmed for each, but otherwise are ignored by the component. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W
4	RW	0x1	PCIE_CAP_EN_REL_ORDER Enable Relaxed Ordering. If this bit is set, the function is permitted to set the Relaxed Ordering bit in the Attributes field of transactions it initiates that do not require strong write ordering (for more details, see section 2.2.6.4 and section 2.4 of PCI Express Base Specification). For a function that never sets the Relaxed Ordering attribute in transactions it initiates as a Requester, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W
3	RW	0x0	PCIE_CAP_UNSUPPORT_REQ_REP_EN Unsupported Request Reporting Enable. This bit, in conjunction with other bits, controls the signaling of Unsupported Request Errors by sending error Messages (for more details, see section 6.2.5 and section 6.2.6 of PCI Express Base Specification). For a Multi-Function Device, this bit controls error reporting for each Function from point-of-view of the respective Function.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
2	RW	0x0	PCIE_CAP_FATAL_ERR_REPORT_EN Fatal Error Reporting Enable. This bit, in conjunction with other bits, controls sending ERR_FATAL Messages (for more details, see section 6.2.5 and section 6.2.6 of of PCI Express Base Specification). For a Multi-Function device, this bit controls error reporting for each function from point-of-view of the respective function. For a Root Port, the reporting of Fatal errors is internal to the root. No external ERR_FATAL Message is generated.
1	RW	0x0	PCIE_CAP_NON_FATAL_ERR_REPORT_EN Non-Fatal Error Reporting Enable. This bit, in conjunction with other bits, controls sending ERR_NONFATAL Messages (for more details, see section 6.2.5 and Section 6.2.6 of PCI Express Base Specification). For a Multi-Function Device, this bit controls error reporting for each function from point-of-view of the respective Function. For a Root Port, the reporting of Non-fatal errors is internal to the root. No external ERR_NONFATAL Message is generated.
0	RW	0x0	PCIE_CAP_CORR_ERR_REPORT_EN Correctable Error Reporting Enable. This bit, in conjunction with other bits, controls sending ERR_COR Messages (for more details, see section 6.2.5, section 6.2.6, and section 6.2.10.2 of PCI Express Base Specification). For a Multi-Function device, this bit controls error reporting for each function from point-of-view of the respective function. For a Root Port, the reporting of correctable errors is internal to the root. No external ERR_COR Message is generated.

PCIE_DSP_PF0_PCIE_CAP_LINK_CAPABILITIES_REG

Address: Operational Base(0x00000070) + offset (0x000C)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	PCIE_CAP_PORT_NUM Port Number. This field indicates the PCI Express Port number for the given PCI Express Link. Multi-Function Devices associated with an Upstream Port must report the same value in this field for all functions. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R
23	RO	0x0	RSVDP_23 Reserved for future use.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
22	RO	0x1	PCIE_CAP_ASPM_OPT_COMPLIANCE ASPM Optionality Compliance. This field must be set to 1b in all functions. Components implemented against certain earlier versions of this specification will have this bit set to 0b. Software is permitted to use the value of this bit to help determine whether to enable ASPM or whether to run ASPM compliance tests. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R
21	RO	0x1	PCIE_CAP_LINK_BW_NOT_CAP Link Bandwidth Notification Capability. A value of 1b indicates support for the Link Bandwidth Notification status and interrupt mechanisms. This capability is required for all Root Ports and Switch Downstream Ports supporting Links wider than x1 and/or multiple Link speeds. This field is not applicable and is Reserved for Endpoints, PCI Express to PCI/PCI-X bridges, and Upstream Ports of Switches. For functions that do not implement the Link Bandwidth Notification Capability the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
20	RO	0x1	PCIE_CAP_DLL_ACTIVE_REP_CAP Data Link Layer Link Active Reporting Capable. For a Downstream Port, the controller hardwires this bit to 1b if the component supports the optional capability of reporting the DL_Active state of the Data Link Control and Management State Machine. For a hot-plug capable Downstream Port (as indicated by the Hot-Plug Capable bit of the Slot Capabilities register) or a Downstream Port that supports Link speeds greater than 5.0 GT/s, the controller hardwires this bit to 1b. For Upstream Ports and components that do not support this optional capability, the controller hardwires this bit to 0b.
19	RO	0x0	PCIE_CAP_SURPRISE_DOWN_ERR_REP_CAP Surprise Down Error Reporting Capable. For a Downstream Port, this bit must be set if the component supports the optional capability of detecting and reporting a Surprise Down error condition. For Upstream Ports and components that do not support this optional capability, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
18	RO	0x0	PCIE_CAP_CLOCK_POWER_MAN Clock Power Management. For Upstream Ports, a value of 1b in this bit indicates that the component tolerates the removal of any reference clock(s) via the "clock request" (CLKREQ#) mechanism when the Link is in the L1 and L2/L3 Ready Link states. A value of 0b indicates the component does not have this capability and that reference clock(s) must not be removed in these Link states. L1 PM Substates defines other semantics for the CLKREQ# signal, which are managed independently of Clock Power Management. This Capability is applicable only in form factors that support "clock request" (CLKREQ#) capability. For a Multi-Function device associated with an Upstream Port, each Function indicates its capability independently. Power Management configuration software must only permit reference clock removal if all functions of the Multi-Function device indicate a 1b in this bit. For ARI Devices, all Functions must indicate the same value in this bit. For Downstream Ports, the controller hardwires this bit to 0b. Note: This register field is sticky.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
17:15	RO	0x5	PCIE_CAP_L1_EXIT_LATENCY L1 Exit Latency. This field indicates the L1 exit latency for the given PCI Express Link. The value reported indicates the length of time this Port requires to complete transition from ASPM L1 to L0. If ASPM L1 is not supported, the value is undefined. Note: Exit latencies may be influenced by PCI Express reference clock configuration depending upon whether a component uses a common or separate reference clock. Multi-Function Devices associated with an Upstream Port must report the same value in this field for all functions. There are two each of these register fields, this one and a shadow one at the same address. The Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG) determines which one is used by the controller and which one is accessed by a read request. Common Clock operation is supported (possible) in the controller when one or more of the following expressions is true: - CX_NFTS !=CX_COMM_NFTS - DEFAULT_L0S_EXIT_LATENCY !=DEFAULT_COMM_L0S_EXIT_LATENCY - DEFAULT_L1_EXIT_LATENCY !=DEFAULT_COMM_L1_EXIT_LATENCY Common Clock operation is enabled in the controller when you set the Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG). The assertion of CS2 (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) is required to write to the shadow field at this location. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
14:12	RO	0x2	PCIE_CAP_L0S_EXIT_LATENCY L0s Exit Latency. This field indicates the L0s exit latency for the given PCI Express Link. The value reported indicates the length of time this Port requires to complete transition from L0s to L0. If L0s is not supported, the value is undefined; however, see the Implementation Note "Potential Issues With Legacy Software When L0s is Not Supported" in section 5.4.1.1 of PCI Express Base Specification for the recommended value. Note: Exit latencies may be influenced by PCI Express reference clock configuration depending upon whether a component uses a common or separate reference clock. Multi-Function Devices associated with an Upstream Port must report the same value in this field for all functions. There are two each of these register fields, this one and a shadow one at the same address. The Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG) determines which one is used by the controller and which one is accessed by a read request. Common Clock operation is supported (possible) in the controller when one or more of the following expressions is true: - CX_NFTS !=CX_COMM_NFTS - DEFAULT_L0S_EXIT_LATENCY !=DEFAULT_COMM_L0S_EXIT_LATENCY - DEFAULT_L1_EXIT_LATENCY !=DEFAULT_COMM_L1_EXIT_LATENCY Common Clock operation is enabled in the controller when you set the Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG). The assertion of CS2 (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) is required to write to the shadow field at this location. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
11:10	RO	0x3	PCIE_CAP_ACTIVE_STATE_LINK_PM_SUPPORT Active State Power Management (ASPM) Support. This field indicates the level of ASPM supported on the given PCI Express Link. For more details on ASPM support requirements, see section 5.4.1 of PCI Express Base Specification. Multi-Function devices associated with an Upstream Port must report the same value in this field for all functions. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
9:4	RO	0x01	PCIE_CAP_MAX_LINK_WIDTH Maximum Link Width. This field indicates the maximum Link width (xN - corresponding to N Lanes) implemented by the component. This value is permitted to exceed the number of Lanes routed to the slot (Downstream Port), adapter connector (Upstream Port), or in the case of component-to-component connections, the actual wired connection width. All encodings other than the defined encodings are reserved. Multi-Function devices associated with an Upstream Port must report the same value in this field for all functions. In M-PCIe mode, the reset and dynamic values of this field are calculated by the controller. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
3:0	RO	0x3	PCIE_CAP_MAX_LINK_SPEED Max Link Speed. This field indicates the maximum Link speed of the associated Port. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the maximum Link speed. All encodings other than the defined encodings are reserved. Multi-Function Devices associated with an Upstream Port must report the same value in this field for all functions. In M-PCIe mode, the reset and dynamic values of this field are calculated by the controller. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.

PCIE_DSP_PF0_PCIE_CAP_LINK_CONTROL_LINK_STATUS_REG

Address: Operational Base(0x00000070) + offset (0x0010)

Bit	Attr	Reset Value	Description
31	RW	0x0	PCIE_CAP_LINK_AUTO_BW_STATUS Link Autonomous Bandwidth Status. This bit is set by hardware to indicate that hardware has autonomously changed Link speed or width, without the Port transitioning through DL_Down status, for reasons other than to attempt to correct unreliable Link operation. This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was indicated as an autonomous change. The write value is gated with the PCIE_CAP_LINK_BW_NOT_CAP field in LINK_CAPABILITIES_REG.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
			This bit is not applicable and is Reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. For functions that do not implement the Link Bandwidth Notification Capability, the controller hardwires this bit to 0b.
30	RW	0x0	PCIE_CAP_LINK_BW_MAN_STATUS Link Bandwidth Management Status. This bit is set by hardware to indicate that either of the following has occurred without the Port transitioning through DL_Down status: - A Link retraining has completed following a write of 1b to the Retrain Link bit. Note: This bit is set following any write of 1b to the Retrain Link bit, including when the Link is in the process of retraining for some other reason. - Hardware has changed Link speed or width to attempt to correct unreliable Link operation, either through an LTSSM timeout or a higher level process. This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was not indicated as an autonomous change. This bit is not applicable and is Reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. For functions that do not implement the Link Bandwidth Notification Capability, the controller hardwires this bit to 0b. The default value of this bit is 0b. The write value is gated with the PCIE_CAP_LINK_BW_NOT_CAP field in LINK_CAPABILITIES_REG.
29	RO	0x0	PCIE_CAP_DLL_ACTIVE Data Link Layer Link Active. This bit indicates the status of the Data Link Control and Management State Machine. It returns a 1b to indicate the DL_Active state, 0b otherwise. This bit must be implemented if the Data Link Layer Link Active Reporting Capable bit is 1b. Otherwise, the controller hardwires it to 0b.
28	RO	0x1	PCIE_CAP_SLOT_CLK_CONFIG Slot Clock Configuration. This bit indicates that the component uses the same physical reference clock that the platform provides on the connector. If the device uses an independent clock irrespective of the presence of a reference clock on the connector, this bit must be clear. For a Multi-Function Device, each Function must report the same value for this bit. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R

Bit	Attr	Reset Value	Description
27	RO	0x0	PCIE_CAP_LINK_TRAINING Link Training. This read-only bit indicates that the Physical Layer LTSSM is in the Configuration or Recovery state, or that 1b was written to the Retrain Link bit but Link training has not yet begun. Hardware clears this bit when the LTSSM exits the Configuration/Recovery state. This bit is not applicable and Reserved for Endpoints, PCI Express to PCI/PCI-X bridges, and Upstream Ports of Switches, and the controller hardwires it to 0b.
26	RO	0x0	RSVDP_26 Reserved for future use.
25:20	RO	0x01	PCIE_CAP_NEGO_LINK_WIDTH Negotiated Link Width. This field indicates the negotiated width of the given PCI Express Link. All encodings other than the defined encodings are reserved. The value in this field is undefined when the Link is not up.
19:16	RO	0x1	PCIE_CAP_LINK_SPEED Current Link Speed. This field indicates the negotiated Link speed of the given PCI Express Link. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. All encodings other than the defined encodings are reserved. The value in this field is undefined when the Link is not up.
15:14	RW	0x0	PCIE_CAP_DRS_SIGNALING_CONTROL DRS Signaling Control. Indicates the mechanism used to report reception of a DRS message. Must be implemented for Downstream Ports with the DRS Supported bit Set in the Link Capabilities 2 Register. Encodings are: If DRS Supported is set, receiving a DRS Message will set DRS Message Received in the Link Status 2 Register but will otherwise have no effect If the DRS Message Received bit in the Link Status 2 Register transitions from 0 to 1, and either MSI or MSI-X is enabled, an MSI or MSI-X interrupt is generated using the vector in Interrupt Message Number (section 7.5.3.2) If the DRS Message Received bit in the Link Status 2 Register transitions from 0 to 1, the Port must send an FRS Message Upstream with the FRS Reason field set to DRS Message Received. Behavior is undefined if this field is set to 10b and the FRS Supported bit in the Device Capabilities 2 Register is Clear. Behavior is undefined if this field is set to 11b. For Downstream Ports with the DRS Supported bit clear in the Link Capabilities 2 register, the controller hardwires this field to 00b. This field is Reserved for Upstream Ports. Note: The access attributes of this field are as follows:

Bit	Attr	Reset Value	Description
9	RW	0x0	PCIE_CAP_HW_AUTO_WIDTH_DISABLE Hardware Autonomous Width Disable. When set, this bit disables hardware from changing the Link width for reasons other than attempting to correct unreliable Link operation by reducing Link width. For a Multi-Function Device associated with an Upstream Port, the bit in Function 0 is of type RW, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this bit is of type RsvdP. For components that do not implement the ability autonomously to change Link width, the ciontroller hardwires this bit to 0b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W
8	RW	0x0	PCIE_CAP_EN_CLK_POWER_MAN Enable Clock Power Management. Applicable only for Upstream Ports and with form factors that support a "Clock Request" (CLKREQ#) mechanism, this bit operates as follows: For a non-ARI Multi-Function Device, power-management-configuration software must only Set this bit if all Functions of the Multi-Function Device indicate a 1b in the Clock Power Management bit of the Link Capabilities register. The component is permitted to use the CLKREQ# signal to power manage Link clock only if this bit is Set for all Functions. For ARI Devices, Clock Power Management is enabled solely by the setting in Function 0. The settings in the other Functions always return whatever value software programmed for each, but otherwise are ignored by the component. The CLKREQ# signal may also be controlled via the L1 PM Substates mechanism. Such control is not affected by the setting of this bit. For Downstream Ports and components that do not support Clock Power Management (as indicated by a 0b value in the Clock Power Management bit of the Link Capabilities register), the controller hardwires this bit to 0b. The write value is gated with the PCIE_CAP_CLOCK_POWER_MAN field in LINK_CAPABILITIES_REG. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: LINK_CAPABILITIES_REG.PCIE_CAP_CLOCK_POWER_MAN ? RWS : ROS Note: This register field is sticky.

Bit	Attr	Reset Value	Description
7	RW	0x0	PCIE_CAP_EXTENDED_SYNCH Extended Synch. When set, this bit forces the transmission of additional Ordered Sets when exiting the L0s state (see section 4.2.4.5 of PCI Express Base Specification) and when in the Recovery state (see section 4.2.6.4.1 of PCI Express Base Specification). This mode provides external devices (for example, logic analyzers) monitoring the Link time to achieve bit and Symbol lock before the Link enters the L0 state and resumes communication. For Multi-Function devices if any function has this bit set, then the component must transmit the additional Ordered Sets when exiting L0s or when in Recovery.
6	RW	0x0	PCIE_CAP_COMMON_CLK_CONFIG Common Clock Configuration. When set, this bit indicates that this component and the component at the opposite end of this Link are operating with a distributed common reference clock. A value of 0b indicates that this component and the component at the opposite end of this Link are operating with asynchronous reference clock. For non-ARI Multi-Function Devices, software must program the same value for this bit in all Functions. If not all Functions are Set, then the component must as a whole assume that its reference clock is not common with the Upstream component. For ARI Devices, Common Clock Configuration is determined solely by the setting in Function 0. The settings in the other Functions always return whatever value software programmed for each, but otherwise are ignored by the component. Components utilize this common clock configuration information to report the correct L0s and L1 Exit Latencies. After changing the value in this bit in both components on a Link, software must trigger the Link to retrain by writing a 1b to the Retrain Link bit of the Downstream Port.
5	RW	0x0	PCIE_CAP_RETRAIN_LINK Retrain Link. A write of 1b to this bit initiates Link retraining by directing the Physical Layer LTSSM to the Recovery state. If the LTSSM is already in Recovery or Configuration, re-entering Recovery is permitted but not required. If the Port is in DPC when a write of 1b to this bit occurs, the result is undefined. Reads of this bit always return 0b. It is permitted to write 1b to this bit while simultaneously writing modified values to other fields in this register. If the LTSSM is not already in Recovery or Configuration, the resulting Link training must use the modified values. If the LTSSM is already in Recovery or Configuration, the modified values are not required to affect the Link training that's already in progress. This bit is not applicable and is Reserved for Endpoints, PCI

Bit	Attr	Reset Value	Description
1:0	RW	0x0	PCIE_CAP_ACTIVE_STATE_LINK_PM_CONTROL Active State Power Management (ASPM) Control. This field controls the level of ASPM enabled on the given PCI Express Link. See section 5.4.1.3 of PCI Express Base Specification for requirements on when and how to enable ASPM. Note: "L0s Entry Enabled" enables the Transmitter to enter L0s. If L0s is supported, the Receiver must be capable of entering L0s even when the Transmitter is disabled from entering L0s (00b or 10b). ASPM L1 must be enabled by software in the Upstream component on a Link prior to enabling ASPM L1 in the Downstream component on that Link. When disabling ASPM L1, software must disable ASPM L1 in the Downstream component on a Link prior to disabling ASPM L1 in the Upstream component on that Link. ASPM L1 must only be enabled on the Downstream component if both components on a Link support ASPM L1. For Multi-Function Devices (including ARI Devices), it is recommended that software program the same value for this field in all Functions. For non-ARI Multi-Function Devices, only capabilities enabled in all Functions are enabled for the component as a whole. For ARI Devices, ASPM Control is determined solely by the setting in Function0, regardless of Function 0's D-state. The settings in the other Functions always return whatever value software programmed for each, but otherwise are ignored by the component. Software must not enable L0s in either direction on a given Link unless components on both sides of the Link each support L0s; otherwise, the result is undefined.

PCIE_DSP_PF0_PCIE_CAP_SLOT_CONTROL_SLOT_STATUS

Address: Operational Base(0x00000070) + offset (0x0018)

Bit	Attr	Reset Value	Description
31:25	RO	0x00	RSVDP_25 Reserved for future use.
24	RW	0x0	PCIE_CAP_DLL_STATE_CHANGED Data Link Layer State Changed. This bit is set when the value reported in the Data Link Layer Link Active bit of the Link Status register is changed. In response to a Data Link Layer State Changed event, software must read the Data Link Layer Link Active bit of the Link Status register to determine if the Link is active before initiating configuration cycles to the hot plugged device.
23	RO	0x0	PCIE_CAP_ELECTROMECH_INTERLOCK_STATUS Electromechanical Interlock Status. If an Electromechanical Interlock is implemented, this bit indicates the status of the Electromechanical Interlock.
22	RO	0x1	PCIE_CAP_PRESENCE_DETECT_STATE Presence Detect State. This bit indicates the presence of an adapter in the slot, reflected by the logical "OR" of the Physical Layer in-band presence detect mechanism and, if present, any out-of-band presence detect mechanism defined for the slot's corresponding form factor. Note that the in-band presence detect mechanism requires that power be applied to an adapter for its presence to be detected. Consequently, form factors that require a power controller for hot-plug must implement a physical pin presence detect mechanism. This bit must be implemented on all Downstream Ports that implement slots. For Downstream Ports not connected to slots (where the Slot Implemented bit of the PCI Express Capabilities register is 0b), the controller hardwires this bit to 1b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R
21	RO	0x0	PCIE_CAP_MRL_SENSOR_STATE MRL Sensor State. This bit reports the status of the MRL sensor if implemented. Encodings are define as above.
20	RW	0x0	PCIE_CAP_CMD_CPLD Command Completed. If Command Completed notification is supported (if the No Command Completed Support bit in the Slot Capabilities register is 0b), this bit is set when a hot-plug command has completed and the Hot-Plug Controller is ready to accept a subsequent command. The Command Completed status bit is set as an indication to host software that the Hot-Plug Controller has processed the previous command and is ready to receive the next command; it provides no guarantee that the action corresponding to the command is complete. If Command Completed notification is not supported, the controller hardwires this bit to 0b.

3	RW	0x0	PCIE_CAP_PME_INT_EN PME Interrupt Enable. When set, this bit enables PME interrupt generation upon receipt of a PME Message as reflected in the PME Status bit (for more details, see Table 7-29 of PCI Express Base Specification). A PME interrupt is also generated if the PME Status bit is set when this bit is changed from clear to set.
2	RW	0x0	PCIE_CAP_SYS_ERR_ON_FATAL_ERR_EN System Error on Fatal Error Enable. If set, this bit indicates that a System Error should be generated if a Fatal error (ERR_FATAL) is reported by any of the devices in the Hierarchy Domain associated with this Root Port, or by the Root Port itself. The mechanism for signaling a System Error to the system is system specific.
1	RW	0x0	PCIE_CAP_SYS_ERR_ON_NON_FATAL_ERR_EN System Error on Non-Fatal Error Enable. If set, this bit indicates that a System Error should be generated if a Non-fatal error (ERR_NONFATAL) is reported by any of the devices in the Hierarchy Domain associated with this Root Port, or by the Root Port itself. The mechanism for signaling a System Error to the system is system specific.
0	RW	0x0	PCIE_CAP_SYS_ERR_ON_CORR_ERR_EN System Error on Correctable Error Enable. If set, this bit indicates that a System Error should be generated if a correctable error (ERR_COR) is reported by any of the devices in the Hierarchy Domain associated with this Root Port, or by the Root Port itself. The mechanism for signaling a System Error to the system is system specific.

PCIE_DSP_PF0_PCIE_CAP_ROOT_STATUS_REG

Address: Operational Base(0x00000070) + offset (0x0020)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	RSVDP_18 Reserved for future use.
17	RO	0x0	PCIE_CAP_PME_PENDING PME Pending. This bit indicates that another PME is pending when the PME Status bit is s et. When the PME Status bit is cleared by software; the PME is delivered by hardware by setting the PME Status bit again and updating the PME Requester ID field appropriately. The PME Pending bit is cleared by hardware if no more PMEs are pending.
16	RW	0x0	PCIE_CAP_PME_STATUS PME Status. This bit indicates that PME was asserted by the PME Requester indicated in the PME Requester ID field. Subsequent PMEs are kept pending until the status register is cleared by software by writing a 1b.
15:0	RO	0x0000	PCIE_CAP_PME_REQ_ID PME Requester ID. This field indicates the PCI Requester ID of the last PME Requester. This field is only valid when the PME Status bit is set.

PCIE_DSP_PF0_PCIE_CAP_DEVICE_CAPABILITIES2_REG

Address: Operational Base(0x00000070) + offset (0x0024)

Bit	Attr	Reset Value	Description
23:20	RO	0x0	reserved
19:18	RO	0x3	PCIE_CAP_OBFF_SUPPORT OBFF Supported. This field indicates if OBFF is supported and, if so, what signaling mechanism is used. The value reported in this field must indicate support for WAKE# signaling only if: - for a Downstream Port, driving the WAKE# signal for OBFF is supported and the connector or component connected Downstream is known to receive that same WAKE# signal - for an Upstream Port, receiving the WAKE# signal for OBFF is supported and, if the component is on an add-in-card, that the component is connected to the WAKE# signal on theconnector. Root Ports, Switch Ports, and Endpoints are permitted to implement this capability. For a Multi-Function Device associated with an Upstream Port, each Function must report the same value for this field. For Bridges and Ports that do not implement this capability, the controller hardwires this field to 00b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W(Sticky) else R(Sticky) Note: This register field is sticky.
17	RO	0x0	PCIE_CAP2_10_BIT_TAG_REQ_SUPPORT 10-Bit Tag Requester Supported. If this bit is set, the Function supports 10-Bit Tag Requester capability; otherwise, the Function does not. This bit must not be set if the 10-Bit Tag Completer Supported bit is clear. Note: 10-Bit Tag field generation must be enabled by the 10-Bit Tag Requester Enable bit in the Device Control 2 register of the Requester Function before 10-Bit Tags can be generated by the Requester. For more details, see section 2.2.6.2. of PCI Express Base Specification.
16	RO	0x0	PCIE_CAP2_10_BIT_TAG_COMP_SUPPORT 10-Bit Tag Completer Supported. If this bit is set, the Function supports 10-Bit Tag Completer capability; otherwise, the Function does not. For more details, see section 2.2.6.2. of PCI Express Base Specification.
15:14	RO	0x0	reserved
13	RO	0x0	PCIE_CAP_TPH_CMPLT_SUPPORT_1 TPH Completer Supported Bit 1.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
12	RO	0x0	PCIE_CAP_TPH_CMPLT_SUPPORT_0 TPH Completer Supported Bit 0. Value of this bit along with TPH Completer Supported Bit 1 indicates Completer support for TPH or Extended TPH. Applicable only to Root Ports and Endpoints. For all other Functions, this field is Reserved. For more details, see section 6.17 of PCI Express Base Specification.
11	RO	0x1	PCIE_CAP_LTR_SUPP LTR Mechanism Supported. A value of 1b indicates support for the optional Latency Tolerance Reporting (LTR) mechanism. Root Ports, Switches and Endpoints are permitted to implement this capability. For a Multi-Function Device associated with an Upstream Port, each Function must report the same value for this bit. For Bridges and other Functions that do not implement this capability, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W(Sticky) else R(Sticky) Note: This register field is sticky.
10	RO	0x1	PCIE_CAP_NO_RO_EN_PR2PR_PAR No RO-enabled PR-PR Passing. If this bit is set, the routing element never carries out the passing permitted by Table 2-39 of PCI Express Base Specification entry A2b that is associated with the Relaxed Ordering Attribute field being Set. This bit applies only for Switches and RCs that support peer-to-peer traffic between Root Ports. This bit applies only to Posted Requests being forwarded through the Switch or RC and does not apply to traffic originating or terminating within the Switch or RC itself. All Ports on a Switch or RC must report the same value for this bit. For all other functions, this bit must be 0b.
9	RO	0x0	PCIE_CAP_128_CAS_CPL_SUPP 128-bit CAS Completer Supported. Applicable to Functions with Memory Space BARs as well as all Root Ports; must be 0b otherwise. This bit must be set to 1b if the Function supports this optional capability. For more details, see section 6.15 of PCI Express Base Specification.
8	RO	0x0	PCIE_CAP_64_ATOMIC_CPL_SUPP 64-bit AtomicOp Completer Supported. Applicable to Functions with Memory Space BARs as well as all Root Ports; must be 0b otherwise. Includes FetchAdd, Swap, and CAS AtomicOps. This bit must be set to 1b if the Function supports this optional capability. For more details on additional RC requirements, see section 6.15.3.1 of PCI Express Base Specification.
7	RO	0x0	PCIE_CAP_32_ATOMIC_CPL_SUPP 32-bit AtomicOp Completer Supported. Applicable to Functions with Memory Space BARs as well as all Root Ports; must be 0b otherwise. Includes FetchAdd, Swap, and CAS AtomicOps. This bit must be set to 1b if the Function supports this optional capability. For more details on additional RC requirements, see section 6.15.3.1 of PCI Express Base Specification.

Bit	Attr	Reset Value	Description
6	RO	0x0	PCIE_CAP_ATOMIC_ROUTING_SUPP AtomicOp Routing Supported. Applicable only to Switch Upstream Ports, Switch Downstream Ports, and Root Ports; must be 0b for other Function types. This bit must be set to 1b if the Port supports this optional capability. For more details, see section 6.15 of PCI Express Base Specification.
5	RO	0x0	PCIE_CAP_ARI_FORWARD_SUPPORT ARI Forwarding Supported. Applicable only to Switch Downstream Ports and Root Ports; must be 0b for other Function types. This bit must be set to 1b if a Switch Downstream Port or Root Port supports this optional capability. For more details, see section 6.13 of PCI Express Base Specification.
4	RO	0x1	PCIE_CAP_CPL_TIMEOUT_DISABLE_SUPPORT Completion Timeout Disable Supported. A value of 1b indicates support for the Completion Timeout Disable mechanism. The Completion Timeout Disable mechanism is required for Endpoints that issue Requests on their own behalf and PCI Express to PCI/PCI-X Bridges that take ownership of Requests issued on PCI Express. This mechanism is optional for Root Ports. For all other Functions this field is Reserved and the controller hardwires this bit to 0b.
3:0	RO	0x0	PCIE_CAP_CPL_TIMEOUT_RANGE Completion Timeout Ranges Supported. This field indicates device Function support for the optional Completion Timeout programmability mechanism. This mechanism allows system software to modify the Completion Timeout value. This field is applicable only to Root Ports, Endpoints that issue Requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of Requests issued on PCI Express. For all other Functions this field is Reserved and must be hardwired to 0000b. Four time value ranges are defined: - Range A: 50 us to 10 ms - Range B: 10 ms to 250 ms - Range C: 250 ms to 4 s - Range D: 4 s to 64 s Bits are set according to the list below to show timeout value ranges supported. All encodings other than the defined encodings are reserved. It is strongly recommended that the Completion Timeout mechanism not expire in less than 10 ms.

8	RO	0x0	PCIE_CAP_CROSS_LINK_SUPPORT Crosslink Supported. When set to 1b, this bit indicates that the associated Port supports crosslinks (for more details, see section 4.2.6.3.1 of PCI Express Base Specification). When set to 0b on a Port that supports Link speeds of 8.0 GT/s or higher, this bit indicates that the associated Port does not support crosslinks. When set to 0b on a Port that only supports Link speeds of 2.5 GT/s or 5.0 GT/s, this bit provides no information regarding the Port's level of crosslink support. It is recommended that this bit be Set in any Port that supports crosslinks even though doing so is only required for Ports that also support operating at 8.0 GT/s or higher Link speeds. Note: Software should use this bit when referencing fields whose definition depends on whether or not the Port supports crosslinks (for more details, see section 7.7.3.4 of PCI Express Base Specification). Multi-Function Devices associated with an Upstream Port must report the same value in this field for all Functions.
7:1	RO	0x07	PCIE_CAP_SUPPORT_LINK_SPEED_VECTOR Supported Link Speeds Vector. This field indicates the supported Link speed(s) of the associated Port. For each bit, a value of 1b indicates that the corresponding Link speed is supported; otherwise, the Link speed is not supported. For more details, see section 8.2.1 of PCI Express Base Specification. Bit definitions within this field are: - Bit 0 2.5 GT/s - Bit 1 5.0 GT/s - Bit 2 8.0 GT/s - Bit 3 16.0 GT/s - Bit 4 32.0 GT/s - Bits 6:5 RsvdP Multi-Function Devices associated with an Upstream Port must report the same value in this field for all Functions. This field has a default of (PCIE_CAP_MAX_LINK_SPEED == 0101) ? 0011111 : (PCIE_CAP_MAX_LINK_SPEED == 0100) ? 0001111 : (PCIE_CAP_MAX_LINK_SPEED == 0011) ? 0000111 : (PCIE_CAP_MAX_LINK_SPEED == 0010) ? 0000011 : 0000001 where PCIE_CAP_MAX_LINK_SPEED is a field in the LINK_CAPABILITIES_REG register.

Bit	Attr	Reset Value	Description
3:0	RW	0x3	PCIE_CAP_TARGET_LINK_SPEED Target Link Speed. For Downstream Ports, this field sets an upper limit on Link operational speed by restricting the values advertised by the Upstream component in its training sequences. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the desired target Link speed. All encodings other than the defined encodings are reserved. If a value is written to this field that does not correspond to a supported speed (as indicated by the Supported Link Speeds Vector), the result is undefined. If either of the Enter Compliance or Enter Modified Compliance bits are implemented, then this field must also be implemented. The default value of this field is the highest Link speed supported by the component (as reported in the Max Link Speed field of the Link Capabilities register) unless the corresponding platform/form factor requires a different default value. For both Upstream and Downstream Ports, this field is used to set the target compliance mode speed when software is using the Enter Compliance bit to force a Link into compliance mode. For Upstream Ports, if the Enter Compliance bit is Clear, this field is permitted to have no effect. For a Multi-Function Device associated with an Upstream Port, the field in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this field is of type RsvdP. Components that support only the 2.5 GT/s speed are permitted to hardwire this field to 0000b. In M-PCIe mode, the contents of this field are derived from other registers. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W (sticky) Note: This register field is sticky.

14.4.3.5 PCIE_DSP_PF0_PCIE_CAP Register Description

14.4.3.5.1 Registers Summary

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_PCIE_CAP_PCIE_CAP_ID_PCIE_NEXT_CAP_PTR_PCIE_CAP_REG	0x0000	W	0x0042B010	This is the PCI Express Capabilities, ID, and Next Pointer Register.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_PCIE_CAP_DEVICE_CAPABILITIES_REG	0x0004	W	0x00008000	The Device Capabilities register identifies PCI Express device function specific capabilities.
PCIE_DSP_PF0_PCIE_CAP_DEVICE_CONTROL_DEVICE_STATUS	0x0008	W	0x00102010	This register controls PCI Express device specific parameters and provides information about PCI Express device (function) specific parameters.
PCIE_DSP_PF0_PCIE_CAP_LINK_CAPABILITIES_REG	0x000C	W	0x0072AC13	The Link Capabilities register identifies PCI Express Link specific capabilities.
PCIE_DSP_PF0_PCIE_CAP_LINK_CONTROL_LINK_STATUS_REG	0x0010	W	0x10110000	This register controls and provides information about PCI Express Link specific parameters.
PCIE_DSP_PF0_PCIE_CAP_SLOT_CAPABILITIES_REG	0x0014	W	0x00000000	The Slot Capabilities register identifies PCI Express slot specific capabilities.
PCIE_DSP_PF0_PCIE_CAP_SLOT_CONTROL_SLOT_STATUS	0x0018	W	0x004003C0	This register controls and provides information about PCI Express Slot specific parameters.
PCIE_DSP_PF0_PCIE_CAP_ROOT_CONTROL_ROOT_CAPABILITIES_REG	0x001C	W	0x00010000	This register controls PCI Express Root Complex specific parameters and identifies PCI Express Root Port specific capabilities.
PCIE_DSP_PF0_PCIE_CAP_ROOT_STATUS_REG	0x0020	W	0x00000000	The Root Status register provides information about PCI Express device specific parameters.
PCIE_DSP_PF0_PCIE_CAP_DEVICE_CAPABILITIES2_REG	0x0024	W	0x000C0C10	This register identifies PCI Express device specific capabilities; in addition to the Device Capabilities Register.
PCIE_DSP_PF0_PCIE_CAP_DEVICE_CONTROL2_DEVICE_STATUS2_REG	0x0028	W	0x00000000	This register controls PCI Express device specific parameters and provides information about PCI Express device (function) specific parameters; in addition to the Device Control and Device Status Register.
PCIE_DSP_PF0_PCIE_CAP_LINK_CAPABILITIES2_REG	0x002C	W	0x0000000E	This register identifies PCI Express Link specific capabilities; in addition to the Link Capabilities Register.
PCIE_DSP_PF0_PCIE_CAP_LINK_CONTROL2_LINK_STATUS2_REG	0x0030	W	0x00010003	This register controls and provides information about PCI Express Link specific parameters; in addition to the Link Control and Link Status Register.

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

14.4.3.5.2 Detail Registers Description

PCIE_DSP_PF0_PCIE_CAP_PCIE_CAP_ID_PCIE_NEXT_CAP_PTR_PCIE_CAP_REG

Address: Operational Base(0x00000070) + offset (0x0000)

Bit	Attr	Reset Value	Description
31	RO	0x0	RSVDP_31 Reserved for future use.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
30	RO	0x0	RSVD Reserved.
29:25	RO	0x00	PCIE_INT_MSG_NUM PCIE Interrupt Message Number. Interrupt Message Number. This field indicates which MSI/MSI-X vector is used for the interrupt message generated in association with any of the status bits of this Capability structure. For MSI, the value in this field indicates the offset between the base Message Data and the interrupt message that is generated. Hardware is required to update this field so that it is correct if the number of MSI Messages assigned to the Function changes when software writes to the Multiple Message Enable field in the MSI Message Control register. For MSI-X, the value in this field indicates which MSI-X Table entry is used to generate the interrupt message. The entry must be one of the first 32 entries even if the Function implements more than 32 entries. For a given MSI-X implementation, the entry must remain constant. If both MSI and MSI-X are implemented, they are permitted to use different vectors, though software is permitted to enable only one mechanism at a time. If MSI-X is enabled, the value in this field must indicate the vector for MSI-X. If MSI is enabled or neither is enabled, the value in this field must indicate the vector for MSI. If software enables both MSI and MSI-X at the same time, the value in this field is undefined. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
24	RO	0x0	PCIE_SLOT_IMP Slot Implemented. When set, this bit indicates that the Link associated with this Port is connected to a slot (as compared to being connected to a system-integrated device or being disabled). This bit is valid for Downstream Ports. This bit is undefined for Upstream Ports. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
23:20	RO	0x4	PCIE_DEV_PORT_TYPE Device/Port Type. Indicates the specific type of this PCI Express function. Note: Different functions in a Multi-Function Device can generally be of different types. Defined encodings for functions that implement a Type 00h PCI Configuration Space header are: Defined encodings for functions that implement a Type 01h PCI Configuration Space header are: All other encodings are Reserved. Note: Different Endpoint types have notably different requirements in Section 1.3.2 of PCI Express Base Specification regarding I/O resources, Extended Configuration Space, and other capabilities.
19:16	RO	0x2	PCIE_CAP_REG Capability Version. Indicates PCI-SIG defined PCI Express Capability structure version number. A version of the specification that changes the PCI Express Capability structure in a way that is not otherwise identifiable (for example, through a new Capability field) is permitted to increment this field. All such changes to the PCI Express Capability structure must be software-compatible. Software must check for Capability Version numbers that are greater than or equal to the highest number defined when the software is written, as functions reporting any such Capability Version numbers will contain a PCI Express Capability structure that is compatible with that piece of software. The controller hardwires this field to 2h for functions compliant to PCI Express Base Specification, Revision 4.0, Version 1.0. Note: This register field is sticky.
15:8	RO	0xb0	PCIE_CAP_NEXT_PTR Next Capability Pointer. This field contains the offset to the next PCI Capability structure or 00h if no other items exist in the linked list of Capabilities. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
7:0	RO	0x10	PCIE_CAP_ID Capability ID. Indicates the PCI Express Capability structure. This field must return a Capability ID of 10h indicating that this is a PCI Express Capability structure.

PCIE_DSP_PF0_PCIE_CAP_DEVICE_CAPABILITIES_REG

Address: Operational Base(0x00000070) + offset (0x0004)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	RSVDP_16 Reserved for future use.

Bit	Attr	Reset Value	Description
15	RO	0x1	PCIE_CAP_ROLE_BASED_ERR_REPORT Role-Based Error Reporting. When set, this bit indicates that the function implements the functionality originally defined in the Error Reporting ECN for PCI Express Base Specification, Revision 1.0a, and later incorporated into PCI Express Base Specification, Revision 1.1. This bit must be set by all functions conforming to the ECN, PCI Express Base Specification, Revision 1.1., or subsequent PCI Express Base Specification revisions. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
14:6	RO	0x000	RSVDP_6 Reserved for future use.
5	RO	0x0	PCIE_CAP_EXT_TAG_SUPP Extended Tag Field Supported. This bit, in combination with the 10-Bit Tag Requester Supported bit in the Device Capabilities 2 register, indicates the maximum supported size of the Tag field as a Requester. This bit must be set if the 10-Bit Tag Requester Supported bit is set. Note: 8-bit Tag field generation must be enabled by the Extended Tag Field Enable bit in the Device Control register of the Requester Function before 8-bit Tags can be generated by the Requester. See Section 2.2.6.2 of PCI Express Base Specification for interactions with enabling the use of 10-Bit Tags. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
4:3	RO	0x0	PCIE_CAP_PHANTOM_FUNC_SUPPORT Phantom Functions Supported. This field indicates the support for use of unclaimed function numbers to extend the number of outstanding transactions allowed by logically combining unclaimed function numbers (called Phantom Functions) with the Tag identifier (see Section 2.2.6.2 of PCI Express Base Specification for a description of Tag Extensions). With every Function in an ARI Device, the Phantom Functions Supported field must be set to 00b. The remainder of this field description applies only to non-ARI Multi-Function Devices. This field indicates the number of most significant bits of the Function Number portion of Requester ID that are logically combined with the Tag identifier. Note: Phantom Function support for the function must be enabled by the Phantom Functions Enable field in the Device Control register before the Function is permitted to use the Function Number field in the Requester ID for Phantom Functions. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
			Note: This register field is sticky.
2:0	RO	0x0	PCIE_CAP_MAX_PAYLOAD_SIZE Max_Payload_Size Supported. This field indicates the maximum payload size that the function can support for TLPs. All encodings other than the defined encodings are reserved. The functions of a Multi-Function Device are permitted to report different values for this field. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.

PCIE_DSP_PF0_PCIE_CAP_DEVICE_CONTROL_DEVICE_STATUS

Address: Operational Base(0x00000070) + offset (0x0008)

Bit	Attr	Reset Value	Description
31:22	RO	0x000	RSVDP_22 Reserved for future use.
21	RO	0x0	PCIE_CAP_TRANS_PENDING Transactions Pending. Root and Switch Ports: The controller hardwires this bit to 0b.
20	RO	0x1	PCIE_CAP_AUX_POWER_DETECTED AUX Power Detected. Functions that require Aux power report this bit as set if Aux power is detected by the function. This bit is derived by sampling the sys_aux_pwr_det input.
19	RW	0x0	PCIE_CAP_UNSUPPORTED_REQ_DETECTED Unsupported Request Detected. This bit indicates that the function received an Unsupported Request. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. For a Multi-Function Device, each function indicates status of errors as perceived by the respective function.
18	RW	0x0	PCIE_CAP_FATAL_ERR_DETECTED Fatal Error Detected. This bit indicates status of Fatal errors detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. For a Multi-Function device, each function indicates status of errors as perceived by the respective Function. For Functions supporting Advanced Error Handling, errors are logged in this register regardless of the settings of the Uncorrectable Error Mask register.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
17	RW	0x0	PCIE_CAP_NON_FATAL_ERR_DETECTED Non-Fatal Error Detected. This bit indicates status of Non-fatal errors detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. For a Multi-Function device, each function indicates status of errors as perceived by the respective Function. For functions supporting Advanced Error Handling, errors are logged in this register regardless of the settings of the Uncorrectable Error Mask register.
16	RW	0x0	PCIE_CAP_CORR_ERR_DETECTED Correctable Error Detected. This bit indicates status of correctable errors detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. For a Multi-Function device, each function indicates status of errors as perceived by the respective function. For functions supporting Advanced Error Handling, errors are logged in this register regardless of the settings of the Correctable Error Mask register.
15	RO	0x0	reserved
14:12	RW	0x2	PCIE_CAP_MAX_READ_REQ_SIZE Max_Read_Request_Size. This field sets the maximum Read Request size for the function as a Requester. The function must not generate Read Requests with a size exceeding the set value. For functions that do not generate Read Requests larger than 128 bytes and functions that do not generate Read Requests on their own behalf, the controller implements this field as Read Only (RO) with a value of 000b.
11	RO	0x0	PCIE_CAP_EN_NO_SNOOP Enable No Snoop. If this bit is set, the function is permitted to Set the No Snoop bit in the Requester Attributes of transactions it initiates that do not require hardware enforced cache coherency (see section 2.2.6.5 in PCI Express Base Specification). Note: Setting this bit to 1b should not cause a function to set the No Snoop attribute on all transactions that it initiates. Even when this bit is set, a function is only permitted to set the No Snoop attribute on a transaction when it can guarantee that the address of the transaction is not stored in any cache in the system. The controller hardwires this bit 0b if a function would never set the No Snoop attribute in transactions it initiates. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
10	RW	0x0	PCIE_CAP_AUX_POWER_PM_EN Aux Power PM Enable. This bit is derived by sampling the sys_aux_pwr_det input. When set this bit, enables a function to draw Aux power independent of PME Aux power. Functions that require Aux power on legacy operating systems should continue to indicate PME Aux power requirements. Aux power is allocated as requested in the Aux_Current field of the Power Management Capabilities register (PMC), independent of the PME_En bit in the Power Management Control/Status register (PMCSR). For Multi-Function devices, a component is allowed to draw Aux power if at least one of the functions has this bit set. Note: Functions that consume Aux power must preserve the value of this sticky register when Aux power is available. In such functions, this bit is not modified by Conventional Reset. For functions that do not implement this capability, the controller hardwires this bit to 0b. Note: This register field is sticky.
9	RO	0x0	PCIE_CAP_PHANTOM_FUNC_EN Phantom Functions Enable. This bit, in combination with the 10-Bit Tag Requester Enable bit in the Device Control 2 register, determines how many Tag field bits a Requester is permitted to use. When the 10-Bit Tag Requester Enable bit is clear, - If this bit is set, it enables a function to use unclaimed functions as Phantom functions to extend the number of outstanding transaction identifiers - If this bit is clear, the function is not allowed to use Phantom functions For more details, see section 2.2.6.2 of PCI Express Base Specification. Software should not change the value of this bit while the function has outstanding Non-Posted Requests; otherwise, the result is undefined. For functions that do not implement this capability, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: DEVICE_CAPABILITIES_REG.PCIE_CAP_PHANTOM_FUNC_SUPPORT ? RW : RO

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
8	RO	0x0	PCIE_CAP_EXT_TAG_EN Extended Tag Field Enable. This bit, in combination with the 10-Bit Tag Requester Enable bit in the Device Control 2 register, determines how many Tag field bits a Requester is permitted to use. When the 10-Bit Tag Requester Enable bit is clear, - If the Extended Tag Field Enable bit is set, the function is permitted to use an 8-bit Tag field as a Requester - If the Extended Tag Field Enable bit is clear, the Function is restricted to a 5-bit Tag field See section 2.2.6.2 of PCI Express Base Specification for required behavior when the 10-Bit Tag Requester Enable bit is set. If software changes the value of the Extended Tag Field Enable bit while the function has outstanding Non-Posted Requests, the result is undefined. For functions that do not implement this capability, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: DEVICE_CAPABILITIES_REG.PCIE_CAP_EXT_TAG_SUPP ? RW : RO
7:5	RW	0x0	PCIE_CAP_MAX_PAYLOAD_SIZE_CS Max_Payload_Size. This field sets maximum TLP payload size for the Function. As a Receiver, the Function must handle TLPs as large as the set value. As a Transmitter, the Function must not generate TLPs exceeding the set value. Permissible values that can be programmed are indicated by the Max_Payload_Size Supported field (PCIE_CAP_MAX_PAYLOAD_SIZE) in the Device Capabilities (DEVICE_CAPABILITIES_REG) register (for more details, see section 7.5.3.3 of PCI Express Base Specification). This field sets the maximum Read Request size for the function as a Requester. The function must not generate Read Requests with a size exceeding the set value. For Functions that support only the 128-byte max payload size, the controller hardwires this field to 000b. System software is not required to program the same value for this field for all the Functions of a Multi-Function device (for more details, see section 2.2.2 of PCI Express Base Specification). For ARI Devices, Max_Payload_Size is determined solely by the setting in Function0. The settings in the other Functions always return whatever value software programmed for each, but otherwise are ignored by the component. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
4	RW	0x1	PCIE_CAP_EN_REL_ORDER Enable Relaxed Ordering. If this bit is set, the function is permitted to set the Relaxed Ordering bit in the Attributes field of transactions it initiates that do not require strong write ordering (for more details, see section 2.2.6.4 and section 2.4 of PCI Express Base Specification). For a function that never sets the Relaxed Ordering attribute in transactions it initiates as a Requester, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W
3	RW	0x0	PCIE_CAP_UNSUPPORT_REQ_REP_EN Unsupported Request Reporting Enable. This bit, in conjunction with other bits, controls the signaling of Unsupported Request Errors by sending error Messages (for more details, see section 6.2.5 and section 6.2.6 of PCI Express Base Specification). For a Multi-Function Device, this bit controls error reporting for each Function from point-of-view of the respective Function.
2	RW	0x0	PCIE_CAP_FATAL_ERR_REPORT_EN Fatal Error Reporting Enable. This bit, in conjunction with other bits, controls sending ERR_FATAL Messages (for more details, see section 6.2.5 and section 6.2.6 of of PCI Express Base Specification). For a Multi-Function device, this bit controls error reporting for each function from point-of-view of the respective function. For a Root Port, the reporting of Fatal errors is internal to the root. No external ERR_FATAL Message is generated.
1	RW	0x0	PCIE_CAP_NON_FATAL_ERR_REPORT_EN Non-Fatal Error Reporting Enable. This bit, in conjunction with other bits, controls sending ERR_NONFATAL Messages (for more details, see section 6.2.5 and Section 6.2.6 of PCI Express Base Specification). For a Multi-Function Device, this bit controls error reporting for each function from point-of-view of the respective Function. For a Root Port, the reporting of Non-fatal errors is internal to the root. No external ERR_NONFATAL Message is generated.
0	RW	0x0	PCIE_CAP_CORR_ERR_REPORT_EN Correctable Error Reporting Enable. This bit, in conjunction with other bits, controls sending ERR_COR Messages (for more details, see section 6.2.5, section 6.2.6, and section 6.2.10.2 of PCI Express Base Specification). For a Multi-Function device, this bit controls error reporting for each function from point-of-view of the respective function. For a Root Port, the reporting of correctable errors is internal to the root. No external ERR_COR Message is generated.

PCIE_DSP_PF0_PCIE_CAP_LINK_CAPABILITIES_REG

Address: Operational Base(0x00000070) + offset (0x000C)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:24	RO	0x00	PCIE_CAP_PORT_NUM Port Number. This field indicates the PCI Express Port number for the given PCI Express Link. Multi-Function Devices associated with an Upstream Port must report the same value in this field for all functions. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R
23	RO	0x0	RSVDP_23 Reserved for future use.
22	RO	0x1	PCIE_CAP_ASPM_OPT_COMPLIANCE ASPM Optionality Compliance. This field must be set to 1b in all functions. Components implemented against certain earlier versions of this specification will have this bit set to 0b. Software is permitted to use the value of this bit to help determine whether to enable ASPM or whether to run ASPM compliance tests. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R
21	RO	0x1	PCIE_CAP_LINK_BW_NOT_CAP Link Bandwidth Notification Capability. A value of 1b indicates support for the Link Bandwidth Notification status and interrupt mechanisms. This capability is required for all Root Ports and Switch Downstream Ports supporting Links wider than x1 and/or multiple Link speeds. This field is not applicable and is Reserved for Endpoints, PCI Express to PCI/PCI-X bridges, and Upstream Ports of Switches. For functions that do not implement the Link Bandwidth Notification Capability the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
20	RO	0x1	PCIE_CAP_DLL_ACTIVE_REP_CAP Data Link Layer Link Active Reporting Capable. For a Downstream Port, the controller hardwires this bit to 1b if the component supports the optional capability of reporting the DL_Active state of the Data Link Control and Management State Machine. For a hot-plug capable Downstream Port (as indicated by the Hot-Plug Capable bit of the Slot Capabilities register) or a Downstream Port that supports Link speeds greater than 5.0 GT/s, the controller hardwires this bit to 1b. For Upstream Ports and components that do not support this optional capability, the controller hardwires this bit to 0b.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
19	RO	0x0	PCIE_CAP_SURPRISE_DOWN_ERR_REP_CAP Surprise Down Error Reporting Capable. For a Downstream Port, this bit must be set if the component supports the optional capability of detecting and reporting a Surprise Down error condition. For Upstream Ports and components that do not support this optional capability, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
18	RO	0x0	PCIE_CAP_CLOCK_POWER_MAN Clock Power Management. For Upstream Ports, a value of 1b in this bit indicates that the component tolerates the removal of any reference clock(s) via the "clock request" (CLKREQ#) mechanism when the Link is in the L1 and L2/L3 Ready Link states. A value of 0b indicates the component does not have this capability and that reference clock(s) must not be removed in these Link states. L1 PM Substates defines other semantics for the CLKREQ# signal, which are managed independently of Clock Power Management. This Capability is applicable only in form factors that support "clock request" (CLKREQ#) capability. For a Multi-Function device associated with an Upstream Port, each Function indicates its capability independently. Power Management configuration software must only permit reference clock removal if all functions of the Multi-Function device indicate a 1b in this bit. For ARI Devices, all Functions must indicate the same value in this bit. For Downstream Ports, the controller hardwires this bit to 0b. Note: This register field is sticky.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
17:15	RO	0x5	PCIE_CAP_L1_EXIT_LATENCY L1 Exit Latency. This field indicates the L1 exit latency for the given PCI Express Link. The value reported indicates the length of time this Port requires to complete transition from ASPM L1 to L0. If ASPM L1 is not supported, the value is undefined. Note: Exit latencies may be influenced by PCI Express reference clock configuration depending upon whether a component uses a common or separate reference clock. Multi-Function Devices associated with an Upstream Port must report the same value in this field for all functions. There are two each of these register fields, this one and a shadow one at the same address. The Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG) determines which one is used by the controller and which one is accessed by a read request. Common Clock operation is supported (possible) in the controller when one or more of the following expressions is true: - CX_NFTS !=CX_COMM_NFTS - DEFAULT_L0S_EXIT_LATENCY !=DEFAULT_COMM_L0S_EXIT_LATENCY - DEFAULT_L1_EXIT_LATENCY !=DEFAULT_COMM_L1_EXIT_LATENCY Common Clock operation is enabled in the controller when you set the Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG). The assertion of CS2 (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) is required to write to the shadow field at this location. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
14:12	RO	0x2	PCIE_CAP_L0S_EXIT_LATENCY L0s Exit Latency. This field indicates the L0s exit latency for the given PCI Express Link. The value reported indicates the length of time this Port requires to complete transition from L0s to L0. If L0s is not supported, the value is undefined; however, see the Implementation Note "Potential Issues With Legacy Software When L0s is Not Supported" in section 5.4.1.1 of PCI Express Base Specification for the recommended value. Note: Exit latencies may be influenced by PCI Express reference clock configuration depending upon whether a component uses a common or separate reference clock. Multi-Function Devices associated with an Upstream Port must report the same value in this field for all functions. There are two each of these register fields, this one and a shadow one at the same address. The Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG) determines which one is used by the controller and which one is accessed by a read request. Common Clock operation is supported (possible) in the controller when one or more of the following expressions is true: - CX_NFTS !=CX_COMM_NFTS - DEFAULT_L0S_EXIT_LATENCY !=DEFAULT_COMM_L0S_EXIT_LATENCY - DEFAULT_L1_EXIT_LATENCY !=DEFAULT_COMM_L1_EXIT_LATENCY Common Clock operation is enabled in the controller when you set the Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG). The assertion of CS2 (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) is required to write to the shadow field at this location. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
11:10	RO	0x3	PCIE_CAP_ACTIVE_STATE_LINK_PM_SUPPORT Active State Power Management (ASPM) Support. This field indicates the level of ASPM supported on the given PCI Express Link. For more details on ASPM support requirements, see section 5.4.1 of PCI Express Base Specification. Multi-Function devices associated with an Upstream Port must report the same value in this field for all functions. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.

Bit	Attr	Reset Value	Description
9:4	RO	0x01	PCIE_CAP_MAX_LINK_WIDTH Maximum Link Width. This field indicates the maximum Link width (xN - corresponding to N Lanes) implemented by the component. This value is permitted to exceed the number of Lanes routed to the slot (Downstream Port), adapter connector (Upstream Port), or in the case of component-to-component connections, the actual wired connection width. All encodings other than the defined encodings are reserved. Multi-Function devices associated with an Upstream Port must report the same value in this field for all functions. In M-PCIe mode, the reset and dynamic values of this field are calculated by the controller. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
3:0	RO	0x3	PCIE_CAP_MAX_LINK_SPEED Max Link Speed. This field indicates the maximum Link speed of the associated Port. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the maximum Link speed. All encodings other than the defined encodings are reserved. Multi-Function Devices associated with an Upstream Port must report the same value in this field for all functions. In M-PCIe mode, the reset and dynamic values of this field are calculated by the controller. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.

PCIE_DSP_PF0_PCIE_CAP_LINK_CONTROL_LINK_STATUS_REG

Address: Operational Base(0x00000070) + offset (0x0010)

Bit	Attr	Reset Value	Description
31	RW	0x0	PCIE_CAP_LINK_AUTO_BW_STATUS Link Autonomous Bandwidth Status. This bit is set by hardware to indicate that hardware has autonomously changed Link speed or width, without the Port transitioning through DL_Down status, for reasons other than to attempt to correct unreliable Link operation. This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was indicated as an autonomous change. The write value is gated with the PCIE_CAP_LINK_BW_NOT_CAP field in LINK_CAPABILITIES_REG.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
			This bit is not applicable and is Reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. For functions that do not implement the Link Bandwidth Notification Capability, the controller hardwires this bit to 0b.
30	RW	0x0	PCIE_CAP_LINK_BW_MAN_STATUS Link Bandwidth Management Status. This bit is set by hardware to indicate that either of the following has occurred without the Port transitioning through DL_Down status: - A Link retraining has completed following a write of 1b to the Retrain Link bit. Note: This bit is set following any write of 1b to the Retrain Link bit, including when the Link is in the process of retraining for some other reason. - Hardware has changed Link speed or width to attempt to correct unreliable Link operation, either through an LTSSM timeout or a higher level process. This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was not indicated as an autonomous change. This bit is not applicable and is Reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. For functions that do not implement the Link Bandwidth Notification Capability, the controller hardwires this bit to 0b. The default value of this bit is 0b. The write value is gated with the PCIE_CAP_LINK_BW_NOT_CAP field in LINK_CAPABILITIES_REG.
29	RO	0x0	PCIE_CAP_DLL_ACTIVE Data Link Layer Link Active. This bit indicates the status of the Data Link Control and Management State Machine. It returns a 1b to indicate the DL_Active state, 0b otherwise. This bit must be implemented if the Data Link Layer Link Active Reporting Capable bit is 1b. Otherwise, the controller hardwires it to 0b.
28	RO	0x1	PCIE_CAP_SLOT_CLK_CONFIG Slot Clock Configuration. This bit indicates that the component uses the same physical reference clock that the platform provides on the connector. If the device uses an independent clock irrespective of the presence of a reference clock on the connector, this bit must be clear. For a Multi-Function Device, each Function must report the same value for this bit. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R

Bit	Attr	Reset Value	Description
27	RO	0x0	PCIE_CAP_LINK_TRAINING Link Training. This read-only bit indicates that the Physical Layer LTSSM is in the Configuration or Recovery state, or that 1b was written to the Retrain Link bit but Link training has not yet begun. Hardware clears this bit when the LTSSM exits the Configuration/Recovery state. This bit is not applicable and Reserved for Endpoints, PCI Express to PCI/PCI-X bridges, and Upstream Ports of Switches, and the controller hardwires it to 0b.
26	RO	0x0	RSVDP_26 Reserved for future use.
25:20	RO	0x01	PCIE_CAP_NEGO_LINK_WIDTH Negotiated Link Width. This field indicates the negotiated width of the given PCI Express Link. All encodings other than the defined encodings are reserved. The value in this field is undefined when the Link is not up.
19:16	RO	0x1	PCIE_CAP_LINK_SPEED Current Link Speed. This field indicates the negotiated Link speed of the given PCI Express Link. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. All encodings other than the defined encodings are reserved. The value in this field is undefined when the Link is not up.
15:14	RW	0x0	PCIE_CAP_DRS_SIGNALING_CONTROL DRS Signaling Control. Indicates the mechanism used to report reception of a DRS message. Must be implemented for Downstream Ports with the DRS Supported bit Set in the Link Capabilities 2 Register. Encodings are: If DRS Supported is set, receiving a DRS Message will set DRS Message Received in the Link Status 2 Register but will otherwise have no effect If the DRS Message Received bit in the Link Status 2 Register transitions from 0 to 1, and either MSI or MSI-X is enabled, an MSI or MSI-X interrupt is generated using the vector in Interrupt Message Number (section 7.5.3.2) If the DRS Message Received bit in the Link Status 2 Register transitions from 0 to 1, the Port must send an FRS Message Upstream with the FRS Reason field set to DRS Message Received. Behavior is undefined if this field is set to 10b and the FRS Supported bit in the Device Capabilities 2 Register is Clear. Behavior is undefined if this field is set to 11b. For Downstream Ports with the DRS Supported bit clear in the Link Capabilities 2 register, the controller hardwires this field to 00b. This field is Reserved for Upstream Ports. Note: The access attributes of this field are as follows:

Bit	Attr	Reset Value	Description
9	RW	0x0	PCIE_CAP_HW_AUTO_WIDTH_DISABLE Hardware Autonomous Width Disable. When set, this bit disables hardware from changing the Link width for reasons other than attempting to correct unreliable Link operation by reducing Link width. For a Multi-Function Device associated with an Upstream Port, the bit in Function 0 is of type RW, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this bit is of type RsvdP. For components that do not implement the ability autonomously to change Link width, the ciontroller hardwires this bit to 0b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W
8	RW	0x0	PCIE_CAP_EN_CLK_POWER_MAN Enable Clock Power Management. Applicable only for Upstream Ports and with form factors that support a "Clock Request" (CLKREQ#) mechanism, this bit operates as follows: For a non-ARI Multi-Function Device, power-management-configuration software must only Set this bit if all Functions of the Multi-Function Device indicate a 1b in the Clock Power Management bit of the Link Capabilities register. The component is permitted to use the CLKREQ# signal to power manage Link clock only if this bit is Set for all Functions. For ARI Devices, Clock Power Management is enabled solely by the setting in Function 0. The settings in the other Functions always return whatever value software programmed for each, but otherwise are ignored by the component. The CLKREQ# signal may also be controlled via the L1 PM Substates mechanism. Such control is not affected by the setting of this bit. For Downstream Ports and components that do not support Clock Power Management (as indicated by a 0b value in the Clock Power Management bit of the Link Capabilities register), the controller hardwires this bit to 0b. The write value is gated with the PCIE_CAP_CLOCK_POWER_MAN field in LINK_CAPABILITIES_REG. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: LINK_CAPABILITIES_REG.PCIE_CAP_CLOCK_POWER_MAN ? RWS : ROS Note: This register field is sticky.

Bit	Attr	Reset Value	Description
7	RW	0x0	PCIE_CAP_EXTENDED_SYNCH Extended Synch. When set, this bit forces the transmission of additional Ordered Sets when exiting the L0s state (see section 4.2.4.5 of PCI Express Base Specification) and when in the Recovery state (see section 4.2.6.4.1 of PCI Express Base Specification). This mode provides external devices (for example, logic analyzers) monitoring the Link time to achieve bit and Symbol lock before the Link enters the L0 state and resumes communication. For Multi-Function devices if any function has this bit set, then the component must transmit the additional Ordered Sets when exiting L0s or when in Recovery.
6	RW	0x0	PCIE_CAP_COMMON_CLK_CONFIG Common Clock Configuration. When set, this bit indicates that this component and the component at the opposite end of this Link are operating with a distributed common reference clock. A value of 0b indicates that this component and the component at the opposite end of this Link are operating with asynchronous reference clock. For non-ARI Multi-Function Devices, software must program the same value for this bit in all Functions. If not all Functions are Set, then the component must as a whole assume that its reference clock is not common with the Upstream component. For ARI Devices, Common Clock Configuration is determined solely by the setting in Function 0. The settings in the other Functions always return whatever value software programmed for each, but otherwise are ignored by the component. Components utilize this common clock configuration information to report the correct L0s and L1 Exit Latencies. After changing the value in this bit in both components on a Link, software must trigger the Link to retrain by writing a 1b to the Retrain Link bit of the Downstream Port.
5	RW	0x0	PCIE_CAP_RETRAIN_LINK Retrain Link. A write of 1b to this bit initiates Link retraining by directing the Physical Layer LTSSM to the Recovery state. If the LTSSM is already in Recovery or Configuration, re-entering Recovery is permitted but not required. If the Port is in DPC when a write of 1b to this bit occurs, the result is undefined. Reads of this bit always return 0b. It is permitted to write 1b to this bit while simultaneously writing modified values to other fields in this register. If the LTSSM is not already in Recovery or Configuration, the resulting Link training must use the modified values. If the LTSSM is already in Recovery or Configuration, the modified values are not required to affect the Link training that's already in progress. This bit is not applicable and is Reserved for Endpoints, PCI

Bit	Attr	Reset Value	Description
1:0	RW	0x0	PCIE_CAP_ACTIVE_STATE_LINK_PM_CONTROL Active State Power Management (ASPM) Control. This field controls the level of ASPM enabled on the given PCI Express Link. See section 5.4.1.3 of PCI Express Base Specification for requirements on when and how to enable ASPM. Note: "L0s Entry Enabled" enables the Transmitter to enter L0s. If L0s is supported, the Receiver must be capable of entering L0s even when the Transmitter is disabled from entering L0s (00b or 10b). ASPM L1 must be enabled by software in the Upstream component on a Link prior to enabling ASPM L1 in the Downstream component on that Link. When disabling ASPM L1, software must disable ASPM L1 in the Downstream component on a Link prior to disabling ASPM L1 in the Upstream component on that Link. ASPM L1 must only be enabled on the Downstream component if both components on a Link support ASPM L1. For Multi-Function Devices (including ARI Devices), it is recommended that software program the same value for this field in all Functions. For non-ARI Multi-Function Devices, only capabilities enabled in all Functions are enabled for the component as a whole. For ARI Devices, ASPM Control is determined solely by the setting in Function0, regardless of Function 0's D-state. The settings in the other Functions always return whatever value software programmed for each, but otherwise are ignored by the component. Software must not enable L0s in either direction on a given Link unless components on both sides of the Link each support L0s; otherwise, the result is undefined.

PCIE_DSP_PF0_PCIE_CAP_SLOT_CONTROL_SLOT_STATUS

Address: Operational Base(0x00000070) + offset (0x0018)

Bit	Attr	Reset Value	Description
31:25	RO	0x00	RSVDP_25 Reserved for future use.
24	RW	0x0	PCIE_CAP_DLL_STATE_CHANGED Data Link Layer State Changed. This bit is set when the value reported in the Data Link Layer Link Active bit of the Link Status register is changed. In response to a Data Link Layer State Changed event, software must read the Data Link Layer Link Active bit of the Link Status register to determine if the Link is active before initiating configuration cycles to the hot plugged device.
23	RO	0x0	PCIE_CAP_ELECTROMECH_INTERLOCK_STATUS Electromechanical Interlock Status. If an Electromechanical Interlock is implemented, this bit indicates the status of the Electromechanical Interlock.
22	RO	0x1	PCIE_CAP_PRESENCE_DETECT_STATE Presence Detect State. This bit indicates the presence of an adapter in the slot, reflected by the logical "OR" of the Physical Layer in-band presence detect mechanism and, if present, any out-of-band presence detect mechanism defined for the slot's corresponding form factor. Note that the in-band presence detect mechanism requires that power be applied to an adapter for its presence to be detected. Consequently, form factors that require a power controller for hot-plug must implement a physical pin presence detect mechanism. This bit must be implemented on all Downstream Ports that implement slots. For Downstream Ports not connected to slots (where the Slot Implemented bit of the PCI Express Capabilities register is 0b), the controller hardwires this bit to 1b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R
21	RO	0x0	PCIE_CAP_MRL_SENSOR_STATE MRL Sensor State. This bit reports the status of the MRL sensor if implemented. Encodings are define as above.
20	RW	0x0	PCIE_CAP_CMD_CPLD Command Completed. If Command Completed notification is supported (if the No Command Completed Support bit in the Slot Capabilities register is 0b), this bit is set when a hot-plug command has completed and the Hot-Plug Controller is ready to accept a subsequent command. The Command Completed status bit is set as an indication to host software that the Hot-Plug Controller has processed the previous command and is ready to receive the next command; it provides no guarantee that the action corresponding to the command is complete. If Command Completed notification is not supported, the controller hardwires this bit to 0b.

When set, this bit enables software notification on a MRL sensor changed event (for more details, see Section 6.7.3 of PCI Express Base Specification). If the MRL Sensor Present bit in the Slot Capabilities register is Clear, this bit is permitted to be read-only with a value of 0b.
1	RW	0x0	PCIE_CAP_POWER_FAULT_DETECTED_EN Power Fault Detected Enable. When set, this bit enables software notification on a power fault event (for more details, see Section 6.7.3 of PCI Express Base Specification). If a Power Controller that supports power fault detection is not implemented, this bit is permitted to be read-only with a value of 0b.
0	RW	0x0	PCIE_CAP_ATTENTION_BUTTON_PRESSED_EN Attention Button Pressed Enable. When set to 1b, this bit enables software notification on an attention button pressed event (for more details, see Section 6.7.3 of PCI Express Base Specification). If the Attention Button Present bit in the Slot Capabilities register is 0b, this bit is permitted to be read-only with a value of 0b.

PCIE_DSP_PF0_PCIE_CAP_ROOT_CONTROL_ROOT_CAPABILITIES_REG

Address: Operational Base(0x00000070) + offset (0x001C)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	RSVDP_17 Reserved for future use.
16	RO	0x1	PCIE_CAP_CRS_SW_VISIBILITY CRS Software Visibility Capable. When set, this bit indicates that the Root Port is capable of returning Configuration Request Retry Status (CRS) Completion Status to software (for more details, see section 2.3.1 of PCI Express Base Specification). Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W (Sticky) else R (Sticky) Note: This register field is sticky.
15:5	RO	0x000	RSVDP_5 Reserved for future use.
4	RW	0x0	PCIE_CAP_CRS_SW_VISIBILITY_EN CRS Software Visibility Enable. When set, this bit enables the Root Port to return Configuration Request Retry Status (CRS) Completion Status to software (for more details, see section 2.3.1 of PCI Express Base Specification). For Root Ports that do not implement this capability, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: ROOT_CONTROL_ROOT_CAPABILITIES_REG.PCIE_CAP_CRS_SW_VISIBILITY ? RW : RO

Bit	Attr	Reset Value	Description
3	RW	0x0	PCIE_CAP_PME_INT_EN PME Interrupt Enable. When set, this bit enables PME interrupt generation upon receipt of a PME Message as reflected in the PME Status bit (for more details, see Table 7-29 of PCI Express Base Specification). A PME interrupt is also generated if the PME Status bit is set when this bit is changed from clear to set.
2	RW	0x0	PCIE_CAP_SYS_ERR_ON_FATAL_ERR_EN System Error on Fatal Error Enable. If set, this bit indicates that a System Error should be generated if a Fatal error (ERR_FATAL) is reported by any of the devices in the Hierarchy Domain associated with this Root Port, or by the Root Port itself. The mechanism for signaling a System Error to the system is system specific.
1	RW	0x0	PCIE_CAP_SYS_ERR_ON_NON_FATAL_ERR_EN System Error on Non-Fatal Error Enable. If set, this bit indicates that a System Error should be generated if a Non-fatal error (ERR_NONFATAL) is reported by any of the devices in the Hierarchy Domain associated with this Root Port, or by the Root Port itself. The mechanism for signaling a System Error to the system is system specific.
0	RW	0x0	PCIE_CAP_SYS_ERR_ON_CORR_ERR_EN System Error on Correctable Error Enable. If set, this bit indicates that a System Error should be generated if a correctable error (ERR_COR) is reported by any of the devices in the Hierarchy Domain associated with this Root Port, or by the Root Port itself. The mechanism for signaling a System Error to the system is system specific.

PCIE_DSP_PF0_PCIE_CAP_ROOT_STATUS_REG

Address: Operational Base(0x00000070) + offset (0x0020)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	RSVDP_18 Reserved for future use.
17	RO	0x0	PCIE_CAP_PME_PENDING PME Pending. This bit indicates that another PME is pending when the PME Status bit is s et. When the PME Status bit is cleared by software; the PME is delivered by hardware by setting the PME Status bit again and updating the PME Requester ID field appropriately. The PME Pending bit is cleared by hardware if no more PMEs are pending.
16	RW	0x0	PCIE_CAP_PME_STATUS PME Status. This bit indicates that PME was asserted by the PME Requester indicated in the PME Requester ID field. Subsequent PMEs are kept pending until the status register is cleared by software by writing a 1b.
15:0	RO	0x0000	PCIE_CAP_PME_REQ_ID PME Requester ID. This field indicates the PCI Requester ID of the last PME Requester. This field is only valid when the PME Status bit is set.

23:20	RO	0x0	reserved
19:18	RO	0x3	PCIE_CAP_OBFF_SUPPORT OBFF Supported. This field indicates if OBFF is supported and, if so, what signaling mechanism is used. The value reported in this field must indicate support for WAKE# signaling only if: - for a Downstream Port, driving the WAKE# signal for OBFF is supported and the connector or component connected Downstream is known to receive that same WAKE# signal - for an Upstream Port, receiving the WAKE# signal for OBFF is supported and, if the component is on an add-in-card, that the component is connected to the WAKE# signal on theconnector. Root Ports, Switch Ports, and Endpoints are permitted to implement this capability. For a Multi-Function Device associated with an Upstream Port, each Function must report the same value for this field. For Bridges and Ports that do not implement this capability, the controller hardwires this field to 00b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W(Sticky) else R(Sticky) Note: This register field is sticky.
17	RO	0x0	PCIE_CAP2_10_BIT_TAG_REQ_SUPPORT 10-Bit Tag Requester Supported. If this bit is set, the Function supports 10-Bit Tag Requester capability; otherwise, the Function does not. This bit must not be set if the 10-Bit Tag Completer Supported bit is clear. Note: 10-Bit Tag field generation must be enabled by the 10-Bit Tag Requester Enable bit in the Device Control 2 register of the Requester Function before 10-Bit Tags can be generated by the Requester. For more details, see section 2.2.6.2. of PCI Express Base Specification.
16	RO	0x0	PCIE_CAP2_10_BIT_TAG_COMP_SUPPORT 10-Bit Tag Completer Supported. If this bit is set, the Function supports 10-Bit Tag Completer capability; otherwise, the Function does not. For more details, see section 2.2.6.2. of PCI Express Base Specification.
15:14	RO	0x0	reserved
13	RO	0x0	PCIE_CAP_TPH_CMPLT_SUPPORT_1 TPH Completer Supported Bit 1.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
12	RO	0x0	PCIE_CAP_TPH_CMPLT_SUPPORT_0 TPH Completer Supported Bit 0. Value of this bit along with TPH Completer Supported Bit 1 indicates Completer support for TPH or Extended TPH. Applicable only to Root Ports and Endpoints. For all other Functions, this field is Reserved. For more details, see section 6.17 of PCI Express Base Specification.
11	RO	0x1	PCIE_CAP_LTR_SUPP LTR Mechanism Supported. A value of 1b indicates support for the optional Latency Tolerance Reporting (LTR) mechanism. Root Ports, Switches and Endpoints are permitted to implement this capability. For a Multi-Function Device associated with an Upstream Port, each Function must report the same value for this bit. For Bridges and other Functions that do not implement this capability, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W(Sticky) else R(Sticky) Note: This register field is sticky.
10	RO	0x1	PCIE_CAP_NO_RO_EN_PR2PR_PAR No RO-enabled PR-PR Passing. If this bit is set, the routing element never carries out the passing permitted by Table 2-39 of PCI Express Base Specification entry A2b that is associated with the Relaxed Ordering Attribute field being Set. This bit applies only for Switches and RCs that support peer-to-peer traffic between Root Ports. This bit applies only to Posted Requests being forwarded through the Switch or RC and does not apply to traffic originating or terminating within the Switch or RC itself. All Ports on a Switch or RC must report the same value for this bit. For all other functions, this bit must be 0b.
9	RO	0x0	PCIE_CAP_128_CAS_CPL_SUPP 128-bit CAS Completer Supported. Applicable to Functions with Memory Space BARs as well as all Root Ports; must be 0b otherwise. This bit must be set to 1b if the Function supports this optional capability. For more details, see section 6.15 of PCI Express Base Specification.
8	RO	0x0	PCIE_CAP_64_ATOMIC_CPL_SUPP 64-bit AtomicOp Completer Supported. Applicable to Functions with Memory Space BARs as well as all Root Ports; must be 0b otherwise. Includes FetchAdd, Swap, and CAS AtomicOps. This bit must be set to 1b if the Function supports this optional capability. For more details on additional RC requirements, see section 6.15.3.1 of PCI Express Base Specification.
7	RO	0x0	PCIE_CAP_32_ATOMIC_CPL_SUPP 32-bit AtomicOp Completer Supported. Applicable to Functions with Memory Space BARs as well as all Root Ports; must be 0b otherwise. Includes FetchAdd, Swap, and CAS AtomicOps. This bit must be set to 1b if the Function supports this optional capability. For more details on additional RC requirements, see section 6.15.3.1 of PCI Express Base Specification.

Bit	Attr	Reset Value	Description
6	RO	0x0	PCIE_CAP_ATOMIC_ROUTING_SUPP AtomicOp Routing Supported. Applicable only to Switch Upstream Ports, Switch Downstream Ports, and Root Ports; must be 0b for other Function types. This bit must be set to 1b if the Port supports this optional capability. For more details, see section 6.15 of PCI Express Base Specification.
5	RO	0x0	PCIE_CAP_ARI_FORWARD_SUPPORT ARI Forwarding Supported. Applicable only to Switch Downstream Ports and Root Ports; must be 0b for other Function types. This bit must be set to 1b if a Switch Downstream Port or Root Port supports this optional capability. For more details, see section 6.13 of PCI Express Base Specification.
4	RO	0x1	PCIE_CAP_CPL_TIMEOUT_DISABLE_SUPPORT Completion Timeout Disable Supported. A value of 1b indicates support for the Completion Timeout Disable mechanism. The Completion Timeout Disable mechanism is required for Endpoints that issue Requests on their own behalf and PCI Express to PCI/PCI-X Bridges that take ownership of Requests issued on PCI Express. This mechanism is optional for Root Ports. For all other Functions this field is Reserved and the controller hardwires this bit to 0b.
3:0	RO	0x0	PCIE_CAP_CPL_TIMEOUT_RANGE Completion Timeout Ranges Supported. This field indicates device Function support for the optional Completion Timeout programmability mechanism. This mechanism allows system software to modify the Completion Timeout value. This field is applicable only to Root Ports, Endpoints that issue Requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of Requests issued on PCI Express. For all other Functions this field is Reserved and must be hardwired to 0000b. Four time value ranges are defined: - Range A: 50 us to 10 ms - Range B: 10 ms to 250 ms - Range C: 250 ms to 4 s - Range D: 4 s to 64 s Bits are set according to the list below to show timeout value ranges supported. All encodings other than the defined encodings are reserved. It is strongly recommended that the Completion Timeout mechanism not expire in less than 10 ms.

System firmware and software is allowed to modify this field only during debug or compliance testing. In all other cases, the system must ensure that this field is set to the default value. Note: This register field is sticky.
6	RO	0x0	PCIE_CAP_SEL_DEEMPHASIS Selectable De-emphasis. When the Link is operating at 5.0 GT/s speed, this bit is used to control the transmit de-emphasis of the link in specific situations. For more details, see section 4.2.6 of PCI Express Base Specification. When the Link is not operating at 5.0 GT/s speed, the setting of this bit has no effect. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 0b. This bit is not applicable and Reserved for Endpoints, PCI Express to PCI/PCI-X bridges, and Upstream Ports of Switches. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.
5	RW	0x0	PCIE_CAP_HW_AUTO_SPEED_DISABLE Hardware Autonomous Speed Disable. When set, this bit disables hardware from changing the Link speed for device-specific reasons other than attempting to correct unreliable Link operation by reducing Link speed. Initial transition to the highest supported common link speed is not blocked by this bit. For a Multi-Function Device associated with an Upstream Port, the bit in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this bit is of type RsvdP. Functions that do not implement the associated mechanism are permitted to hardwire this bit to 0b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W (sticky) Note: This register field is sticky.

Bit	Attr	Reset Value	Description
4	RW	0x0	PCIE_CAP_ENTER_COMPLIANCE Enter Compliance. Software is permitted to force a Link to enter Compliance mode (at the speed indicated in the Target Link Speed field and the de-emphasis/preset level indicated by the Compliance Preset/De-emphasis field) by setting this bit to 1b in both components on a Link and then initiating a hot reset on the Link. Default value of this bit following Fundamental Reset is 0b. For a Multi-Function Device associated with an Upstream Port, the bit in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this bit is of type RsvdP. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 0b. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W (sticky) Note: This register field is sticky.

Bit	Attr	Reset Value	Description
			PCIE_CAP_TARGET_LINK_SPEED Target Link Speed. For Downstream Ports, this field sets an upper limit on Link operational speed by restricting the values advertised by the Upstream component in its training sequences. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the desired target Link speed. All encodings other than the defined encodings are reserved. If a value is written to this field that does not correspond to a supported speed (as indicated by the Supported Link Speeds Vector), the result is undefined. If either of the Enter Compliance or Enter Modified Compliance bits are implemented, then this field must also be implemented. The default value of this field is the highest Link speed supported by the component (as reported in the Max Link Speed field of the Link Capabilities register) unless the corresponding platform/form factor requires a different default value.
3:0	RW	0x3	For both Upstream and Downstream Ports, this field is used to set the target compliance mode speed when software is using the Enter Compliance bit to force a Link into compliance mode. For Upstream Ports, if the Enter Compliance bit is Clear, this field is permitted to have no effect. For a Multi-Function Device associated with an Upstream Port, the field in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this field is of type RsvdP. Components that support only the 2.5 GT/s speed are permitted to hardwire this field to 0000b. In M-PCIe mode, the contents of this field are derived from other registers. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W (sticky) Note: This register field is sticky.

14.4.3.6 PCIE_DSP_PF0_AER_CAP Register Description

14.4.3.6.1 Registers Summary

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_AER_CAP_AER_EXT_CAP_HDR_OFF	0x0000	W	0x14820001	Advanced Error Reporting Extended Capability Header provides information about Capability ID, Version, and next offset.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_AER_CAP_UNCORR_ERR_STATUS_OFF	0x0004	W	0x00000000	The Uncorrectable Error Status Register (Offset 04h) indicates error detection status of individual errors on a PCI Express device Function.An individual error status bit that is Set indicates that a particular error was detected; software may clear an error status by writing a 1b to the respective bit.Register bits not implemented by the Function are hardwired to 0b.
PCIE_DSP_PF0_AER_CAP_UNCORR_ERR_MASK_OFF	0x0008	W	0x00400000	The Uncorrectable Error Mask Register controls reporting of individual errors by the device Function to the PCI Express Root Complex through a PCI Express error Message.A masked error (respective bit Set in the mask register) is not recorded or reported in the Header Log, TLP Prefix Log, or First Error Pointer, and is not reported to the PCI Express Root Complex by this Function.There is a mask bit per error bit of the Uncorrectable Error Status register. Register fields for bits not implemented by the Function are hardwired to 0b.
PCIE_DSP_PF0_AER_CAP_UNCORR_ERR_SEV_OFF	0x000C	W	0x00462030	The Uncorrectable Error Severity Register controls whether an individual error is reported as a Non-fatal or Fatal error.An error is reported as fatal when the corresponding error bit in the severity register is Set. If the bit is Clear, the corresponding error is considered non-fatal.
PCIE_DSP_PF0_AER_CAP_CORR_ERR_STATUS_OFF	0x0010	W	0x00000000	The Correctable Error Status register reports error status of individual correctable error sources on a PCI Express device Function.When an individual error status bit is Set, it indicates that a particular error occurred; software may clear an error status by writing a 1b to the respective bit.Register bits not implemented by the Function are hardwired to 0b by the controller.

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_AER_CAP_CORR_ERR_MASK_OFF	0x0014	W	0x0000E000	The Correctable Error Mask Register controls reporting of individual correctable errors by this Function to the PCI Express Root Complex through a PCI Express error Message.A masked error (respective bit Set in the mask register) is not reported to the PCI Express Root Complex by this Function.There is a mask bit per error bit in the Correctable Error Status register. Register fields for bits not implemented by the Function are hardwired to 0b by the controller.
PCIE_DSP_PF0_AER_CAP_ADV_ERR_CAP_CTRL_OFF	0x0018	W	0x000000A0	Advanced Error Capabilities and Control Register provides information whether the individual capability is supported or not. If the capability is supported then it is enabled or not.
PCIE_DSP_PF0_AER_CAP_HDR_LOG_0_OFF	0x001C	W	0x00000000	The Header Log Register 0 contains the header for the TLP corresponding to a detected error; The header is captured such that, when read using DW accesses, the fields of the header are laid out in the same way the headers are presented in the specification.Therefore, byte 0 of the header is located in byte 3 of the Header Log Register 0, byte 1 of the header is in byte 2 of the Header Log Register 0, and so forth. For 12-byte headers, only bytes 0 through 11 of the Header Log Register are used and values in bytes 12 through 15 are undefined.In certain cases where a Malformed TLP is reported, the Header Log Register may contain TLP Prefix information.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_AER_CAP_HDR_LOG_1_OFF	0x0020	W	0x00000000	The Header Log Register 1 contains the header for the TLP corresponding to a detected error; The header is captured such that, when read using DW accesses, the fields of the header are laid out in the same way the headers are presented in the specification.Therefore, byte 0 of the header is located in byte 3 of the Header Log Register 1, byte 1 of the header is in byte 2 of the Header Log Register 1 and so forth. For 12-byte headers, only bytes 0 through 11 of the Header Log Register are used and values in bytes 12 through 15 are undefined.In certain cases where a Malformed TLP is reported, the Header Log Register may contain TLP Prefix information.
PCIE_DSP_PF0_AER_CAP_HDR_LOG_2_OFF	0x0024	W	0x00000000	The Header Log Register 2 contains the header for the TLP corresponding to a detected error; The header is captured such that, when read using DW accesses, the fields of the header are laid out in the same way the headers are presented in the specification.Therefore, byte 0 of the header is located in byte 3 of the Header Log Register 2, byte 1 of the header is in byte 2 of the Header Log Register 2 and so forth. For 12-byte headers, only bytes 0 through 11 of the Header Log Register are used and values in bytes 12 through 15 are undefined.In certain cases where a Malformed TLP is reported, the Header Log Register may contain TLP Prefix information.
PCIE_DSP_PF0_AER_CAP_HDR_LOG_3_OFF	0x0028	W	0x00000000	The Header Log Register 3 contains the header for the TLP corresponding to a detected error; The header is captured such that, when read using DW accesses, the fields of the header are laid out in the same way the headers are presented in the specification.Therefore, byte 0 of the header is located in byte 3 of the Header Log Register 3, byte 1 of the header is in byte 2 of the Header Log Register 3 and so

Name	Offset	Size	Reset Value	Description
				forth. For 12-byte headers, only bytes 0 through 11 of the Header Log Register are used and values in bytes 12 through 15 are undefined.In certain cases where a Malformed TLP is reported, the Header Log Register may contain TLP Prefix information.
PCIE_DSP_PF0_AER_CAP_ROOT_ERR_CMD_OFF	0x002C	W	0x00000000	The Root Error Command Register allows further control of Root Complex response to Correctable, Non-Fatal, and Fatal error Messages than the basic Root Complex capability to generatesystem errors in response to error Messages.
PCIE_DSP_PF0_AER_CAP_ROOT_ERR_STATUS_OFF	0x0030	W	0x48000000	The Root Error Status Register reports status of error Messages (ERR_COR, ERR_NONFATAL, and ERR_FATAL) received by the Root Port, and of errors detected by the Root Port itself(The Root Port had sent an error Message to itself).In order to update this register, error Messages received by the Root Port and/or internally generated error Messages must be enabled for i°transmissioni± by the primary interface of the Root Port.
PCIE_DSP_PF0_AER_CAP_ERR_SRC_ID_OFF	0x0034	W	0x00000000	The Error Source Identification Register identifies the source (Requester ID) of first correctable and uncorrectable (Non-fatal/Fatal) errors reported in the Root Error Status Register.This register is updated regardless of the settings of the Root Control register and the Root Error Command Register.

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_AER_CAP_TLP_PREFIX_LOG_1_OFF	0x0038	W	0x00000000	The First TLP Prefix Log Register contains the first End-End TLP Prefix from the TLP corresponding to the detected error. The TLP Prefix Log Register is only meaningful when the TLP Prefix Log Present bit is Set.The TLP Prefixes are captured such that, when read using DW accesses, the fields of the TLP Prefix are laid out in the same way the fields of the TLP Prefix are described.Therefore, byte 0 of a TLP Prefix is located in byte 3 of the associated TLP Prefix Log Register; byte 1 of a TLP Prefix is located in byte 2; and so forth. The TLP Prefix Log Registers beyond the number supported by the Function are hardwired to zero by controller.If the End-End TLP Prefix Supported bit is Clear, the TLP Prefix Log Register is not required to be implemented.
PCIE_DSP_PF0_AER_CAP_TLP_PREFIX_LOG_2_OFF	0x003C	W	0x00000000	The Second TLP Prefix Log Register contains the second End-End TLP Prefix from the TLP corresponding to the detected error. The TLP Prefix Log Register is only meaningful when the TLP Prefix Log Present bit is Set.The TLP Prefixes are captured such that, when read using DW accesses, the fields of the TLP Prefix are laid out in the same way the fields of the TLP Prefix are described.Therefore, byte 0 of a TLP Prefix is located in byte 3 of the associated TLP Prefix Log Register; byte 1 of a TLP Prefix is located in byte 2; and so forth. The TLP Prefix Log Registers beyond the number supported by the Function are hardwired to zero by controller.If the End-End TLP Prefix Supported bit is Clear, the TLP Prefix Log Register is not required to be implemented.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_AER_CAP_TLP_PREFIX_LOG_3_OFF	0x0040	W	0x00000000	The Third TLP Prefix Log Register contains the third End-End TLP Prefix from the TLP corresponding to the detected error. The TLP Prefix Log Register is only meaningful when the TLP Prefix Log Present bit is Set.The TLP Prefixes are captured such that, when read using DW accesses, the fields of the TLP Prefix are laid out in the same way the fields of the TLP Prefix are described.Therefore, byte 0 of a TLP Prefix is located in byte 3 of the associated TLP Prefix Log Register; byte 1 of a TLP Prefix is located in byte 2; and so forth. The TLP Prefix Log Registers beyond the number supported by the Function are hardwired to zero by controller.If the End-End TLP Prefix Supported bit is Clear, the TLP Prefix Log Register is not required to be implemented.
PCIE_DSP_PF0_AER_CAP_TLP_PREFIX_LOG_4_OFF	0x0044	W	0x00000000	The Fourth TLP Prefix Log Register contains the fourth End-End TLP Prefix from the TLP corresponding to the detected error. The TLP Prefix Log Register is only meaningful when the TLP Prefix Log Present bit is Set.The TLP Prefixes are captured such that, when read using DW accesses, the fields of the TLP Prefix are laid out in the same way the fields of the TLP Prefix are described.Therefore, byte 0 of a TLP Prefix is located in byte 3 of the associated TLP Prefix Log Register; byte 1 of a TLP Prefix is located in byte 2; and so forth. The TLP Prefix Log Registers beyond the number supported by the Function are hardwired to zero by controller.If the End-End TLP Prefix Supported bit is Clear, the TLP Prefix Log Register is not required to be implemented.

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

14.4.3.6.2 Detail Registers Description

PCIE_DSP_PF0_AER_CAP_AER_EXT_CAP_HDR_OFF

Address: Operational Base(0x00000100) + offset (0x0000)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:20	RO	0x148	NEXT_OFFSET Next Capability Offset. This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI-compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.
19:16	RO	0x2	CAP_VERSION Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. This field must be 2h if the End-End TLP Prefix Supported bit is set and must be 1h or 2h otherwise. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.
15:0	RO	0x0001	CAP_ID AER Extended Capability ID. This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. The Extended Capability ID for the Advanced Error Reporting Capability is 0001h. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.

Bit	Attr	Reset Value	Description
22	RW	0x0	INTERNAL_ERR_STATUS Uncorrectable Internal Error Status. This field gives status of the Uncorrectable Internal Error. The controller sets this bit when your application asserts app_err_bus[9]. It does not set this bit when it detects internal uncorrectable internal errors such as parity and ECC failures. You should use the outputs from these errors to drive the app_err_bus[9] input. For more details, see the "Data Integrity (Wire, Datapath, and RAM Protection)" section in the Databook. Note: This register field is sticky.
21	RO	0x0	reserved
20	RW	0x0	UNSUPPORTED_REQ_ERR_STATUS Unsupported Request Error Status. This field represents status of Unsupported Request Error. Note: This register field is sticky.
19	RW	0x0	ECRC_ERR_STATUS ECRC Error Status. This field represents status of ECRC Error. Note:If CX_ECRC_ENABLE=0 the register field always reads 0. Note: This register field is sticky.
18	RW	0x0	MALF_TLP_ERR_STATUS Malformed TLP Status. This field represents status of Malformed TLP. Note: This register field is sticky.
17	RW	0x0	REC_OVERFLOW_ERR_STATUS Receiver Overflow Status. Status bit for Receiver Overflow. Note: This register field is sticky.
16	RW	0x0	UNEXP_CMPLT_ERR_STATUS Unexpected Completion Status. Status bit for Unexpected Completion. Note: This register field is sticky.
15	RW	0x0	CMPLT_ABORT_ERR_STATUS Completer Abort Status. Status bit for Completer Abort. Note: This register field is sticky.
14	RW	0x0	CMPLT_TIMEOUT_ERR_STATUS Completion Timeout Status. Status for Completion Timeout. Note: This register field is sticky.

PCIE_DSP_PF0_AER_CAP_ROOT_ERR_STATUS_OFF

Address: Operational Base(0x00000100) + offset (0x0030)

Bit	Attr	Reset Value	Description
31:27	RO	0x09	ADV_ERR_INT_MSG_NUM Advanced Error Interrupt Message Number. This register indicates which MSI/MSI-X vector is used for the interrupt message generated in association with any of the status bits of this Capability. For MSI, the value in this register indicates the offset between the base Message Data and the interrupt message that is generated. For MSI-X, the value in this register indicates which MSI-X Table entry is used to generate the interrupt message. The entry must be one of the first 32 entries even if the Function implements more than 32 entries. For a given MSI-X implementation, the entry must remain constant. If MSI-X is enabled, the value in this register must indicate the vector for MSI-X. If MSI is enabled or neither is enabled, the value in this register must indicate the vector for MSI. If software enables both MSI and MSI-X at the same time, the value in this register is undefined. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.

14.4.3.9 PCIE_DSP_PF0_RAS_DES_CAP Register Description

14.4.3.9.1 Registers Summary

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_RAS_DES_CAP_RAS_DES_CAP_HEADER_REG	0x0000	W	0x0001000B	The Vendor-Specific Extended Capability (VSEC Capability) is an optional Extended Capability that is permitted to be implemented by any PCI Express Function or RCRB.This Register contains Capability Id, Capability Version and Next Offset value for Vendor-Specific Extended Capability.
PCIE_DSP_PF0_RAS_DES_CAP_VENDOR_SPECIFIC_HEADER_REG	0x0004	W	0x10040002	This Register field provides VSEC Length, VSEC ID and VSEC Rev(Version Number).Vendor-specific software must qualify the associated Vendor ID of the PCI Express Function or RCRB before attempting to interpret the values in the VSEC ID or VSEC Rev fields.
PCIE_DSP_PF0_RAS_DES_CAP_EVENT_COUNTER_CONTROL_REG	0x0008	W	0x00000000	This is a viewport control register. - Setting the EVENT_COUNTER_EVENT_SELECT and EVENT_COUNTER_LANE_SELECT fields in this register determine the Event Counter data returned by the EVENT_COUNTER_DATA_REG viewport register. - Setting the EVENT_COUNTER_ENABLE field in this register enables the Event Counter selected by the EVENT_COUNTER_EVENT_SELECT and EVENT_COUNTER_LANE_SELECT fields in this register. - Setting the EVENT_COUNTER_CLEAR field in this register clears the Event Counter selected by the EVENT_COUNTER_EVENT_SELECT and EVENT_COUNTER_LANE_SELECT fields in this register. - Reading the EVENT_COUNTER_STATUS field in this register returns the Enable status of the Event Counter selected by the EVENT_COUNTER_EVENT_SELECT and EVENT_COUNTER_LANE_SELECT fields in this register.

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_RAS_DES_CAP_EVENT_COUNTER_DATA_REG	0x000C	W	0x00000000	This viewport register returns the data selected by the following fields: - EVENT_COUNTER_EVENT_SELECT in EVENT_COUNTER_CONTROL_REG - EVENT_COUNTER_LANE_SELECT in EVENT_COUNTER_CONTROL_REG For more details, see the RAS DES section in the Core Operations chapter of the Databook.
PCIE_DSP_PF0_RAS_DES_CAP_TIME_BASED_ANALYSIS_CONTROL_REG	0x0010	W	0x00000100	Used for controlling the measurement of RX/TX data throughput and time spent in each low-power LTSSM state.For more details, see the RAS DES section in the Core Operations chapter of the Databook.
PCIE_DSP_PF0_RAS_DES_CAP_TIME_BASED_ANALYSIS_DATA_REG	0x0014	W	0x00000000	Contains the measurement results of RX/TX data throughput and time spent in each low-power LTSSM state.This viewport register returns the data selected by the TIME_BASED_REPORT_SELECT field in TIME_BASED_ANALYSIS_CONTROL_REG.For more details, see the RAS DES section in the Core Operations chapter of the Databook.
PCIE_DSP_PF0_RAS_DES_CAP_TIME_BASED_ANALYSIS_DATA_63_32_REG	0x0018	W	0x00000000	This viewport register returns the data selected by the TIME_BASED_REPORT_SELECT field in TIME_BASED_ANALYSIS_CONTROL_REG.For more details, see the "Reliability, Availability, and Serviceability (RAS)" section in the "Controller Operations" chapter of the Databook.

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_RAS_DES_CAP_EINJ_ENABLE_REG	0x0030	W	0x00000000	Each type of error insertion is enabled by the corresponding bit in this register. The specific injection controls for each type of error are defined in the following registers: - 0: CRC Error: EINJ0_CRC_REG - 1: Sequence Number Error: EINJ1_SEQNUM_REG - 2: DLLP Error: EINJ2_DLLP_REG - 3: Symbol DataK Mask Error or Sync Header Error: EINJ3_SYMBOL_REG - 4: FC Credit Update Error: EINJ4_FC_REG - 5: TLP Duplicate/Nullify Error: EINJ5_SP_TLP_REG - 6: Specific TLP Error: EINJ6_COMPARE_*_REG/EINJ6_CHANGE_*_REG/EINJ6_TLP_REGAfter the errors have been inserted by controller, it will clear each bit here.For more details, see the RAS DES section in the Core Operations chapter of the Databook.
PCIE_DSP_PF0_RAS_DES_CAP_EINJ0_CRC_REG	0x0034	W	0x00000000	Controls the insertion of errors into the CRC, and parity of ordered sets for the selected type of the packets as follows: - LCRC. Bad TLP will be detected at the receiver side; receiver responds with NAK DLLP; Data Link Retry starts. - 16-bit CRC of ACK/NAK DLLPs. Bad DLLP occurs at the receiver side; Replay NUM Rollover occurs. - 16-bit CRC of UpdateFC DLLPs. Error insertion continues for the specific time; LTSSM transitions to the Recovery state because of the UpdateFC timeout (if the timeout is implemented at the receiver of the UpdateFCs). - ECRC. If ECRC check is enabled, ECRC error is detected at the receiver side. - FCRC. Framing error will be detected, TLP is discarded, and the LTSSM transitions to Recovery state. - Parity of TSOS. Error insertion continues for the specific time; LTSSM Recovery/Configuration timeout will occur. - Parity of SKPOS. Lane error will be detected at the

Name	Offset	Size	Reset Value	Description
				receiver side.
PCIE_DSP_PF0_RAS_DES_CAP_EINJ1_SEQNUM_REG	0x0038	W	0x00000000	Controls the sequence number of the specific TLPs and ACK/NAK DLLPs.Data Link Protocol Error will be detected at the Rx side of ACK/NAL DLLPs when one of these conditions is true: - ((NEXT_TRANSMIT_SEQ -1) - AckNak_Seq_Num) mod 4096 > 2048 - (AckNak_Seq_Num - ACKD_SEQ) mod 4096 >= 2048TLP is treated as Duplicate TLP at the Rx side when all these conditions are true: - Sequence Number != NEXT_RCV_SEQ - (NEXT_RCV_SEQ - Sequence Number) mod 4096 <= 2048TLP is treated as Bad TLP at the Rx side when all these conditions are true: - Sequence Number != NEXT_RCV_SEQ and - (NEXT_RCV_SEQ - Sequence Number) mod 4096 > 2048
PCIE_DSP_PF0_RAS_DES_CAP_EINJ2_DLLP_REG	0x003C	W	0x00000000	Controls the transmission of DLLPs and inserts the following errors: - If "ACK/NAK DLLP's transmission block" is selected, replay timeout error will occur at the transmitter of the TLPs and then Data Link Retry will occur. - If "Update FC DLLP's transmission block" is selected, LTSSM will transition to the Recovery state because of the UpdateFC timeout (if the timeout is implemented at the receiver of the UpdateFCs). - If "Always Transmission for NAK DLLP" is selected, Data Link Retry will occur at the transmitter of the TLPs. Furthermore, Replay NUM Rollover will occur when the transmitter has been requested four times to send the TLP with the same sequence number.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_RAS_DES_CAP_EINJ3_SYMBOL_REG	0x0040	W	0x00000000	When 8b/10b encoding is used, this register controls error insertion into the special (K code) symbols. - If TS1/TS2/FTS/E-Idle/SKP is selected, it affects whole of the ordered set. It might cause timeout of the LTSSM. - If END/EDB/STP/SDP is selected, TLP/DLLP will be discarded at the receiver side.When 128b/130b encoding is used, this register controls error insertion into the sync-header.
PCIE_DSP_PF0_RAS_DES_CAP_EINJ4_FC_REG	0x0044	W	0x00000000	Controls error insertion into the credit value in the UpdateFCs. It is possible to insert errors for any of the following types: - Posted TLP Header credit - Non-Posted TLP Header credit - Completion TLP Header credit - Posted TLP Data credit - Non-Posted TLP Data credit - Completion TLP Data creditThese errors are not correctable while error insertion is enabled. Receiver buffer overflow error might occur.
PCIE_DSP_PF0_RAS_DES_CAP_EINJ5_SP_TLP_REG	0x0048	W	0x00000000	Controls the generation of specified TLPs. Correctable errors will occur which will be fixed by the PCIe protocol. - For Duplicate TLP, the controller initiates Data Link Retry by handling ACK DLLP as NAK DLLP. These TLPs will be duplicate TLPs at the receiver side. - For Nullified TLP, the TLPs that the controller transmits are changed into nullified TLPs and the original TLPs are stored in the retry buffer. The receiver of these TLPs will detect the lack of seq# and send NAK DLLP at the next TLP. Then the original TLPs are sent from retry buffer and the data controls are recovered. For 128 bit controller or more than 128 bit, the controller inserts errors the number of times of EINJ5_COUNT but doesn't ensure that the errors are continuously inserted into TLPs.

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_RAS_DES_CAP_SD_EQ_STATUS1_REG	0x00E0	W	0x00000000	This viewport register returns the first of three words of Silicon Debug EQ Status data for the rate and lane selected by the EQ_RATE_SEL and EQ_LANE_SEL fields in the SD_EQ_CONTROL1_REG register.The following fields are available when Equalization finished unsuccessfully(EQ_CONVERGENCE_INFO=2). - EQ_RULEA_VIOLATION - EQ_RULEB_VIOLATION - EQ_RULEC_VIOLATION - EQ_REJECT_EVENTFor more details, see the RAS DES section in the Core Operations chapter of the Databook.
PCIE_DSP_PF0_RAS_DES_CAP_SD_EQ_STATUS2_REG	0x00E4	W	0x00000000	This viewport register returns the second of three words of Silicon Debug EQ Status data for the rate and lane selected by the EQ_RATE_SEL and EQ_LANE_SEL fields in the SD_EQ_CONTROL1_REG register.Each field is available when Equalization finished successfully(EQ_CONVERGENCE_INFO=1).For more details, see the RAS DES section in the Core Operations chapter of the Databook.
PCIE_DSP_PF0_RAS_DES_CAP_SD_EQ_STATUS3_REG	0x00E8	W	0x00000000	This viewport register returns the third of three words of Silicon Debug EQ Status data for the rate and lane selected by the EQ_RATE_SEL and EQ_LANE_SEL fields in the SD_EQ_CONTROL1_REG register.Each field is available when Equalization finished successfully(EQ_CONVERGENCE_INFO=1).For more details, see the RAS DES section in the Core Operations chapter of the Databook.

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

14.4.3.9.2 Detail Registers Description

PCIE_DSP_PF0_RAS_DES_CAP_RAS_DES_CAP_HEADER_REG

Address: Operational Base(0x00000170) + offset (0x0000)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:20	RO	0x000	NEXT_OFFSET Next Capability Offset. This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI-compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.
19:16	RO	0x1	CAP_VERSION Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. Value of this field is depends on the version of the specification. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.
15:0	RO	0x000b	EXTENDED_CAP_ID PCI Express Extended Capability ID. This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. Extended Capability ID for the Vendor-Specific Extended Capability is 000Bh. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.

PCIE_DSP_PF0_RAS_DES_CAP_VENDOR_SPECIFIC_HEADER_REG

Address: Operational Base(0x00000170) + offset (0x0004)

Bit	Attr	Reset Value	Description
31:20	RO	0x100	VSEC_LENGTH VSEC Length. This field indicates the number of bytes in the entire VSEC structure, including the Vendor-Specific Extended Capability Header, the Vendor-Specific Header, and the vendor-specific registers.
19:16	RO	0x4	VSEC_REV VSEC Rev. This field is a vendor-defined version number that indicates the version of the VSEC structure. Software must qualify the Vendor ID and VSEC ID before interpreting this field.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
15:0	RO	0x0002	VSEC_ID VSEC ID. This field is a vendor-defined ID number that indicates the nature and format of the VSEC structure. Software must qualify the Vendor ID before interpreting this field.

PCIE_DSP_PF0_RAS_DES_CAP_EVENT_COUNTER_CONTROL_REG

Address: Operational Base(0x00000170) + offset (0x0008)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	RSVDP_28 Reserved for future use.
27:16	RW	0x000	EVENT_COUNTER_EVENT_SELECT Event Counter Data Select. This field in conjunction with the EVENT_COUNTER_LANE_SELECT field indexes the Event Counter data returned by the EVENT_COUNTER_DATA_REG register. - 27-24: Group number(4-bit: 0..0x7) - 23-16: Event number(8-bit: 0..0x13) within the Group - .. For detailed definitions of Group number and Event number, see the RAS DES chapter in the Databook. Note: This register field is sticky.
15:12	RO	0x0	RSVDP_12 Reserved for future use.
11:8	RW	0x0	EVENT_COUNTER_LANE_SELECT Event Counter Lane Select. This field in conjunction with EVENT_COUNTER_EVENT_SELECT indexes the Event Counter data returned by the EVENT_COUNTER_DATA_REG register. Note: This register field is sticky.
7	RO	0x0	EVENT_COUNTER_STATUS Event Counter Status. This register returns the current value of the Event Counter selected by the following fields: - EVENT_COUNTER_EVENT_SELECT - EVENT_COUNTER_LANE_SELECT Note: This register field is sticky.
6:5	RO	0x0	RSVDP_5 Reserved for future use.
4:2	WO	0x0	EVENT_COUNTER_ENABLE Event Counter Enable. Enables/disables the Event Counter selected by the EVENT_COUNTER_EVENT_SELECT and EVENT_COUNTER_LANE_SELECT fields in this register. By default, all event counters are disabled. You can enable/disable a specific Event Counter by writing the 'per event off' or 'per event on' codes. You can enable/disable all event counters by writing the 'all on' or 'all off' codes. The read value is always '0'. For other values no change.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
1:0	WO	0x0	EVENT_COUNTER_CLEAR Event Counter Clear. Clears the Event Counter selected by the EVENT_COUNTER_EVENT_SELECT and EVENT_COUNTER_LANE_SELECT fields in this register. You can clear the value of a specific Event Counter by writing the 'per clear' code and you can clear all event counters at once by writing the 'all clear' code. The read value is always '0'. Other values are reserved.

PCIE_DSP_PF0_RAS_DES_CAP_EVENT_COUNTER_DATA_REG

Address: Operational Base(0x00000170) + offset (0x000C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	EVENT_COUNTER_DATA Event Counter Data. This register returns the data selected by the following fields: - EVENT_COUNTER_EVENT_SELECT in EVENT_COUNTER_CONTROL_REG Note: This register field is sticky.

PCIE_DSP_PF0_RAS_DES_CAP_TIME_BASED_ANALYSIS_CONTROL_REG

Address: Operational Base(0x00000170) + offset (0x0010)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	TIME_BASED_REPORT_SELECT Time-based Report Select. Selects what type of data is measured for the selected duration (TIME_BASED_DURATION_SELECT), and returned in TIME_BASED_ANALYSIS_DATA. Each type of data is measured using one of three types of units: - Core_clk Cycles for 2.5GT/s, 5.0GT/s, 8.0GT/s, 16.0GT/s, 32GT/s. Total time in ps is [Value of TIME_BASED_ANALYSIS_DATA returned when TIME_BASED_REPORT_SELECT=0x00] * TIME_BASED_ANALYSIS_DATA. Values 0-4 and 7-8 correspond to Core_clk Cycles for 2.5GT/s, 5.0GT/s, 8.0GT/s, 16.0GT/s, 32GT/s. - Aux_clk Cycles. Total time in ps is [Period of platform specific clock] * TIME_BASED_ANALYSIS_DATA. Values 5, 6, and 9 correspond to aux_clk Cycles. - Core_clk Cycles for 20GT/s, 25GT/s (CCIX ESM data rate). Total time in ps is [Value of TIME_BASED_ANALYSIS_DATA returned when TIME_BASED_REPORT_SELECT=0x10] * TIME_BASED_ANALYSIS_DATA. Values 10-14 and 17-18 correspond to Core_clk Cycles for 2.5GT/s, 5.0GT/s, 8.0GT/s, 16.0GT/s, 32GT/s. - Data Bytes. Actual amount of bytes is 16 * TIME_BASED_ANALYSIS_DATA. Values 20-23 correspond to data bytes. All encodings other than the defined encodings are reserved. Note: This register field is sticky.
23:16	RO	0x00	RSVDP_16 Reserved for future use.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
15:8	RW	0x01	TIME_BASED_DURATION_SELECT Time-based Duration Select. Selects the duration of time-based analysis. When "manual control" is selected and TIMER_START is set to '1', this analysis never stops until TIMER_STOP is set to '0'. All encodings other than the defined encodings are reserved. Note: This register field is sticky.
7:1	RO	0x00	RSVDP_1 Reserved for future use.
0	RW	0x0	TIMER_START Timer Start. This bit will be cleared automatically when the measurement is finished. Note: The app_ras_des_tba_ctrl input also sets the contents of this field and controls the measurement start/stop. Note: This register field is sticky.

PCIE_DSP_PF0_RAS_DES_CAP_TIME_BASED_ANALYSIS_DATA_REG

Address: Operational Base(0x00000170) + offset (0x0014)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	TIME_BASED_ANALYSIS_DATA Time Based Analysis Data. This register returns the data selected by the TIME_BASED_REPORT_SELECT field in TIME_BASED_ANALYSIS_CONTROL_REG. The results are cleared when next measurement starts. Note: This register field is sticky.

PCIE_DSP_PF0_RAS_DES_CAP_TIME_BASED_ANALYSIS_DATA_63_32_REG

Address: Operational Base(0x00000170) + offset (0x0018)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	TIME_BASED_ANALYSIS_DATA_63_32 Upper 32 bits of Time Based Analysis Data. Note: This register field is sticky.

PCIE_DSP_PF0_RAS_DES_CAP_EINJ_ENABLE_REG

Address: Operational Base(0x00000170) + offset (0x0030)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	RSVDP_7 Reserved for future use.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
6	RW	0x0	ERROR_INJECTION6_ENABLE Error Injection6 Enable (Specific TLP Error). Enables insertion of errors into the packets that you select. You can set this bit to '1' when you have disabled RAS datapath protection (DP) by setting CX_RASDP = CX_RASDP_RAM_PROT =0. You can set this bit to '1' when you have disabled the address translation by setting ADDR_TRANSLATION_SUPPORT_EN=0. For more details, see the EINJ6_COMPARE_*_REG/EINJ6_CHANGE_*_REG/EINJ6_TLP_REG registers. Note: This register field is sticky.
5	RW	0x0	ERROR_INJECTION5_ENABLE Error Injection5 Enable (TLP Duplicate/Nullify Error). Enables insertion of duplicate/nullified TLPs. For more details, see the EINJ5_SP_TLP_REG register. Note: This register field is sticky.
4	RW	0x0	ERROR_INJECTION4_ENABLE Error Injection4 Enable (FC Credit Update Error). Enables insertion of errors into UpdateFCs. For more details, see the EINJ4_FC_REG register. Note: This register field is sticky.
3	RW	0x0	ERROR_INJECTION3_ENABLE Error Injection3 Enable (Symbol DataK Mask Error or Sync Header Error). Enables DataK masking of special symbols or the breaking of the sync header. For more details, see the EINJ3_SYMBOL_REG register. Note: This register field is sticky.
2	RW	0x0	ERROR_INJECTION2_ENABLE Error Injection2 Enable (DLLP Error). Enables insertion of DLLP errors. For more details, see the EINJ2_DLLP_REG register. Note: This register field is sticky.
1	RW	0x0	ERROR_INJECTION1_ENABLE Error Injection1 Enable (Sequence Number Error). Enables insertion of errors into sequence numbers. For more details, see the EINJ1_SEQNUM_REG register. Note: This register field is sticky.
0	RW	0x0	ERROR_INJECTION0_ENABLE Error Injection0 Enable (CRC Error). Enables insertion of errors into various CRC. For more details, see the EINJ0_CRC_REG register. Note: This register field is sticky.

PCIE_DSP_PF0_RAS_DES_CAP_EINJ0_CRC_REG

Copyright © 2024 Rockchip Electronics Co., Ltd.

Address: Operational Base(0x00000170) + offset (0x0034)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	RSVDP_12 Reserved for future use.
11:8	RW	0x0	EINJ0_CRC_TYPE Error injection type. Selects the type of CRC error to be inserted. All encodings other than the defined encodings are reserved. Note: This register field is sticky.
7:0	RW	0x00	EINJ0_COUNT Error injection count. Indicates the number of errors. This register is decremented when the errors have been inserted. - If the counter value is 0x01 and error is inserted, ERROR_INJECTION0_ENABLE in EINJ_ENABLE_REG returns 0b. - If the counter value is 0x00 and ERROR_INJECTION0_ENABLE=1, the errors are inserted until ERROR_INJECTION0_ENABLE is set to '0'. Note: This register field is sticky.

PCIE_DSP_PF0_RAS_DES_CAP_EINJ1_SEQNUM_REG

Address: Operational Base(0x00000170) + offset (0x0038)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	RSVDP_29 Reserved for future use.
28:16	RW	0x0000	EINJ1_BAD_SEQNUM Bad sequence number. Indicates the value to add/subtract from the naturally-assigned sequence numbers. This value is represented by two's complement. For example: - Set Type, SEQ# and Count -- EINJ1_SEQNUM_TYPE =0 (Insert errors into new TLPs) -- EINJ1_BAD_SEQNUM =0x1FFD (represents -3) -- EINJ1_COUNT =1 - Enable Error Injection -- ERROR_INJECTION1_ENABLE =1 - Send a TLP From the Core's Application Interface -- Assume SEQ#5 is given to the TLP. - The SEQ# is Changed to #2 by the Error Injection Function in Layer2. -- 5 + (-3) = 2 - The TLP with SEQ#2 is Transmitted to PCIe Link. Note: This register field is sticky.
15:9	RO	0x00	RSVDP_9 Reserved for future use.
8	RW	0x0	EINJ1_SEQNUM_TYPE Sequence number type. Selects the type of sequence number. Note: This register field is sticky.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
7:0	RW	0x00	EINJ1_COUNT Error injection count. Indicates the number of errors. This register is decremented as the errors are being inserted. - If the counter value is 0x01 and error is inserted, ERROR_INJECTION1_ENABLE in EINJ_ENABLE_REG returns '0'. - If the counter value is 0x00 and ERROR_INJECTION1_ENABLE=1, the errors are inserted until ERROR_INJECTION1_ENABLE is set to '0'. Note: This register field is sticky.

PCIE_DSP_PF0_RAS_DES_CAP_EINJ2_DLLP_REG

Address: Operational Base(0x00000170) + offset (0x003C)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	RSVDP_10 Reserved for future use.
9:8	RW	0x0	EINJ2_DLLP_TYPE DLLP Type. Selects the type of DLLP errors to be inserted. Note: This register field is sticky.
7:0	RW	0x00	EINJ2_COUNT Error injection count. Indicates the number of errors. This register is decremented as the errors are being inserted. - If the counter value is 0x01 and the error is inserted, ERROR_INJECTION2_ENABLE in EINJ_ENABLE_REG returns '0'. - If the counter value is 0x00 and ERROR_INJECTION2_ENABLE =1, the errors are inserted until ERROR_INJECTION2_ENABLE is set to '0'. This register is affected only when EINJ2_DLLP_TYPE =2'10b. Note: This register field is sticky.

PCIE_DSP_PF0_RAS_DES_CAP_EINJ3_SYMBOL_REG

Address: Operational Base(0x00000170) + offset (0x0040)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	RSVDP_11 Reserved for future use.
10:8	RW	0x0	EINJ3_SYMBOL_TYPE Error Type. 8b/10b encoding - Mask K symbol. It is not supported to insert errors into the first ordered-set after exiting from TxElecIdle when CX_FREQ_STEP_EN has been enabled. All encodings other than the defined encodings are reserved. Note: This register field is sticky.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
7:0	RW	0x00	EINJ3_COUNT Error injection count. Indicates the number of errors. This register is decremented as the errors are being inserted. - If the counter value is 0x01 and error is inserted, ERROR_INJECTION3_ENABLE in EINJ_ENABLE_REG returns '0'. - If the counter value is 0x00 and ERROR_INJECTION3_ENABLE =1, the errors are inserted until ERROR_INJECTION3_ENABLE is set to '0'. Note: This register field is sticky.

PCIE_DSP_PF0_RAS_DES_CAP_EINJ4_FC_REG

Address: Operational Base(0x00000170) + offset (0x0044)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	RSVDP_29 Reserved for future use.
28:16	RW	0x0000	EINJ4_BAD_UPDFC_VALUE Bad update-FC credit value. Indicates the value to add/subtract from the UpdateFC credit. This value is represented by two's complement. Note: This register field is sticky.
15	RO	0x0	RSVDP_15 Reserved for future use.
14:12	RW	0x0	EINJ4_VC_NUMBER VC Number. Indicates target VC Number. Note: This register field is sticky.
11	RO	0x0	RSVDP_11 Reserved for future use.
10:8	RW	0x0	EINJ4_UPDFC_TYPE Update-FC type. Selects the credit type. Note: This register field is sticky.
7:0	RW	0x00	EINJ4_COUNT Error injection count. Indicates the number of errors. This register is decremented as the errors are being inserted. - If the counter value is 0x01 and error is inserted, ERROR_INJECTION4_ENABLE in EINJ_ENABLE_REG returns '0'. - If the counter value is 0x00 and ERROR_INJECTION4_ENABLE =1, the errors are inserted until ERROR_INJECTION4_ENABLE is set to '0'. Note: This register field is sticky.

PCIE_DSP_PF0_RAS_DES_CAP_EINJ5_SP_TLP_REG

Address: Operational Base(0x00000170) + offset (0x0048)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	RSVDP_9 Reserved for future use.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
8	RW	0x0	EINJ5_SPECIFIED_TLP Specified TLP. Selects the specified TLP to be inserted. Note: This register field is sticky.
7:0	RW	0x00	EINJ5_COUNT Error injection count. Indicates the number of errors. This register is decremented as the errors are being inserted. - If the counter value is 0x01 and error is inserted, ERROR_INJECTION5_ENABLE in EINJ_ENABLE_REG returns '0'. - If the counter value is 0x00 and ERROR_INJECTION5_ENABLE =1, the errors are inserted until ERROR_INJECTION5_ENABLE is set to '0'. Note: This register field is sticky.

PCIE_DSP_PF0_RAS_DES_CAP_EINJ6_COMPARE_POINT_H0_REG

Address: Operational Base(0x00000170) + offset (0x004C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	EINJ6_COMPARE_POINT_H0 Packet Compare Point: 1st DWORD. Specifies which Tx TLP header DWORD#0 bits to compare with the corresponding bits in the Packet Compare Value registers (EINJ6_COMPARE_VALUE*). When all specified bits (in the Tx TLP header and EINJ6_COMPARE_VALUE*) match, the controller inserts errors into the TLP. Note: This register field is sticky.

31:8	RO	0x000000	RSVDP_8 Reserved for future use.
7	RO	0x0	EQ_REJECT_EVENT EQ Reject Event. Indicates that the controller receives two consecutive TS1 OS w/Reject=1b during EQ Master phase(DSP in EQ Phase3/USP in EQ Phase2). This bit is automatically cleared when the controller starts EQ Master phase again. Note: This register field is sticky.
6	RO	0x0	EQ_RULEC_VIOLATION EQ Rule C Violation. Indicates that coefficients rule C violation is detected in the values provided by PHY using direction change method during EQ Master phase(DSP in EQ Phase3/USP in EQ Phase2). The coefficients rule C correspond to the rules c) from section "Rules for Transmitter Coefficents" in the PCI Express Base Specification. This bit is automatically cleared when the controller starts EQ Master phase again. Note: This register field is sticky.
5	RO	0x0	EQ_RULEB_VIOLATION EQ Rule B Violation. Indicates that coefficients rule B violation is detected in the values provided by PHY using direction change method during EQ Master phase(DSP in EQ Phase3/USP in EQ Phase2). The coefficients rules B correspond to the rules b) from section "Rules for Transmitter Coefficents" in the PCI Express Base Specification. This bit is automatically cleared when the controller starts EQ Master phase again. Note: This register field is sticky.

Bit	Attr	Reset Value	Description
4	RO	0x0	EQ_RULEA_VIOLATION EQ Rule A Violation. Indicates that coefficients rule A violation is detected in the values provided by PHY using direction change method during EQ Master phase(DSP in EQ Phase3/USP in EQ Phase2). The coefficients rules A correspond to the rules a) from section "Rules for Transmitter Coefficents" in the PCI Express Base Specification. This bit is automatically cleared when the controller starts EQ Master phase again. Note: This register field is sticky.
3	RO	0x0	RSVDP_3 Reserved for future use.
2:1	RO	0x0	EQ_CONVERGENCE_INFO EQ Convergence Info. Indicates equalization convergence information. This bit is automatically cleared when the controller starts EQ Master phase again. Note: This register field is sticky.
0	RO	0x0	EQ_SEQUENCE EQ Sequence. Indicates that the controller is starting the equalization sequence. Note: This register field is sticky.

PCIE_DSP_PF0_RAS_DES_CAP_SD_EQ_STATUS2_REG

Address: Operational Base(0x00000170) + offset (0x00E4)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	EQ_LOCAL_FOM_VALUE EQ Local Figure of Merit. Indicates Local maximum Figure of Merit value. Note: This register field is sticky.
23:21	RO	0x0	RSVDP_21 Reserved for future use.
20:18	RO	0x0	EQ_LOCAL_RX_HINT EQ Local Receiver Preset Hint. Indicates Local Receiver Preset Hint value. If select rate in the EQ_RATE_SEL field is other than 8.0GT/s Speed, this feature is not available. Note: This register field is sticky.
17:12	RO	0x00	EQ_LOCAL_POST_CURSOR EQ Local Post-Cursor. Indicates Local post cursor coefficient value. Note: This register field is sticky.
11:6	RO	0x00	EQ_LOCAL_CURSOR EQ Local Cursor. Indicates Local cursor coefficient value. Note: This register field is sticky.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
5:0	RO	0x00	EQ_LOCAL_PRE_CURSOR EQ Local Pre-Cursor. Indicates Local pre cursor coefficient value. Note: This register field is sticky.

PCIE_DSP_PF0_RAS_DES_CAP_SD_EQ_STATUS3_REG

Address: Operational Base(0x00000170) + offset (0x00E8)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	RSVDP_30 Reserved for future use.
29:24	RO	0x00	EQ_REMOTE_FS EQ Remote FS. Indicates Remote FS value. Note: This register field is sticky.
23:18	RO	0x00	EQ_REMOTE_LF EQ Remote LF. Indicates Remote LF value. Note: This register field is sticky.
17:12	RO	0x00	EQ_REMOTE_POST_CURSOR EQ Remote Post-Cursor. Indicates Remote post cursor coefficient value. Note: This register field is sticky.
11:6	RO	0x00	EQ_REMOTE_CURSOR EQ Remote Cursor. Indicates Remote cursor coefficient value. Note: This register field is sticky.
5:0	RO	0x00	EQ_REMOTE_PRE_CURSOR EQ Remote Pre-Cursor. Indicates Remote pre cursor coefficient value. Note: This register field is sticky.

14.4.3.10 PCIE_DSP_PF0_PORT_LOGIC Register Description

14.4.3.10.1 Registers Summary

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_PORT_LOGIC_ACK_LATENCY_TIMER_OFF	0x0000	W	0x0C23040B	This register holds the ack latency timer limit and replay timer limit values.
PCIE_DSP_PF0_PORT_LOGIC_VENDOR_SPEC_DLLP_OFF	0x0004	W	0xFFFFFFFF	This register holds the vendor specific DLLP.
PCIE_DSP_PF0_PORT_LOGIC_PORT_FORCE_OFF	0x0008	W	0x00000004	This register can be used for testing and debuggong the link.
PCIE_DSP_PF0_PORT_LOGIC_ACK_F_ASPM_CTRL_OFF	0x000C	W	0x1BFFFF00	This register is used to control ack frequency and L0-L1 ASPM behaviour.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_PORT_LOGIC_PORT_LINK_CTRL_OFF	0x0010	W	0x00010120	Using this register you can control the port link behaviour.
PCIE_DSP_PF0_PORT_LOGIC_LANE_SKEW_OFF	0x0014	W	0x00000000	This register is used to control the lane skew behaviour.
PCIE_DSP_PF0_PORT_LOGIC_TIMER_CTRL_MAX_FUNC_NUM_OFF	0x0018	W	0x00018000	This register holds the ack frequency, latency, replay, fast link scaling timers, and max function number values.
PCIE_DSP_PF0_PORT_LOGIC_SYMBOL_TIMER_FILTER_1_OFF	0x001C	W	0x00000140	The Filter Mask 1 Register modifies the RADM filtering and error handling rules. For more details, see the "Receive Filtering" section. In each case, '0' applies the associated filtering rule and '1' masks the associated filtering rule.
PCIE_DSP_PF0_PORT_LOGIC_FILTER_MASK_2_OFF	0x0020	W	0x00000000	This register modifies the RADM filtering and error handling rules. For more details, see the "Receive Filtering" section. In each case, '0' applies the associated filtering rule and '1' masks the associated filtering rule.
PCIE_DSP_PF0_PORT_LOGIC_AMBA_MUL_OB_DECOMP_NP_SUB_REQ_CTRL_OFF	0x0024	W	0x00000001	This register controls multiple outbound decomposed NP subRequests operation.
PCIE_DSP_PF0_PORT_LOGIC_PL_DEBUG0_OFF	0x0028	W	0x00000000	This register holds cxpl_debug_info[31:0].
PCIE_DSP_PF0_PORT_LOGIC_PL_DEBUG1_OFF	0x002C	W	0x00000000	This register holds cxpl_debug_info[63:32].
PCIE_DSP_PF0_PORT_LOGIC_TX_P_FC_CREDIT_STATUS_OFF	0x0030	W	0x00000000	This register provides transmit posted FC credit status.
PCIE_DSP_PF0_PORT_LOGIC_TX_NP_FC_CREDIT_STATUS_OFF	0x0034	W	0x00000000	This register provides the transmit Non-Posted FC credit status.
PCIE_DSP_PF0_PORT_LOGIC_TX_CPL_FC_CREDIT_STATUS_OFF	0x0038	W	0x00000000	This register provides transmit completion FC credit status.
PCIE_DSP_PF0_PORT_LOGIC_QUEUE_STATUS_OFF	0x003C	W	0x00000000	This register provides the queue status.
PCIE_DSP_PF0_PORT_LOGIC_VC_TX_ARBI_1_OFF	0x0040	W	0x0000000F	This register is used for setting the WRR weights for VC0 - VC3.
PCIE_DSP_PF0_PORT_LOGIC_VC_TX_ARBI_2_OFF	0x0044	W	0x00000000	This register is used for setting the WRR weights for VC4 - VC7.
PCIE_DSP_PF0_PORT_LOGIC_VC0_P_RX_Q_CTRL_OFF	0x0048	W	0x45217038	This register controls segmented-buffer VC0 posted receive queue operation.
PCIE_DSP_PF0_PORT_LOGIC_VC0_NP_RX_Q_CTRL_OFF	0x004C	W	0x05217005	This register controls the segmented-buffer VC0 non-posted receive queue operation.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_PORT_LOGIC_VC0_CPL_RX_Q_CTRL_OFF	0x0050	W	0x05200000	This register controls the segmented-buffer VC0 completion receive queue operation.
PCIE_DSP_PF0_PORT_LOGIC_GEN2_CTRL_OFF	0x010C	W	0x000001FF	This register controls various functions of the controller related to link training, lane reversal, and equalization.
PCIE_DSP_PF0_PORT_LOGIC_PHY_STATUS_OFF	0x0110	W	0x00000000	Memory mapped register from phy_cfg_status GPIO input pins.
PCIE_DSP_PF0_PORT_LOGIC_PHY_CONTROL_OFF	0x0114	W	0x00000000	Memory mapped register to cfg_phy_control GPIO output pins.
PCIE_DSP_PF0_PORT_LOGIC_TRGT_MAP_CTRL_OFF	0x011C	W	0x0000007F	This register controls the target map.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_ADDR_OFF	0x0120	W	0x00000000	This register holds the integrated MSI reception module address.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_UPPER_ADDR_OFF	0x0124	W	0x00000000	This register holds the integrated MSI reception module upper address.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_0_EN_OFF	0x0128	W	0x00000000	This register enables integrated MSI reception module interrupt0.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_0_MASK_OFF	0x012C	W	0x00000000	This register provides information regarding the MSI Interrupt0 mask.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_0_STATUS_OFF	0x0130	W	0x00000000	This register provides the MSI Interrupt0 status.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_1_EN_OFF	0x0134	W	0x00000000	This register enables integrated MSI reception module interrupt1.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_1_MASK_OFF	0x0138	W	0x00000000	This register provides information regarding the MSI Interrupt1 mask.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_1_STATUS_OFF	0x013C	W	0x00000000	This register provides the MSI Interrupt1 status.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_2_EN_OFF	0x0140	W	0x00000000	This register enables integrated MSI reception module interrupt2.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_2_MASK_OFF	0x0144	W	0x00000000	This register provides information regarding the MSI Interrupt2 mask.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_2_STATUS_OFF	0x0148	W	0x00000000	This register provides the MSI Interrupt2 status.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_3_EN_OFF	0x014C	W	0x00000000	This register enables integrated MSI reception module interrupt3.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_3_MASK_OFF	0x0150	W	0x00000000	This register provides information regarding the MSI Interrupt3 mask.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_3_STATUS_OFF	0x0154	W	0x00000000	This register provides the MSI Interrupt3 status.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_4_EN_OFF	0x0158	W	0x00000000	This register enables integrated MSI reception module interrupt4.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_4_MASK_OFF	0x015C	W	0x00000000	This register provides information regarding the MSI Interrupt4 mask.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_4_STATUS_OFF	0x0160	W	0x00000000	This register provides the MSI Interrupt4 status.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_5_EN_OFF	0x0164	W	0x00000000	This register enables integrated MSI reception module interrupt5.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_5_MASK_OFF	0x0168	W	0x00000000	This register provides information regarding the MSI Interrupt5 mask.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_5_STATUS_OFF	0x016C	W	0x00000000	This register provides the MSI Interrupt5 status.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_6_EN_OFF	0x0170	W	0x00000000	This register enables integrated MSI reception module interrupt6.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_6_MASK_OFF	0x0174	W	0x00000000	This register provides information regarding the MSI Interrupt6 mask.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_6_STATUS_OFF	0x0178	W	0x00000000	This register provides the MSI Interrupt6 status.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_7_EN_OFF	0x017C	W	0x00000000	This register enables integrated MSI reception module interrupt7.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_7_MASK_OFF	0x0180	W	0x00000000	This register provides information regarding the MSI Interrupt7 mask.
PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_7_STATUS_OFF	0x0184	W	0x00000000	This register provides the MSI Interrupt7 status.
PCIE_DSP_PF0_PORT_LOGIC_MSI_GPIO_IO_OFF	0x0188	W	0x00000000	The contents of this register drive the top-level GPIO msi_ctrl_io[31:0].
PCIE_DSP_PF0_PORT_LOGIC_CLOCK_GATING_CTRL_OFF	0x018C	W	0x00000003	This register enables you to disable dynamic clock gating. By default dynamic clock gating is on, allowing the controller to autonomously enable and disable its clocks. The clock gating is performed in the clock and reset module, DWC_pcie_clk_rst.v, and is initiated by the controllers clock enable signals. The following modules support dynamic clock gating: - AXI Bridge - RADM

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_PORT_LOGIC_GEN3_RELATED_OFF	0x0190	W	0x00002001	There is no Gen3-specific N_FTS field. The N_FTS field in the "Link Width and Speed Change Control Register" is used for both Gen2 and Gen3 speed modes. There is no Gen3-specific "Directed Speed Change" field. The "Directed Speed Change" field in the "Link Width and Speed Change Control Register" is used to change to Gen2 or Gen3 speed. A speed change to Gen3 occurs if (1) the "Directed Speed Change" field is set to '1' and (2) the "Target Link Speed" field in the Link Control 2 Register is set to Gen3. Gen3 support is advertised by both sides of the link during link training.
PCIE_DSP_PF0_PORT_LOGIC_GEN3_EQ_CONTROL_OFF	0x01A8	W	0x04059F61	This register controls equalization for Phase2 in an upstream port (USP), or Phase3 in a downstream port (DSP).
PCIE_DSP_PF0_PORT_LOGIC_GEN3_EQ_FB_MODE_DIR_CHANGE_OFF	0x01AC	W	0x00000040	Equalization controls to be used in Phase2 (USP) or Phase 3 (DSP), when you set the Feedback Mode in "Gen3 EQ Control Register" to "Direction Change." These fields allow control over the initial starting point for the search of optimal coefficient settings, and allow control over the criteria used to determine when the optimal settings have been achieved. The values are applied to all the lanes.
PCIE_DSP_PF0_PORT_LOGIC_ORDER_RULE_CTRL_OFF	0x01B4	W	0x00000000	This register controls the order rule.
PCIE_DSP_PF0_PORT_LOGIC_PIPE_LOOPBACK_CONTROL_OFF	0x01B8	W	0x00000001	This register controls the PIPE Loopback.
PCIE_DSP_PF0_PORT_LOGIC_MISC_CONTROL_1_OFF	0x01BC	W	0x000BFF40	This is the DBI Read-Only write enable register.
PCIE_DSP_PF0_PORT_LOGIC_MULTI_LANE_CONTROL_OFF	0x01C0	W	0x00000000	Used when upsizing or downsizing the link width through Configuration state without bringing the link down.For more details, see the "Link Establishment" section in the "ControllerOperations" chapter of the Databook.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_PORT_LOGIC_PHY_INTEROP_CTRL_OFF	0x01C4	W	0x0001E201	This register controls the PHY interoperability.
PCIE_DSP_PF0_PORT_LOGIC_TRGT_CPL_LUT_DELETE_ENTRY_OFF	0x01C8	W	0x00000000	Using this register you can delete one entry in the target completion LUT. You should only use this register when you know that your application will never send the completion because of an FLR or any other reason.Note:: The target completion LUT (and associated target completion timeout event) is watching for completions (from your application on XALI0/1/2 or AXI master read channel) corresponding to previously received non-posted requests from the PCIe wire.
PCIE_DSP_PF0_PORT_LOGIC_LINK_FLUSH_CONTROL_OFF	0x01CC	W	0xFF000001	This register controls link reset request flush behaviour.
PCIE_DSP_PF0_PORT_LOGIC_AMBA_ERROR_RESPONSE_DEFAULT_OFF	0x01D0	W	0x00009C00	This register holds the AXI bridge slave error responses.
PCIE_DSP_PF0_PORT_LOGIC_AMBA_LINK_TIMEOUT_OFF	0x01D4	W	0x00000032	If your application AXI master issues outbound requests to the AXI bridge slave interface before the PCIe link is operational, the controller starts a "flush" timer. The timeout value of the timer is set by this register. If the timer times out before the PCIe link is operational, the bridge TX request queues are flushed. For more details, see the "AXI Bridge Initialization, Clocking and Reset" section in the AXI chapter of the Databook.
PCIE_DSP_PF0_PORT_LOGIC_AMBA_ORDERING_CTRL_OFF	0x01D8	W	0x00000000	This register controls the AXI Bridge Ordering.
PCIE_DSP_PF0_PORT_LOGIC_COHERENCY_CONTROL_1_OFF	0x01E0	W	0x00000000	This register controls the ACE cache coherency operation.
PCIE_DSP_PF0_PORT_LOGIC_COHERENCY_CONTROL_2_OFF	0x01E4	W	0x00000000	This register controls the ACE cache coherency operation.
PCIE_DSP_PF0_PORT_LOGIC_COHERENCY_CONTROL_3_OFF	0x01E8	W	0x00000000	This register controls the ACE cache coherency operation.

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_PORT_LOGIC_AXI_MSTR_MSG_ADDR_LOW_OFF	0x01F0	W	0x00000000	Lower 20 bits of the programmable AXI address to which Messages coming from wire are mapped. Bits [11:0] of the register are tied to zero for the address to be 4k-aligned. In previous releases, the third and fourth DWORDs of a message (Msg/MsgD) TLP header were delivered though the AXI master address bus (mstr_awaddr). These DWORDS are now supplied through the mstr_awmisc_info_hdr_34dw[63:0] output; and the value on mstr_awaddr is driven to the value you have programmed into the AXI_MSTR_MSG_ADDR_LOW_OFF and AXI_MSTR_MSG_ADDR_HIGH_OFF registers.
PCIE_DSP_PF0_PORT_LOGIC_AXI_MSTR_MSG_ADDR_HIGH_OFF	0x01F4	W	0x00000000	Upper 32 bits of the programmable AXI address to which Messages coming from wire are mapped.
PCIE_DSP_PF0_PORT_LOGIC_PCIE_VERSION_NUMBER_OFF	0x01F8	W	0x3536302A	The version number is given in hex format. You should convert each pair of hex characters to ASCII to interpret.Using 4.70a (GA) as an example: - VERSION_NUMBER = 0x3437302a which translates to 470* - VERSION_TYPE = 0x67612a2a which translates to ga**Using 4.70a-ea01 as an example: - VERSION_NUMBER = 0x3437302a which translates to 470* - VERSION_TYPE = 0x65613031 which translates to ea01GA is a general release available on www.designware.comEA is an early release available on a per-customer basis.

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_PORT_LOGIC_PCIE_VERSION_TYPE_OFF	0x01FC	W	0x6C703035	The type is given in hex format. You should convert each pair of hex characters to ASCII to interpret.Using 4.70a (GA) as an example: - VERSION_NUMBER = 0x3437302a which translates to 470* - VERSION_TYPE = 0x67612a2a which translates to ga**Using 4.70a-ea01 as an example: - VERSION_NUMBER = 0x3437302a which translates to 470* - VERSION_TYPE = 0x65613031 which translates to ea01GA is a general release available on www.designware.comEA is an early release available on a per-customer basis.
PCIE_DSP_PF0_PORT_LOGIC_PL_APP_BUS_DEV_NUM_STATUS_OFF	0x0410	W	0x00000000	This register reflects the application driven bus and device number.
PCIE_DSP_PF0_PORT_LOGIC_PCIPM_TRAFFIC_CTRL_OFF	0x041C	W	0x00000000	This register provides control over TLP Traffic during Non-D0 States.
PCIE_DSP_PF0_PORT_LOGIC_PL_LTR_LATENCY_OFF	0x0430	W	0x00000000	The function of this register field (and all other fields in this register) differs between an upstream port and a downstream port. For an upstream port, the register fields capture the corresponding fields in the LTR messages that are transmitted by the port. For a downstream port, the register fields capture the corresponding fields in the LTR messages that are received by the port. The full content of the register is reflected on the app_ltr_latency[31:0] output.
PCIE_DSP_PF0_PORT_LOGIC_AUX_CLK_FREQ_OFF	0x0440	W	0x00000018	This register controls the auxiliary clock frequency.
PCIE_DSP_PF0_PORT_LOGIC_L1_SUBSTATES_OFF	0x0444	W	0x000000D2	This register holds L1 substates timing information.
PCIE_DSP_PF0_PORT_LOGIC_POWERDOWN_CTRL_STATUS_OFF	0x0448	W	0x00000220	This is the Powerdown Control and Status register.
PCIE_DSP_PF0_PORT_LOGIC_PIPE_RELATED_OFF	0x0490	W	0x00000000	This register controls the PIPE's capabitity, control, and status parameters.

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

14.4.3.10.2 Detail Registers Description

PCIE_DSP_PF0_PORT_LOGIC_ACK_LATENCY_TIMER_OFF

Address: Operational Base(0x00000700) + offset (0x0000)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:16	RW	0x0c23	REPLAY_TIME_LIMIT Replay Timer Limit. The replay timer expires when it reaches this limit. The controller initiates a replay upon reception of a NAK or when the replay timer expires. For more details, see "Transmit Replay" in the Databook. - You can modify the effective timer limit through the TIMER_MOD_REPLAY_TIMER field of the TIMER_CTRL_MAX_FUNC_NUM_OFF register. - After reset, the controller updates the default according to the Negotiated Link Width, Max_Payload_Size, and speed. The value is determined from Tables 3-4, 3-5, and 3-6 of the PCI Express Base Specification. - If there is a change in the payload size or link speed, the controller overrides any value that you have written to this register field, and resets the field back to the specification-defined value. The controller does not change the value in the TIMER_MOD_REPLAY_TIMER field of the TIMER_CTRL_MAX_FUNC_NUM_OFF register.
15:0	RW	0x040b	ROUND_TRIP_LATENCY_TIME_LIMIT Ack Latency Timer Limit. The Ack latency timer expires when it reaches this limit. For more details, see "ACK/NAK Scheduling" in the Databook. - You can modify the effective timer limit through the TIMER_MOD_ACK_NAK field of the TIMER_CTRL_MAX_FUNC_NUM_OFF register. - After reset, the controller updates the default according to the Negotiated Link Width, Max_Payload_Size, and speed. The value is determined from Tables 3-7, 3-8, and 3-9 of the PCI Express Base Specification. - The limit must reflect the round trip latency from requester to completer. - If there is a change in the payload size or link width, the controller overrides any value that you have written to this register field, and resets the field back to the specification-defined value. The controller does not change the value in the TIMER_MOD_ACK_NAK field of the TIMER_CTRL_MAX_FUNC_NUM_OFF register.

PCIE_DSP_PF0_PORT_LOGIC_VENDOR_SPEC_DLLP_OFF

Address: Operational Base(0x00000700) + offset (0x0004)

Bit	Attr	Reset Value	Description
31:0	RW	0xffffffff	VENDOR_SPEC_DLLP Vendor Specific DLLP Register. You can use this register to send a specific PCI Express DLLP. Your application can write 8-bit DLLP Type and 24-bit Payload data into this register, and set the VENDOR_SPECIFIC_DLLP_REQ field of the PORT_LINK_CTRL_OFF, to send the DLLP. - Bits[7:0]: DLLP Type - Bits[31:8]: Vendor Defined Payload (24 bits) Note: This register field is sticky.

PCIE_DSP_PF0_PORT_LOGIC_PORT_FORCE_OFF

Address: Operational Base(0x00000700) + offset (0x0008)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:24	RO	0x00	RSVDP_24 Reserved for future use.
23	RW	0x0	DO_DESKEW_FOR_SRIS Use the transitions from TS2 to Logical Idle Symbol, SKP OS to Logical Idle Symbol, EIEOS to Logical Idle Symbol, and FTS Sequence to SKP OS to do deskew instead of using received SKP OS or TS1 to TS2 transition if DO_DESKEW_FOR_SRIS is set to '1'. Note: This register field is sticky.
22	RW	0x0	SUPPORT_PART_LANES_RXEI_EXIT Support LTSSM transition from Polling.Active to Polling.Config based on Rx 8 TSs on any lanes which are Rx EI exit too from base spec after 24ms timeout. This prevents some lanes detected but not Rx EI exit and LTSSM cannot move to Polling.Config. You must set the parameter CX_AUTO_LANE_FLIP_CTRL_EN true for the auto lanes reversal. Note: This register field is sticky.
21:16	RW	0x00	LINK_STATE Forced LTSSM State. The LTSSM state that the controller is forced to when you set the FORCE_EN bit (Force Link). LTSSM state encoding is defined by the lts_state variable in workspace/src/Layer1/smlh_ltssm.v. Note: This register field is sticky.
15	WO	0x0	FORCE_EN Force Link. The controller supports a testing and debug capability to allow your software to force the LTSSM state machine into a specific state, and to force the controller to transmit a specific Link Command. Asserting this bit triggers the following actions: - Forces the LTSSM to the state specified by the Forced LTSSM State field. - Forces the controller to transmit the command specified by the Forced Link Command field. This is a self-clearing register field. Reading from this register field always returns a '0'.
14:12	RO	0x0	RSVDP_12 Reserved for future use.
11:8	RW	0x0	FORCED_LTSSM Forced Link Command. The link command that the controller is forced to transmit when you set FORCE_EN bit (Force Link). Link command encoding is defined by the ltssm_cmd variable in workspace/src/Layer1/smlh_ltssm.v. Note: This register field is sticky.
7:0	RW	0x04	LINK_NUM Link Number. Not used for endpoint. Note: This register field is sticky.

Bit	Attr	Reset Value	Description
7:0	RW	0x00	ACK_FREQ Ack Frequency. The controller accumulates the number of pending ACKs specified here (up to 255) before scheduling an ACK DLLP. - 0: Indicates that this Ack Frequency Counter feature is turned off. The controller generates a low-priority ACK request for every TLP that it receives. The controller waits until the ACK Latency Timer expires, then converts the current low-priority ACK request to a high-priority ACK request and schedules the DLLP for transmission to the remote link partner. - 1-255: Indicates that the controller will schedule a high-priority ACK after receiving this number of TLPs. It might schedule the ACK before receiving this number of TLPs if the ACK Latency Timer expires, but never later. For a typical system, you do not have to modify the default setting. For more details, see "ACK/NAK Scheduling" in the Databook. Note: This register field is sticky.

PCIE_DSP_PF0_PORT_LOGIC_SYMBOL_TIMER_FILTER_1_OFF

Address: Operational Base(0x00000700) + offset (0x001C)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	MASK_RADM_1 Filter Mask 1. The Filter Mask 1 Register modifies the RADM filtering and error handling rules. For more details, see the "Receive Filtering" section. In each case, '0' applies the associated filtering rule and '1' masks the associated filtering rule. [31]: CX_FLT_MASK_RC_CFG_DISCARD - 0: For RADM RC filter to not allow CFG transaction being received - 1: For RADM RC filter to allow CFG transaction being received [30]: CX_FLT_MASK_RC_IO_DISCARD - 0: For RADM RC filter to not allow IO transaction being received - 1: For RADM RC filter to allow IO transaction being received [29]: CX_FLT_MASK_MSG_DROP - 0: Drop MSG TLP (except for Vendor MSG). Send decoded message on the SII. - 1: Do not Drop MSG (except for Vendor MSG). Send message TLPs to your application on TRGT1 and send decoded message on the SII. - The default for this bit is the inverse of FLT_DROP_MSG. That is, if FLT_DROP_MSG =1, then the default of this bit is '0' (drop message TLPs). This bit only controls message TLPs other than Vendor MSGs. Vendor MSGs are controlled by Filter Mask Register 2, bits [1:0]. The controller never passes ATS Invalidate messages to the SII interface regardless of this filter rule setting. The controller passes all ATS Invalidate messages to TRGT1 (or AXI bridge master), as they are too big for the SII. [28]: CX_FLT_MASK_CPL_ECRC_DISCARD - Only used when completion queue is advertised with infinite credits and is in store-and-forward mode. - 0: Discard completions with ECRC errors - 1: Allow completions with ECRC errors to be passed up - Reserved field for SW. [27]: CX_FLT_MASK_ECRC_DISCARD - 0: Discard TLPs with ECRC errors - 1: Allow TLPs with ECRC errors to be passed up [26]: CX_FLT_MASK_CPL_LEN_MATCH - 0: Enforce length match for completions; a violation results in cpl_abort, and possibly AER of unexp_cpl_err - 1: Mask length match for completions [25]: CX_FLT_MASK_CPL_ATTR_MATCH - 0: Enforce attribute match for completions; a violation results in a malformed TLP error, and possibly AER of unexp_cpl_err,

Bit	Attr	Reset Value	Description
			cpl_rcvd_ur, cpl_rcvd_ca - 1: Mask attribute match for completions [24]: CX_FLT_MASK_CPL_TC_MATCH - 0: Enforce Traffic Class match for completions; a violation results in a malformed TLP error, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca - 1: Mask Traffic Class match for completions [23]: CX_FLT_MASK_CPL_FUNC_MATCH - 0: Enforce function match for completions; a violation results in cpl_abort, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca - 1: Mask function match for completions [22]: CX_FLT_MASK_CPL_REQID_MATCH - 0: Enforce Req. Id match for completions; a violation result in cpl_abort, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca - 1: Mask Req. Id match for completions [21]: CX_FLT_MASK_CPL_TAGERR_MATCH - 0: Enforce Tag Error Rules for completions; a violation result in cpl_abort, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca - 1: Mask Tag Error Rules for completions [20]: CX_FLT_MASK_LOCKED_RD_AS_UR - 0: Treat locked Read TLPs as UR for EP; Supported for RC - 1: Treat locked Read TLPs as Supported for EP; UR for RC [19]: CX_FLT_MASK_CFG_TYPE1_REQ_AS_UR - 0: Treat CFG type1 TLPs as UR for EP; Supported for RC - 1: Treat CFG type1 TLPs as Supported for EP; UR for RC - When CX_SRIOV_ENABLE is set then this bit is set to allow the filter to process Type 1 Config requests if the EP consumes more than one bus number. [18]: CX_FLT_MASK_UR_OUTSIDE_BAR - 0: Treat out-of-bar TLPs as UR - 1: Do not treat out-of-bar TLPs as UR [17]: CX_FLT_MASK_UR_POIS - 0: Treat poisoned request TLPs as UR - 1: Do not treat poisoned request TLPs as UR - The native controller always passes poisoned completions to your application except when you are using the DMA read channel. [16]: CX_FLT_MASK_UR_FUNC_MISMATCH - 0: Treat Function MisMatched TLPs as UR - 1: Do not treat Function MisMatched TLPs as UR Note: This register field is sticky.
15	RW	0x0	DISABLE_FC_WD_TIMER Disable FC Watchdog Timer. Note: This register field is sticky.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
10:0	RW	0x140	SKP_INT_VAL SKP Interval Value. The number of symbol times to wait between transmitting SKP ordered sets. The controller waits the number of symbol times in this register plus 1, between transmitting SKP ordered sets. Your application must program this register accordingly. For example, if 1536 were programmed into this register (in a 250 MHz controller), then the controller actually transmits SKP ordered sets once every 1537 symbol times. The value programmed to this register is actually clock ticks and not symbol times. In a 125 MHz controller, programming the value programmed to this register should be scaled down by a factor of 2 (because one clock tick =two symbol times in this case). Note: This value is not used at Gen3 speed; the skip interval is hardcoded to 370 blocks. Note: This register field is sticky.

PCIE_DSP_PF0_PORT_LOGIC_GEN2_CTRL_OFF

Address: Operational Base(0x00000700) + offset (0x010C)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23	RW	0x0	SELECTABLE_DEEMPH_BIT_MUX The selectable deemphasis bit (Symbol 4 bit 6) of the transmitted TS2 Ordered Sets for DSP in Recovery.RcvrCfg state is muxed between the Selectable De-emphasis field in the Link Control 2 register and the value requested by USP in Recovery.RcvrLock state through Tx TS1s from USP. Note: This register field is sticky.
22	RW	0x0	SELECT_DEEMPH_VAR_MUX The select_deemphasis variable for DSP on entry to Recovery.RcvrCfg state is muxed between the Selectable De-emphasis field in the Link Control 2 register and the value requested by the Upstream Port in the eight consecutive TS1 Ordered Sets it received. Note: This register field is sticky.
21	RW	0x0	GEN1_EI_INFERENCE Electrical Idle Inference Mode at Gen1 Rate. Programmable mode to determine inferred electrical idle (EI) in Recovery.Speed or Loopback.Active (as slave) state at Gen1 speed by looking for a '1' value on RxElecIdle instead of looking for a '0' on RxValid. If the PHY fails to deassert the RxValid signal in Recovery.Speed or Loopback.Active (because of corrupted EIOS for example), then EI cannot be inferred successfully in the controller by just detecting the condition RxValid=0. Note: This register field is sticky.
20	RW	0x0	SEL_DEEMPHASIS Used to set the de-emphasis level for upstream ports. This bit selects the level of de-emphasis the link operates at. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W (sticky) Note: This register field is sticky.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
19	RW	0x0	CONFIG_TX_COMP_RX Config Tx Compliance Receive Bit. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W (sticky) Note: This register field is sticky.
18	RW	0x0	CONFIG_PHY_TX_CHANGE Config PHY Tx Swing. Controls the PHY transmitter voltage swing level. The controller drives the mac_phy_txswing output from this register bit field. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W (sticky) Note: This register field is sticky.
17	RW	0x0	DIRECT_SPEED_CHANGE Directed Speed Change. When the speed change occurs, the controller will clear the contents of this field; and a read to this field by your software will return a '0'. To manually initiate the speed change: - Write to LINK_CONTROL2_LINK_STATUS2_REG.PCIE_CAP_TARGET_LINK_SPEED in the local device - Deassert this field - Assert this field If you set the default of this field using the DEFAULT_GEN2_SPEED_CHANGE configuration parameter to '1', then the speed change is initiated automatically after link up, and the controller clears the contents of this field. If you want to prevent this automatic speed change, then write a lower speed value to the Target Link Speed field of the Link Control 2 register (LINK_CONTROL2_LINK_STATUS2_OFF.PCIE_CAP_TARGET_LINK_SPEED) through the DBI before link up. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W
16	RW	0x0	AUTO_LANE_FLIP_CTRL_EN Enable Auto flipping of the lanes. You must set the CX_AUTO_LANE_FLIP_CTRL_EN configuration parameter to include the hardware for this feature in the controller. For more details, see the 'Lane Reversal' appendix in the Databook. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W (sticky) Note: This register field is sticky.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
15:13	RW	0x0	PRE_DET_LANE Predetermined Lane for Auto Flip. This field defines which physical lane is connected to logical Lane0 by the flip operation performed in Detect. This field is used to restrict the receiver detect procedure to a particular lane when the default detect and polling procedure performed on all lanes cannot be successful. A notable example of when it is useful to program this field to a value different from the default, is when a lane is asymmetrically broken, that is, it is detected in Detect LTSSM state but it cannot exit Electrical Idle in Polling LTSSM state. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W (sticky) Note: This register field is sticky.
12:8	RW	0x01	NUM_OF_LANES Predetermined Number of Lanes. Defines the number of lanes which are connected and not bad. Used to limit the effective link width to ignore 'broken" or "unused" lanes that detect a receiver. Indicates the number of lanes to check for exit from Electrical Idle in Polling.Active and L2.Idle. It is possible that the LTSSM might detect a receiver on a bad or broken lane during the Detect Substate. However, it is also possible that such a lane might also fail to exit Electrical Idle and therefore prevent a valid link from being configured. This value is referred to as the "Predetermined Number of Lanes" in section 4.2.6.2.1 of the PCI Express Base Specification. When you have unused lanes in your system, then you must change the value in this register to reflect the number of lanes. You must also change the value in the "Link Mode Enable" field of PORT_LINK_CTRL_OFF. The value in this register is normally the same as the encoded value in PORT_LINK_CTRL_OFF. If you find that one of your used lanes is bad then you must reduce the value in this register. For more information, see "How to Tie Off Unused Lanes" in the Databook. For information on upsizing and downsizing the link width, see "Link Establishment" in the Databook. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W (sticky) Note: This register field is sticky.
7:0	RW	0xff	FAST_TRAINING_SEQ Sets the Number of Fast Training Sequences (N_FTS) that the controller advertises as its N_FTS during Gen2 or Gen3 link training. This value is used to inform the link partner about the PHY's ability to recover synchronization after a low power state. The number should be provided by the PHY vendor. Do not set N_FTS to zero; doing so can cause the LTSSM to go into the recovery state when exiting from L0s. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R/W (sticky) Note: This register field is sticky.

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	MSI_CTRL_INT_7_MASK MSI Interrupt7 Mask. Allows enabled interrupts to be masked. When an MSI is received for a masked interrupt, the corresponding status bit gets set in the interrupt status register but the msi_ctrl_int output is not set HIGH. Each bit corresponds to a single MSI Interrupt Vector. Note: This register field is sticky.

PCIE_DSP_PF0_PORT_LOGIC_MSI_CTRL_INT_7_STATUS_OFF

Address: Operational Base(0x00000700) + offset (0x0184)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	MSI_CTRL_INT_7_STATUS MSI Interrupt7 Status. When an MSI is detected for EP#i, one bit in this register is set. The decoding of the data payload of the MSI Memory Write request determines which bit gets set. A status is bit is cleared by writing a 1 to the bit. Each bit corresponds to a single MSI Interrupt Vector.

PCIE_DSP_PF0_PORT_LOGIC_MSI_GPIO_IO_OFF

Address: Operational Base(0x00000700) + offset (0x0188)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	MSI_GPIO_REG MSI GPIO Register. The contents of this register drive the top-level GPIO msi_ctrl_io[31:0]. Note: This register field is sticky.

PCIE_DSP_PF0_PORT_LOGIC_CLOCK_GATING_CTRL_OFF

Address: Operational Base(0x00000700) + offset (0x018C)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	RSVDP_2 Reserved for future use.
1	RW	0x1	AXI_CLK_GATING_EN AXI Clock Gating Enable. This register enables the AXI Bridge to autonomously enable and disable the AXI Master clock, the AXI Slave clock and the AXI DBI slave clock. The DWC_pcie_clk_rst.v module provides the gated clock, mstr_axi_aclk_gated, to the AXI Bridge and is enabled when the controllers clock enable signal, mstr_aclk_active, is asserted. For the AXI Slave this module provides the gated clock, slv_axi_aclk_gated, to the AXI Bridge and is enabled when the controllers clock enable signal, slv_aclk_active, is asserted. If the AXI DBI Slave is enabled (DBI_4SLAVE_POPULATED=1) the module provides the gated clock, dbi_axi_aclk_gated, to the AXI Bridge and is enabled when the controllers clock enable signal, dbi_aclk_active, is asserted. The controller de-asserts the clock enable signals when the respective AXI Master/Slave interfaces are idle. Note: This register field is sticky.

6:0	RW	0x01	RXSTANDBY_CONTROL Rxstandby Control. Bits 0..5 determine if the controller asserts the RxStandby signal (mac_phy_rxstandby) in the indicated condition. Bit 6 enables the controller to perform the RxStandby/RxStandbyStatus handshake. This field is reserved for internal use. You should not write to this field and change the default unless specifically instructed by Synopsys support. - [0]: Rx EIOS and subsequent T TX-IDLE-MIN - [1]: Rate Change - [2]: Inactive lane for upconfigure/downconfigure - [3]: PowerDown=P1orP2 - [4]: RxL0s.Idle - [5]: EI Infer in L0 - [6]: Execute RxStandby/RxStandbyStatus Handshake Note: This register field is sticky.

PCIE_DSP_PF0_PORT_LOGIC_TRGT_CPL_LUT_DELETE_ENTRY_OFF

Address: Operational Base(0x00000700) + offset (0x01C8)

Bit	Attr	Reset Value	Description
31	WO	0x0	DELETE_EN This is a one-shot bit. This is a self-clearing register field. Reading from this register field always returns a '0'.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
30:0	RW	0x00000000	LOOK_UP_ID This number selects one entry to delete of the TRGT_CPL_LUT.

PCIE_DSP_PF0_PORT_LOGIC_LINK_FLUSH_CONTROL_OFF

Address: Operational Base(0x00000700) + offset (0x01CC)

Bit	Attr	Reset Value	Description
31:24	RW	0xff	RSVD_I_8 This is an internally reserved field. Do not use. Note: This register field is sticky.
23:1	RO	0x000000	RSVDP_1 Reserved for future use.
0	RW	0x1	AUTO_FLUSH_EN Enables automatic flushing of pending requests before sending the reset request to the application logic to reset the PCIe controller and the AXI Bridge. The flushing process is initiated if any of the following events occur: - Hot reset request. A downstream port (DSP) can "hot reset" an upstream port (USP) by sending two consecutive TS1 ordered sets with the hot reset bit asserted. - Warm (Soft) reset request. Generated when exiting from D3 to D0 and cfg_pm_no_soft_rst=0. - Link down reset request. A high to low transition on smlh_req_rst_not indicates the link has gone down and the controller is requesting a reset. If you disable automatic flushing, your application is responsible for resetting the PCIe controller and the AXI Bridge. For more details see "Warm and Hot Resets" section in the Architecture chapter of the Databook. Note: This register field is sticky.

PCIE_DSP_PF0_PORT_LOGIC_AMBA_ERROR_RESPONSE_DEFAULT_OFF

Address: Operational Base(0x00000700) + offset (0x01D0)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	RSVDP_16 Reserved for future use.
15:10	RW	0x27	AMBA_ERROR_RESPONSE_MAP AXI Slave Response Error Map. Allows you to selectively map the errors received from the PCIe completion (for non-posted requests) to the AXI slave responses, slv_rresp or slv_bresp. The recommended setting is SLVERR. CRS is always mapped to OKAY. - [0] -- 0: UR (unsupported request) -> DECERR -- 1: UR (unsupported request) -> SLVERR - [1] -- 0: CRS (configuration retry status) -> DECERR -- 1: CRS (configuration retry status) -> SLVERR - [2] -- 0: CA (completer abort) -> DECERR -- 1: CA (completer abort) -> SLVERR - [3]: RESERVED (0x0) - [4]: RESERVED (0x0) - [5]

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
			-- 0: Completion Timeout -> DECERR -- 1: Completion Timeout -> SLVERR. The AXI bridge internally drops (processes internally but not passed to your application) a completion that has been marked by the Rx filter as UC or MLF, and does not pass its status directly down to the slave interface. It waits for a timeout and then signals "Completion Timeout" to the slave interface. The controller sets the AXI slave read databus to 0xFFFF for all error responses. Note: This register field is sticky.
9:5	RO	0x00	RSVDP_5 Reserved for future use.
4:3	RW	0x0	AMBA_ERROR_RESPONSE_CRS CRS Slave Error Response Mapping. Determines the AXI slave response for CRS completions. For more details see "Error Handling" in the AXI chapter of the Databook. Note: This register field is sticky.
2	RW	0x0	AMBA_ERROR_RESPONSE_VENDORID Vendor ID Non-existent Slave Error Response Mapping. Determines the AXI slave response for errors on reads to non-existent Vendor ID register. For more details see "Error Handling" in the AXI chapter of the Databook. Note: This register field is sticky.
1	RO	0x0	RSVDP_1 Reserved for future use.
0	RW	0x0	AMBA_ERROR_RESPONSE_GLOBAL Global Slave Error Response Mapping. Determines the AXI slave response for all error scenarios on non-posted requests. For more details see "Error Handling" in the AXI chapter of the Databook. The error response mapping is not applicable to Non-existent Vendor ID register reads. Note: This register field is sticky.

PCIE_DSP_PF0_PORT_LOGIC_AMBA_LINK_TIMEOUT_OFF

Address: Operational Base(0x00000700) + offset (0x01D4)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	RSVDP_9 Reserved for future use.
8	RW	0x0	LINK_TIMEOUT_ENABLE_DEFAULT Disable Flush. Note: This register field is sticky.
7:0	RW	0x32	LINK_TIMEOUT_PERIOD_DEFAULT Timeout Value (ms). The timer will timeout and then flush the bridge TX request queues after this amount of time. The timer counts when there are pending outbound AXI slave interface requests and the PCIe TX link is not transmitting any of these requests. The timer is clocked by core_clk. Note: This register field is sticky.

PCIE_DSP_PF0_PORT_LOGIC_AMBA_ORDERING_CTRL_OFF

Address: Operational Base(0x00000700) + offset (0x01D8)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	RSVDP_8 Reserved for future use.
7	RW	0x0	AX_MSTR_ZEROLREAD_FW AXI Master Zero Length Read Forward to the application. The DW PCIe controller AXI bridge is able to terminate in order with the Posted transactions the zero length read, implementing the PCIe express flush semantics of the Posted transactions.
6:5	RO	0x0	RSVDP_5 Reserved for future use.
4:3	RW	0x0	AX_MSTR_ORDR_P_EVENT_SEL AXI Master Posted Ordering Event Selector. This field selects how the master interface determines when a P write is completed when enforcing the PCIe ordering rule, "NP must not pass P" at the AXI Master Interface. The AXI protocol does not support ordering between channels. Therefore, NP reads can pass P on your AXI bus fabric. This can result in an ordering violation when the read overtakes a P that is going to the same address. Therefore, the bridge master does not issue any NP requests until all outstanding P writes reach their destination. It does this by waiting for the all of the write responses on the B channel. This can affect the performance of the master read channel. For scenarios where the interconnect serializes the AXI master "AW", "W" and "AR" channels,you can increase the performance by reducing the need to wait until the complete Posted transaction has effectively reached the application slave. Note: This setting will not affect: - MSI interrupt catcher and P data ordering. This is always driven by the B'last event. - DMA read engine TLP ordering. This is always driven by the B'last event. - NP write transactions which are always serialized with P write transactions.
2	RO	0x0	RSVDP_2 Reserved for future use.
1	RW	0x0	AX_SNP_EN AXI Serialize Non-Posted Requests Enable. This field enables the AXI Bridge to serialize same ID Non-Posted Read/Write Requests on the wire. Serialization implies one outstanding same ID NP Read or Write on the wire and used to avoid AXI RAR and WAW hazards at the remote link partner. For more details, see the "Optional Serialization of AXI Slave Non-posted Requests" section in the AXI chapter of the Databook.
0	RO	0x0	RSVDP_0 Reserved for future use.

PCIE_DSP_PF0_PORT_LOGIC_AUX_CLK_FREQ_OFF

Address: Operational Base(0x00000700) + offset (0x0440)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	RSVDP_10 Reserved for future use.
9:0	RW	0x018	AUX_CLK_FREQ The aux_clk frequency in MHz. This value is used to provide a 1 us reference for counting time during low-power states with aux_clk when the PHY has removed the pipe_clk. Frequencies lower than 1 MHz are possible but with a loss of accuracy in the time counted. If the actual frequency (f) of aux_clk does not exactly match the programmed frequency (f_prog), then there is an error in the time counted by the controller that can be expressed in percentage as: err% = (f_prog/f-1)*100. For example if f=2.5 MHz and f_prog=3 MHz, then err% =(3/2.5-1)*100 =20%, meaning that the time counted by the controller on aux_clk will be 20% greater than the time in us programmed in the corresponding time register (for example T_POWER_ON). Note: This register field is sticky.

14.4.3.11 PCIE_DSP_PF0_PCIE_CAP_DBI2 Register Description

14.4.3.11.1 Registers Summary

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_PCIE_CAP_DBI2_SHADOW_LINK_CAPABILITIES_REG	0x000C	W	0x0073EC13	This is a 7-bit register at the same address as LINK_CAPABILITIES_REG, and it only exists when one or more of the following expressions are true: - CX_NFTS !=CX_COMM_NFTS - DEFAULT_L0S_EXIT_LATENCY !=DEFAULT_COMM_L0S_EXIT_LATENCY - DEFAULT_L1_EXIT_LATENCY !=DEFAULT_COMM_L1_EXIT_LATENCYThe register has only two fields in RTL. All of the other fields here do not exist in RTL and accesses to them are redirected to the corresponding fields in the parent register (LINK_CAPABILITIES_REG).They are modeled here to make the shadow register (model) 32 bits wide which is a tool requirement.

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

14.4.3.11.2 Detail Registers Description

PCIE_DSP_PF0_PCIE_CAP_DBI2_SHADOW_LINK_CAPABILITIES_REG

Address: Operational Base(0x00100000) + offset (0x000C)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	PCIE_CAP_PORT_NUM Shadow Port Number. This field indicates the PCI Express Port number for the given PCI Express Link. Multi-Function Devices associated with an Upstream Port must report the same value in this field for all functions. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
23	RO	0x0	RSVDP_23 Reserved for future use.
22	RO	0x1	PCIE_CAP_ASPM_OPT_COMPLIANCE Shadow ASPM Optionality Compliance. This field must be set to 1b in all functions. Components implemented against certain earlier versions of this specification will have this bit set to 0b. Software is permitted to use the value of this bit to help determine whether to enable ASPM or whether to run ASPM compliance tests. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R
21	RO	0x1	PCIE_CAP_LINK_BW_NOT_CAP Shadow Link Bandwidth Notification Capable. A value of 1b indicates support for the Link Bandwidth Notification status and interrupt mechanisms. This capability is required for all Root Ports and Switch Downstream Ports supporting Links wider than x1 and/or multiple Link speeds. This field is not applicable and is Reserved for Endpoints, PCI Express to PCI/PCI-X bridges, and Upstream Ports of Switches. For functions that do not implement the Link Bandwidth Notification Capability the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
20	RO	0x1	PCIE_CAP_DLL_ACTIVE_REP_CAP Shadow Data Link Layer Link Active Reporting Capable. For a Downstream Port, the controller hardwires this bit to 1b if the component supports the optional capability of reporting the DL_Active state of the Data Link Control and Management State Machine. For a hot-plug capable Downstream Port (as indicated by the Hot-Plug Capable bit of the Slot Capabilities register) or a Downstream Port that supports Link speeds greater than 5.0 GT/s, the controller hardwires this bit to 1b. For Upstream Ports and components that do not support this optional capability, the controller hardwires this bit to 0b.
19	RO	0x0	PCIE_CAP_SURPRISE_DOWN_ERR_REP_CAP Shadow Surprise Down Error Reporting Capable. For a Downstream Port, this bit must be set if the component supports the optional capability of detecting and reporting a Surprise Down error condition. For Upstream Ports and components that do not support this optional capability, the controller hardwires this bit to 0b. Note: This register field is sticky.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
18	RO	0x0	PCIE_CAP_CLOCK_POWER_MAN Shadow Clock Power Management. For Upstream Ports, a value of 1b in this bit indicates that the component tolerates the removal of any reference clock(s) via the "clock request" (CLKREQ#) mechanism when the Link is in the L1 and L2/L3 Ready Link states. A value of 0b indicates the component does not have this capability and that reference clock(s) must not be removed in these Link states. L1 PM Substates defines other semantics for the CLKREQ# signal, which are managed independently of Clock Power Management. This Capability is applicable only in form factors that support "clock request" (CLKREQ#) capability. For a Multi-Function device associated with an Upstream Port, each Function indicates its capability independently. Power Management configuration software must only permit reference clock removal if all functions of the Multi-Function device indicate a 1b in this bit. For ARI Devices, all Functions must indicate the same value in this bit. For Downstream Ports, the controller hardwires this bit to 0b. Note: This register field is sticky.
17:15	RO	0x7	SHADOW_PCIE_CAP_L1_EXIT_LATENCY Shadow L1 Exit Latency. There are two each of these register fields, this one and a shadow one at the same address. The Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG) determines which one is used by the controller and which one is accessed by a read request. Common Clock operation is supported (possible) in the controller when one or more of the following expressions is true: - CX_NFTS !=CX_COMM_NFTS - DEFAULT_L0S_EXIT_LATENCY !=DEFAULT_COMM_L0S_EXIT_LATENCY - DEFAULT_L1_EXIT_LATENCY !=DEFAULT_COMM_L1_EXIT_LATENCY Common Clock operation is enabled in the controller when you set the Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG). The assertion of CS2 (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) is required to write to the shadow field at this location. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R - Dbi2: R/W

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
14:12	RO	0x6	SHADOW_PCIE_CAP_L0S_EXIT_LATENCY Shadow L0s Exit Latency. There are two each of these register fields, this one and a shadow one at the same address. The Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG) determines which one is used by the controller and which one is accessed by a read request. Common Clock operation is supported (possible) in the controller when one or more of the following expressions is true: - CX_NFTS !=CX_COMM_NFTS - DEFAULT_L0S_EXIT_LATENCY !=DEFAULT_COMM_L0S_EXIT_LATENCY - DEFAULT_L1_EXIT_LATENCY !=DEFAULT_COMM_L1_EXIT_LATENCY Common Clock operation is enabled in the controller when you set the Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG). The assertion of CS2 (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) is required to write to the shadow field at this location. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: R - Dbi2: R/W
11:10	RO	0x3	PCIE_CAP_ACTIVE_STATE_LINK_PM_SUPPORT Shadow Level of ASPM (Active State Power Management) Support. This field indicates the level of ASPM supported on the given PCI Express Link. For more details on ASPM support requirements, see section 5.4.1 of PCI Express Base Specification. Multi-Function devices associated with an Upstream Port must report the same value in this field for all functions. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
9:4	RO	0x01	PCIE_CAP_MAX_LINK_WIDTH Shadow Maximum Link Width. This field indicates the maximum Link width (xN - corresponding to N Lanes) implemented by the component. This value is permitted to exceed the number of Lanes routed to the slot (Downstream Port), adapter connector (Upstream Port), or in the case of component-to-component connections, the actual wired connection width. All encodings other than the defined encodings are reserved. Multi-Function devices associated with an Upstream Port must report the same value in this field for all functions. In M-PCIe mode, the reset and dynamic values of this field are calculated by the controller. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
3:0	RO	0x3	PCIE_CAP_MAX_LINK_SPEED Shadow Maximum Link Speed. This field indicates the maximum Link speed of the associated Port. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the maximum Link speed. All encodings other than the defined encodings are reserved. Multi-Function Devices associated with an Upstream Port must report the same value in this field for all functions. In M-PCIe mode, the reset and dynamic values of this field are calculated by the controller. Note: The access attributes of this field are as follows: - Wire: No access. - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.

14.4.3.12 PCIE_DSP_PF0_MSIX_CAP_DBI2 Register Description

14.4.3.12.1 Registers Summary

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_MSIX_CAP_DBI2_SHADOW_PCI_MSIX_CAP_ID_NEXT_CTRL_REG	0x0000	W	0x00000000	This is the shadow register of the MSI-X Capability ID, Next Pointer, and Control Register.
PCIE_DSP_PF0_MSIX_CAP_DBI2_SHADOW_MSIX_TABLE_OFFSET_REG	0x0004	W	0x00000000	This register provides Table BIR and MSI-x Table offset select.
PCIE_DSP_PF0_MSIX_CAP_DBI2_SHADOW_MSIX_PBA_OFFSET_REG	0x0008	W	0x00000010	This register provides PBA Offset and PBA BIR value.

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-*

Double WORD (64 bits) access

14.4.3.12.2 Detail Registers Description

PCIE_DSP_PF0_MSIX_CAP_DBI2_SHADOW_PCI_MSIX_CAP_ID_NEXT_CTRL_REG

Address: Operational Base(0x001000B0) + offset (0x0000)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	PCI_MSIX_RESERVED1 reserved field 1 in the shadow register. Note: This register field is sticky.
26:16	RO	0x000	PCI_MSIX_TABLE_SIZE MSI-X Table Size in the shadow register. Note: The access attributes of this field are as follows: - Wire: No access - Dbi: No access - Dbi2: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
15:0	RO	0x0000	PCI_MSIX_RESERVED0 reserved field 0 in the shadow register. Note: This register field is sticky.

PCIE_DSP_PF0_MSIX_CAP_DBI2_SHADOW_MSIX_TABLE_OFFSET_REG

Address: Operational Base(0x001000B0) + offset (0x0004)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	PCI_MSIX_TABLE_OFFSET MSI-X Table Offset. Used as an offset from the address contained by one of the Function's Base Address Registers to point to the base of the MSI-X Table. The lower 3 Table BIR bits are masked off (set to zero) by software to form a 32-bit QWORD-aligned offset. Note: The access attributes of this field are as follows: - Wire: No access - Dbi: No access - Dbi2: if (DBI_RO_WR_EN == 1 && MSIX_CAP_ENABLE=1) then R/W else R Note: This register field is sticky.
2:0	RO	0x0	PCI_MSIX_BIR MSI-X Table BAR Indicator Register Field. This field indicates which one of a Function's Base Address Registers , located beginning at 10h in Configuration Space, or entry in the Enhanced Allocation capability with a matching BEI , is used to map the Function's MSI-X Table into Memory Space. All encodings other than the defined encodings are reserved. For a 64-bit Base Address Register , the Table BIR indicates the lower DWORD. For Functions with Type 1 Configuration Space headers, BIR values 2 through 5 are also Reserved. Note: The access attributes of this field are as follows: - Wire: No access - Dbi: No access - Dbi2: if (DBI_RO_WR_EN == 1 && MSIX_CAP_ENABLE=1) then R/W else R Note: This register field is sticky.

PCIE_DSP_PF0_MSIX_CAP_DBI2_SHADOW_MSIX_PBA_OFFSET_REG

Address: Operational Base(0x001000B0) + offset (0x0008)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000002	PCI_MSIX_PBA_OFFSET MSI-X PBA Offset. Used as an offset from the address contained by one of the Function's Base Address Registers to point to the base of the MSI-X PBA. The lower 3 PBA BIR bits are masked off (set to zero) by software to form a 32-bit QWORD-aligned offset. Note: The access attributes of this field are as follows: - Wire: No access - Dbi: No access - Dbi2: if (DBI_RO_WR_EN == 1 && MSIX_CAP_ENABLE=1) then R/W else R Note: This register field is sticky.
2:0	RO	0x0	PCI_MSIX_PBA_BIR MSI-X PBA BIR. This field indicates which one of a Function's Base Address Registers , located beginning at 10h in Configuration Space, or entry in the Enhanced Allocation capability with a matching BEI, is used to map the Function's MSI-X PBA into Memory Space. The PBA BIR value definitions are identical to those for the Table BIR . Note: The access attributes of this field are as follows: - Wire: No access - Dbi: No access - Dbi2: if (DBI_RO_WR_EN == 1 && MSIX_CAP_ENABLE=1) then R/W else R Note: This register field is sticky.

14.4.3.13 PCIE_DSP_PF0_ATU_CAP Register Description

14.4.3.13.1 Registers Summary

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_ATU_CAP_IATU_REGION_CTRL_1_OFF_OUTBOUND_0	0x0000	W	0x00000000	This register controls the iATU outbound region access based on the optional iATU outbound features enabled using iATU Region Control 2 Register.
PCIE_DSP_PF0_ATU_CAP_IATU_REGION_CTRL_2_OFF_OUTBOUND_0	0x0004	W	0x00000000	Using this register you can enable/disable the outbound iATU optional features.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Name	Offset	Size	Reset Value	Description
PCIE_DSP_PF0_ATU_CAP_IATU_LWR_BASE_ADDR_OFF_OUTBOUND_0	0x0008	W	0x00000000	The CX_ATU_MIN_REGION_SIZE configuration parameter (Value Range: 4 kB, 8 kB, 16 kB, 32 kB, 64 kB defaults to 64 kB) specifies the minimum size of an address translation region. For example, if set to 64 kB; the lower 16 bits of the Base, Limit and Target registers are zero and all address regions are aligned on 64 kB boundaries. More precisely, the lower log2(CX_ATU_MIN_REGION_SIZE) bits are zero.
PCIE_DSP_PF0_ATU_CAP_IATU_UPPER_BASE_ADDR_OFF_OUTBOUND_0	0x000C	W	0x00000000	This register holds the upper 32-bits of the start (and end) address of the address region to be translated.
PCIE_DSP_PF0_ATU_CAP_IATU_LIMIT_ADDR_OFF_OUTBOUND_0	0x0010	W	0x0000FFFF	This register holds the end address of the address region to be translated.
PCIE_DSP_PF0_ATU_CAP_IATU_LWR_TARGET_ADDR_OFF_OUTBOUND_0	0x0014	W	0x00000000	This register holds the Lower Target part of the new address of the translated region, or the outbound TLP header information, depending on the setting of HEADER_SUBSTITUTE_EN field of IATU_REGION_CTRL_2_VIEWPORT_OFF_OUTBOUND_i register.
PCIE_DSP_PF0_ATU_CAP_IATU_UPPER_TARGET_ADDR_OFF_OUTBOUND_0	0x0018	W	0x00000000	This register holds the upper 32 bits of the start address (Upper Target part) of the new address of the translated region.
PCIE_DSP_PF0_ATU_CAP_IATU_UPPR_LIMIT_ADDR_OFF_OUTBOUND_0	0x0020	W	0x00000000	The CX_MAX_ATU_REGION_SIZE configuration parameter (Value Range: 0->32, 8=1TB) specifies the maximum region size of an address translation region. This register is only used when the INCREASE_REGION_SIZE field in IATU_REGION_CTRL_1_OFF_OUTBOUND_i is '1'.
PCIE_DSP_PF0_ATU_CAP_IATU_REGION_CTRL_1_OFF_INBOUND_0	0x0100	W	0x00000000	This register controls the iATU inbound region access based on the optional iATU inbound features enabled using iATU Region Control 2 Register.
PCIE_DSP_PF0_ATU_CAP_IATU_REGION_CTRL_2_OFF_INBOUND_0	0x0104	W	0x00000000	Using this register you can enable/disable the inbound iATU optional features.
