Technical Reference Manual
(Part 2)

Revision 1.2
June 2024

Copyright © 2024 Rockchip Electronics Co., Ltd.

Revision History

Date	Revision	Description
2024-06-24	1.2	Reorganize the order of chapters; Update the following chapters: RGA, VOP, DPTX Controller, HDMI TX Controller, HDMI/Edp Combo PHY, UFS
2024-04-02	1.1	Update the PWM, VOP, RGA chapters
2024-03-18	1.0	Initial Release

Table of Content

Table of Content 3
Figure Index 7
Table Index 11
Warranty Disclaimer 13
Chapter 1 JPEG 14
1.1 Overview 14
1.2 Block Diagram 14
1.3 Function Description 15
1.4 Register Description 18
1.5 Application Notes 54
Chapter 2 Video Display Post Processor (VDPP) 59
2.1 Overview 59
2.2 Block Diagram 60
2.3 Function Description 61
2.4 Register Description 62
2.5 Application Notes 209
CHAPTER 3 Video Processing Sub-System (VPSS) 213
3.1 Introduction 213
3.2 Block Diagram 214
3.3 Function Description 215
3.4 Register Description 216
3.5 Application Notes 387
Chapter 4 Raster Graphic Acceleration (RGA2.5) 391
4.1 Overview 391
4.2 Block Diagram 392
4.3 Function Description 394
4.4 Register Description 397
4.5 Application Notes 429
Chapter 5 DECOM 431
5.1 Overview 431
5.2 Block Diagram 431
5.3 Function Description 431
5.4 Register Description 433
5.5 Application Notes 442
Chapter 6 Video Capture (VICAP) 443
6.1 Overview 443
6.2 Block Diagram 443
6.3 Function Description 444
6.4 Register Description 450
6.5 Registers Summary 451
6.6 Interface Description 581
6.7 Application Notes 582
Chapter 7 Dynamic Memory Interface (DMC) 587
7.1 Overview 587
7.2 Block Diagram 588
7.3 Function Description 588
7.4 Register Description 591
7.5 Interface Description 1067
7.6 Application Notes 1069

Chapter 8 Gigabit Media Access Controller (GMAC) 1093

8.1 Overview 1093
8.2 Block Diagram 1096
8.3 Function Description 1097
8.4 Register Description 1102
8.5 Interface Description 1309
8.6 Application Note 1315

Chapter 9 Process-Voltage-Temperature Monitor (PVTM) 1342

9.1 Overview 1342
9.2 Block Diagram 1342
9.3 Function Description 1342
9.4 Register Description 1343
9.5 Application Notes 1347

Chapter 10 PVTPLL 1349

10.1 Overview 1349
10.2 Block Diagram 1349
10.3 Function Description 1350
10.4 RegisterDescription 1350
10.5 Application Notes 1355

Chapter 11 Video Output Processor (VOP) 1357

11.1 Overview 1357
11.2 Block Diagram 1361
11.3 Operating Mode 1362
11.4 Function Description 1372
11.5 Register Description 1397
11.6 Application Notes 1687

Chapter 12 EBC 1688

12.1 Overview 1688
12.2 Block Diagram 1689
12.3 Function Description 1689
12.4 Register Description 1699
12.5 Interface Description 1718
12.6 Application Notes 1723

Chapter 13 USB3.0 Controller 1727

13.1 Overview 1727
13.2 Block Diagram 1728
13.3 Function Description 1728
13.4 Register Description 1728
13.5 Application Notes 1769

Chapter 14 PCIe Controller 1772

14.1 Overview 1772
14.2 Block Diagram 1772
14.3 Function Description 1773
14.4 Register Description 1775
14.5 Interface Description 2191
14.6 Application Notes 2192
14.7 Appendix 2210

Chapter 15 USBDP COMBO PHY 2211

15.1 Overview 2211
15.2 Block Diagram 2211
15.3 Function Description 2211

Copyright © 2024 Rockchip Electronics Co., Ltd.

15.4 Register Description 2213
15.5 Application Notes 2252
Chapter 16 SATA Host 2261
16.1 Overview 2261
16.2 Block Diagram 2261
16.3 Function Description 2261
16.4 Register Description 2263
16.5 Interface Description 2300
16.6 Application Notes 2301
Chapter 17 Multiple Protocol PHY 2307
17.1 Overview 2307
17.2 Block Diagram 2308
17.3 Function Description 2310
17.4 Register Description 2310
17.5 Interface Description 2333
17.6 Application Notes 2333
Chapter 18 MIPI DSI-2 Host Controller 2336
18.1 Overview 2336
18.2 Features 2336
18.3 Function Description 2337
18.4 Register Description 2343
Chapter 19 MIPI CSI HOST 2370
19.1 Overview 2370
19.2 Block Diagram 2370
19.3 Function Description 2370
19.4 Register Description 2372
19.5 Application Notes 2379
Chapter 20 MIPI CSI DPHY 2381
20.1 Overview 2381
20.2 Block Diagram 2381
20.3 Register Description 2381
20.4 Application Notes 2395
Chapter 21 MIPI D-PHY / C-PHY Combo PHY 2397
21.1 Overview 2397
21.2 Block Diagram 2397
21.3 Function Description 2398
21.4 Register Description 2400
21.5 Interface Description 2474
21.6 Application Notes 2475
Chapter 22 DisplayPort Transmitter Controller (DPTX) 2480
22.1 Overview 2480
22.2 Features 2480
22.3 Function Description 2480
22.4 Register Description 2487
22.5 Interface Description 2551
22.6 Application Notes 2551
Chapter 23 EDP TX Controller 2561
23.1 Overview 2561
23.2 Block Diagram 2561
23.3 Function Description 2561
23.4 Register Description 2562

23.5 Interface Description 2611
23.6 Application Notes 2611
Chapter 24 HDMI TX Controller 2630
24.1 Overview 2630
24.2 Block Diagram 2631
24.3 Function Description 2631
24.4 Register Description 2634
24.5 Interface Description 2832
24.6 Application Notes 2832
Chapter 25 HDMI TX/eDP Combo PHY 2840
25.1 Overview 2840
25.2 Block Diagram 2841
25.3 Function Description 2841
25.4 Register Description 2843
25.5 Interface Description 2900
25.6 Application Notes 2901
Chapter 26 UFS 2925
26.1 Overview 2925
26.2 Block Diagram 2925
26.3 Function Description 2925
26.4 Register Description 2927
26.5 UFS_GRF Register Description 2960
26.6 Interface Description 2962
26.7 Application Notes 2962

Chapter 1 JPEG

1.1 Overview

The JPEG codec provides a hardware-accelerated solution for processing JPEG-compressed images, including a decoder and an encoder. The capabilities of the codec are listed below:

- JPEG encoder
  - Supports Baseline(DCT sequential)
  - Supports JPEG file interchange format (JFIF) 1.02
  - Supports image size is from 16x16 to 65520x65520
  - Supports YUV400/YUV420/YUV422/YUV444
  - Supports low delay input and low delay output
  - Supports Ultra fast encoder
  - Supports enhance link mode
  - Supports ecs split
- JPEG decoder
  - Supports Baseline(DCT sequential)
  - Supports JPEG file interchange format (JFIF) 1.02
  - Supports image size is from 48x48 to 65520x65520
  - Supports YUV400/YUV420/YUV422/YUV440/YUV411/YUV444
  - Supports low delay input and low delay output
  - Supports Ultra fast decoder
  - Supports enhance link mode

1.2 Block Diagram

As shown in the figures below, the CPU can access the JPEC codec register bank via the AHB bus. Bit stream and other necessary data stored in DDR are fed into the codec via the AXI read channel, and when the coding processing is complete, the output is written to the designated DDR region via the AXI write channel.

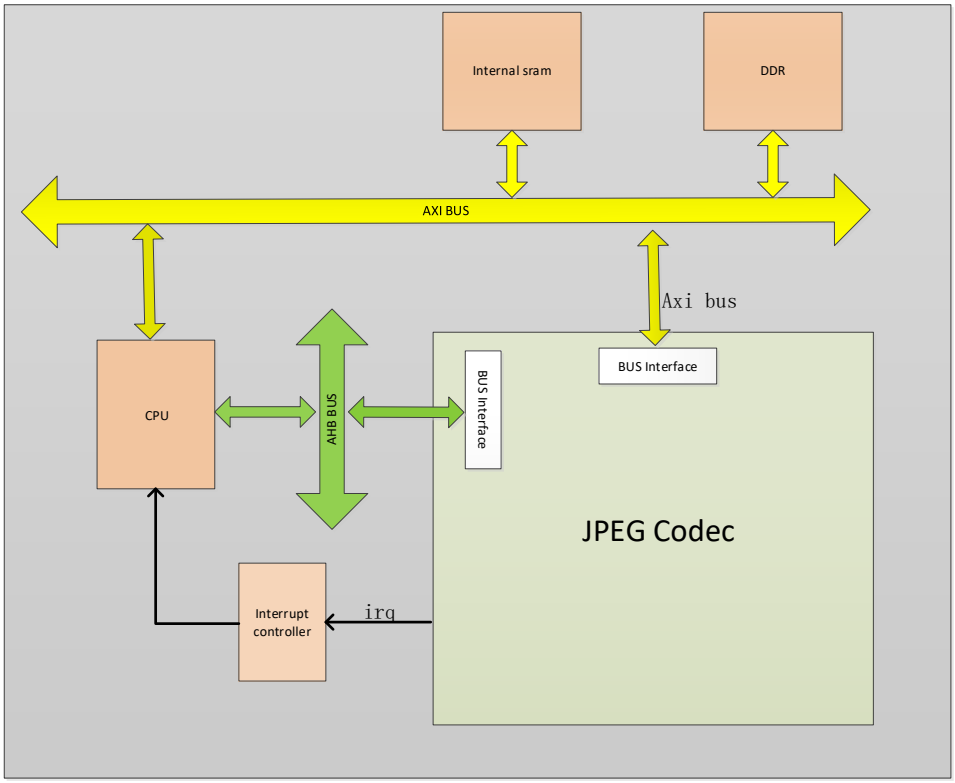

Fig. 1-1 JPEG codec Block Diagram

1.3 Function Description

1.3.1 MMU

The MMU divides memory into 4KB pages, where each page can be individually configured. For each page the following parameters are specified:

- Address translation of virtual memory, this enables the processor to work using address that differ from the physical address in the memory system.
- The permitted types of accesses to that page. Each page can permit read, write, both, or none.

The MMU use 2-level page table structure:

1. The first level, the page directory consists of 1024 directory table entries (DTEs), each pointing to a page table.
2. The second level, the page table consists of 1024 page table entries (PTEs), each pointing to a page in memory.

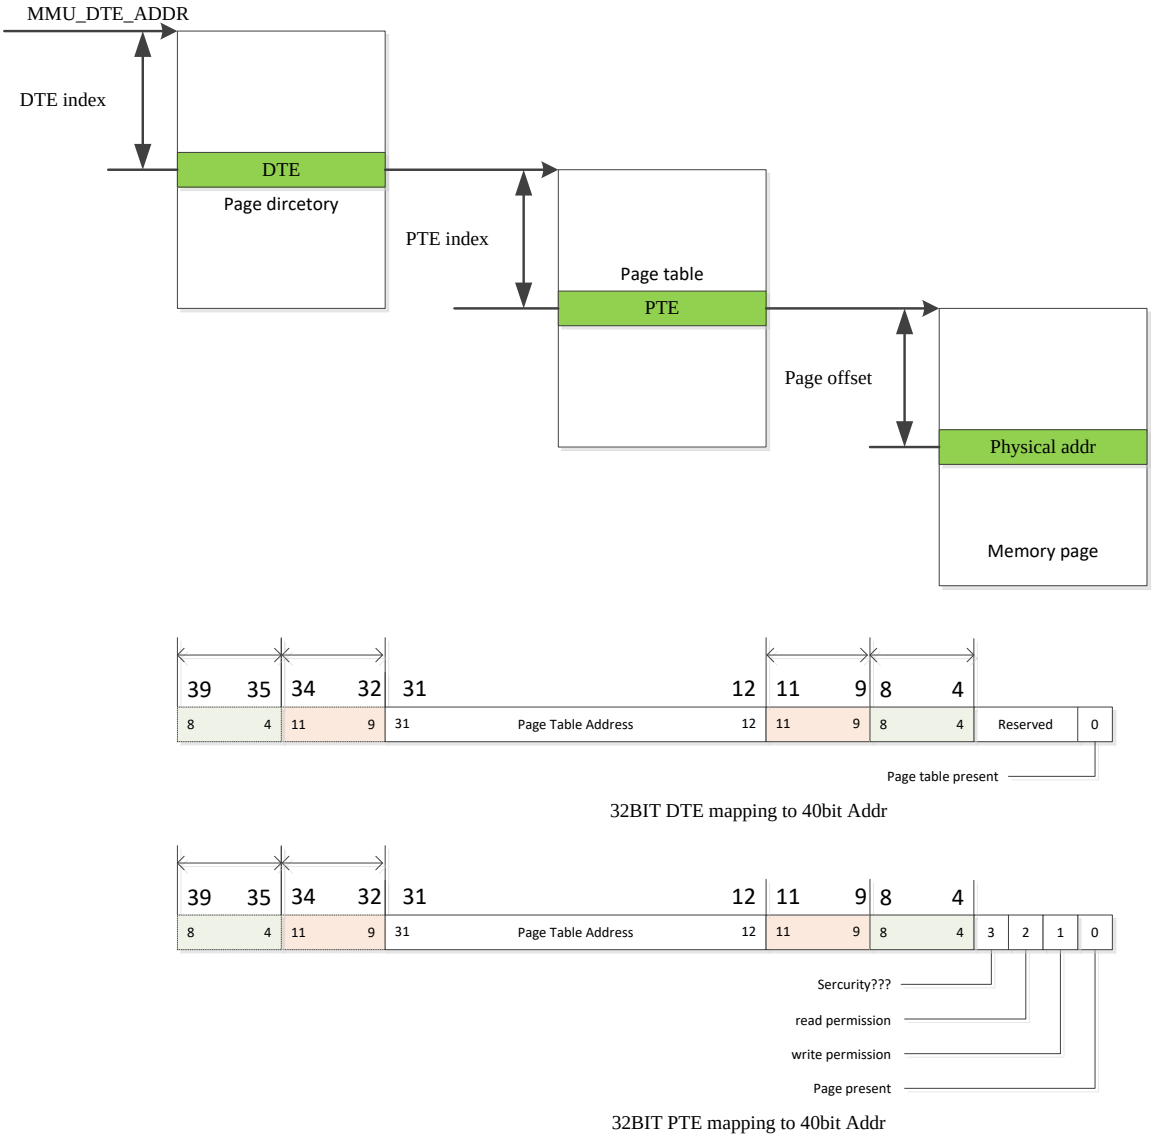

Fig. 1-2 structure of two-level page table

1.3.2 JPEG Decoder Feature

JPEG features supported by decoder are as shown in Table 1-1 JPEG features.

Table 1-1 JPEG features

Feature	Decoder support
Input data format	JFIF file format 1.02

Feature	Decoder support
	YCbCr 4:0:0, 4:2:0, 4:2:2, 4:4:0, 4:1:1 and 4:4:4 semi-planar
Decoding scheme	frame by frame
Output data format	YCbCr 4:0:0, 4:2:0, 4:2:2, 4:4:0, 4:1:1 and 4:4:4 semi-planar, tile4x4
Supported image size	48x48 to 65520x65520 Step size 8 pixels
Maximum frame rate	Up to 240 million pixels pre second
Thumbnail decoding	JPEG compressed thumbnails supported
Restart marker frequency decoding	Supported
MJPEG	Supported
Error detection	Supported

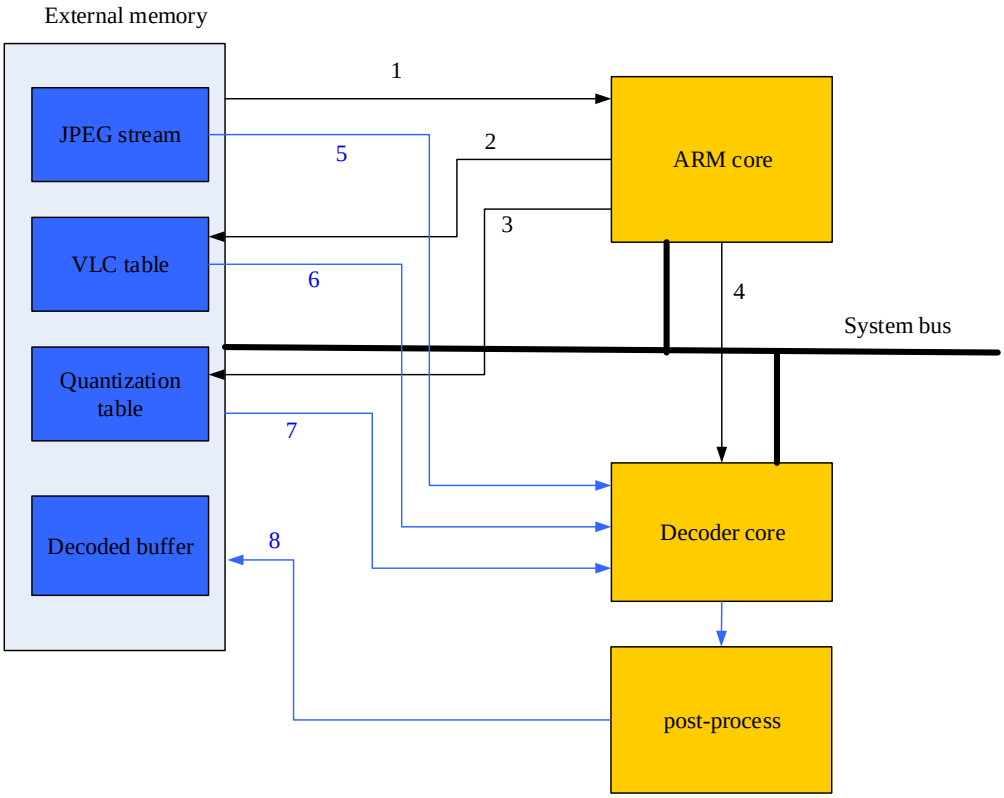

Fig. 1-3 The dataflow of JPEG decoder and post-processor

The data flow of JPEG decoder is as Fig. 1-8 shown. The decoder software starts decoding the picture by parsing the stream headers (1) and then writes the following items to external memory:
VLC tables (2)
Quantization tables (3)
Last step for the software is to write the hardware control registers and to enable the hardware (4). After starting hardware, SW waits interrupt from HW.
Hardware decodes the picture by reading stream (5), VLC (6) and QP (7) tables. Hardware writes the decoded output picture memory one macro block at a time (8). When the picture has been fully decoded, or the hardware has run out of stream data, it gives an interrupt with a proper status flag and provides stream end address for software to continue and returns to initial state.
The follow image post-processor only support combined mode.

The features supported by Post-processor are as show in Table 1-2 Post-processor features.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Table 1-2 Post-processor features

Feature	Post-processor support
Input data format	Any format generated by the decoder in combined mode YCbCr 4:2:0 semi-planar YCbCr 4:2:0 planar YCbYCr 4:2:2 YCrYCb 4:2:2 CbYCrY 4:2:2 CrYCbY 4:2:2
Post-processor scheme	Frame by frame. Post-processor handles the image macroblock by macroblock.
Input image source	Internal source
Output data format	YCbCr 4:2:0 semi-planar YCbCr 4:2:2 YCrYCb 4:2:2 CbYCrY 4:2:2 CrYCbY 4:2:2
Input image size	48x48 to 65520x65520 Step size 8 pixels
Output image size	16x16 to 65520x65520 Horizontal step size 1 Vertical step size 1
Image down-scaling	Proprietary averaging filter Arbitrary, integer scaling ratio separately for both dimensions 0/2/4/8 down-scaling ratio
Output picture	support raster or tile mode picture out luma 4x4 block tile

In pipe-line mode, the post-processor works together with the multi-format decoder. The PP will take its input directly from the decoder. The dataflow is as Fig. 1-4 show.

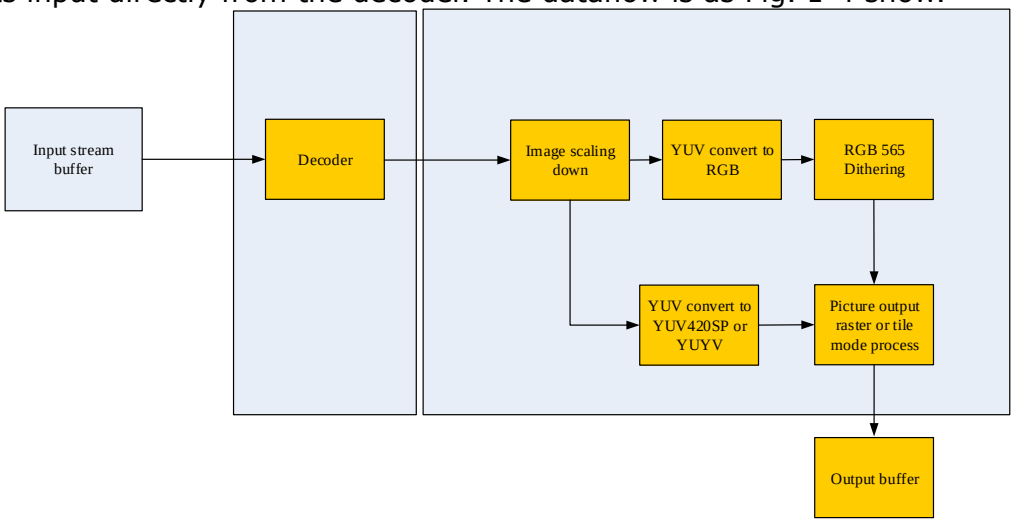

Fig. 1-4 Post-process Dataflow

1.3.3 JPEG Encoder Feature

The JPEG features supported by encoder are shown as follows.

Table 1-3 Video JPEG encoder feature

Feature	Encoder support
Input data format	YUV400 YUV420 planar

Copyright © 2024 Rockchip Electronics Co., Ltd.

Feature	Encoder support
	YUV420 semi-planar YUV422 YUV422 Interleaved YUYV422 UYVY422 YUV444 planar YUV444 semi-planar Tile4x4
Output data format	JFIF FILE format 1.02 YCbCr 4:0:0, 4:2:0, 4:2:2 and 4:4:4
Supported image size	16x16 to 65520x65520 Step size 8 pixels
Maximum Data rate	Up to 2.9 pixels per cycle

JPEG encoder supports 2 work modes: Register Configuration Mode and Link Table Mode.
In Register Configuration Mode, encoding a frame needs to be divided into three steps: Configure encoding parameters, start encoding, and then wait for encoding finish. Configuration register and interrupt response time will reduce the encoding speed, but software can adjust the configuration of the next frame in real time according to the encoding result of the previous frame.
In Link Table Mode, User can store several frames' configurations in DDR before encoding or add new frames to be encoded while VEPU is processing the previous one. This will save the time of interrupt response and register configuration and let VEPU and software process in parallel.

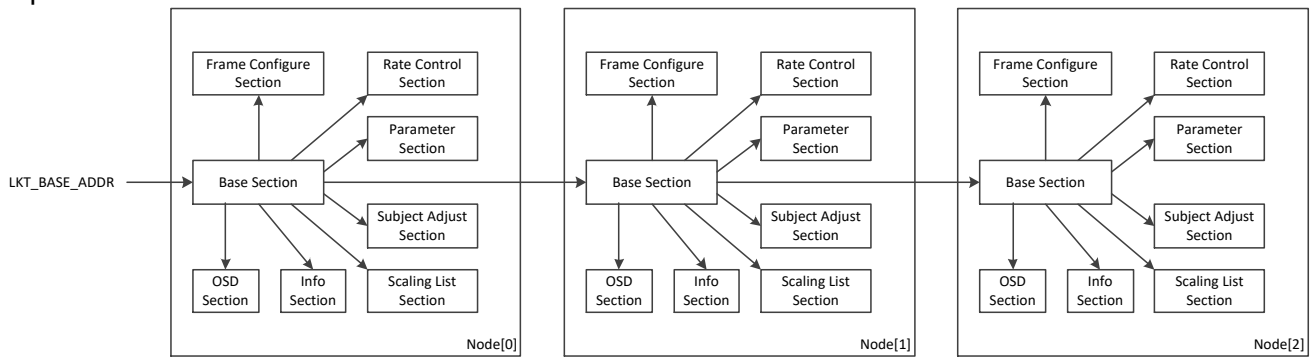

Fig. 1-2 VEPU Link Table Mode

All the configurations for each frame encoding are organized into a Node, and the configurations in each Node are classified into 6 sections:

- Base Section: Contains the information of other sections for current Node and Base Section of the next node, including whether it is valid and the starting address.
- Frame Configure Section: Contains the base frame configurations.
- Rate Control Section: Contains the configurations for Rate Control.
- Parameter Section: Contains the configurations of optional parameters.
- Subjective Adjust Section: Contains the configurations for subjective Quality Adjustment.
- Scaling List Section: Contains the configurations for User Defined HEVC/H.264 Scaling List and JPEG Quantization Table.
- Info Section: Contains the encoding information sent out by VEPU.

1.4 Register Description

1.4.1 Internal Address Mapping

The register address of JPEG codec is divided into three part:

- JPEG Decoder, whose offset is 0x0000
- JPEG Encoder, whose offset is 0x0800
- MMU, whose offset is 0x0F00

23	RW	0x0	sw_lkt_data_error_sta when high, an error is found in link cfg data
22	RW	0x0	sw_lkt_error_stop_sta when high, an error is found and stop decoder in link mode

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
21	RW	0x0	sw_lkt_node_stop_sta when high, complete the response to force stop cmd in link mode
20	RW	0x0	sw_lkt_force_stop_sta when high, an task is finish and stop decoder in link mode
19	RW	0x0	sw_lkt_mode_int_sta when this bit is high, has decoded a link task with node_int enable
18	RW	0x0	sw_lkt_opertaion_error_sta when this bit is high, an error is found in link cmd opertaion
17	RW	0x0	sw_low_delay_out_sta when this bit is high, the output picture pixel line is big then sw_low_delay_output
16	RW	0x0	sw_care_strm_error_e use for sw_error_prc_mode=1 0:not care stream error,when sw_care_strm_error_e=0, sw_dec_error_sta will not valid, mmu will not be reset at frame end, link table mode will continue without care stream error, only active error info registers; 1:care stream error;
15	RW	0x0	sw_buf_empty_force_end_flag 0:invalid 1:valid buffer empty interrupt with stream real empty so should force hardware decoder current frame end
14	RW	0x0	sw_softreset_rdy when it is 1'b1, it says that softreset has been done
13	RW	0x0	sw_dec_buf_empty_sta buffer empty status, only when sw_buf_empty_e is 1'b1 , this bit is valid software should clean stream buffer empty state and set sw_buf_empty_reload_p enbale at the same time
12	RW	0x0	sw_dec_timeout_sta When high the decoder has been idling for too long. it will self reset the hardware.only when sw_dec_timeout_e is 1'b1, this bit is valid
11	RW	0x0	sw_dec_error_sta when high, an error is found in input data stream decoding.when sw_error_prc_mode is 1'b0, it will self reset the hardware, otherwise it will not
10	RW	0x0	sw_dec_bus_sta When this bit is high, there is error on the axi bus, it will self reset hardware
9	RW	0x0	sw_dec_rdy_sta when this bit is high, decoder has decoded a picture (the output module send out a frame rdy)
8	RW	0x0	sw_dec_irq when high, decoder requests an interrupt. sw_dec_irq = sw_dec_irq_raw && (sw_dec_irq_dis == 1'b0)
7	RW	0x0	sw_wait_reset_e the enable flag of wait software system to reset flag 0: hardware will auto reset when error occur 1: wait software process reset when error occur

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
6	RW	0x0	sw_dec_irq_raw the raw status of sw_dec_irq,SW should reset this bit after interrupt is handled
5	RW	0x0	sw_softrst_en_p softreset enable signal write 1 to soft reset, write 0 invalid puls register
4	RW	0x0	sw_buf_empty_reload_p buffer empty stream reload enable signal write 1 to reload stream data ready pulse register with hardware auto clean valid at next cycle before reload enable,strm_len register should be reset and start_of_type is zero sw_strm_base addr may be reset also. note:sw_error_prc_mode should be set to 1 when sw_buf_empty_e valid otherwise the hardware would be reset and not support buffer buffer empty reload
3	RW	0x0	sw_buf_empty_e buffer empty interrupt enable
2	RW	0x0	sw_dec_timeout_e If enabled HW may return timeout interrupt in case HW gets stucked while decoding picture.
1	RW	0x0	sw_dec_irq_dis When hight, there are no interrupts concerning decoder from HW. Polling must be used to see the interrupt status
0	RW	0x0	sw_dec_e Decoder enable. Setting this bit high will start the decoding operation. HW will reset this when the picture is decoded ready or bus error or time out interrupt is given for all decode format.

1.4.5 JPEG Encoder Detail Registers Description

RKEJPEG_VERSION

Address: Operational Base(0x27910800) + offset (0x0000)

Bit	Attr	Reset Value	Description
31:0	RO	0x72010000	RKEJPEG version verision

RKEJPEG_ENC_STRT

Address: Operational Base(0x27910800) + offset (0x0004)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11:8	WO	0x0	vepu_cmd VEPU command: 4'h0: N/A 4'h1: One-frame encoding by register configuration 4'h2: Multi-frame encoding start with link table mode 4'h3: Multi-frame encoding update (with link table mode) 4'h4: Link table encoding force pause 4'h5: contiue link table encoder when link table stop 4'h6: safe_clr 4'h7: force_clr
7:0	WO	0x00	lkt_num Number of new nodes added to Link Table.

RKEJPEG_INT_EN

Address: Operational Base(0x27910800) + offset (0x0010)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12	RW	0x0	lkt_data_error_en link data error interrupt enable
11	RW	0x0	lkt_note_stp_en link table note stop interrupt enable
10	RW	0x0	lkt_fstp_en link cmd force pause interrupt enable
9	RW	0x0	lkt_estp_en link table encoding error stop interrupt enable.
8	RW	0x0	lkt_oerr_en link table opertaion error interrupt enable.
7	RW	0x0	wdg_en Watch dog(time out) interrupt enable.
6	RW	0x0	fenc_err_en bus error interrupt enable.
5	RW	0x0	vbsb_sct_en bit stream buffer write section interrupt enable.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
4	RW	0x0	vbsb_oflw_en Bit stream buffer overflow enable.
3	RW	0x0	vslc_done_en One ecs of encoding finish interrupt enable.
2	RW	0x0	sclr_done_en safe reset interrupt enable.
1	RW	0x0	lkt_node_done_en link node done interrupt enable
0	RW	0x0	fenc_done_en One frame encoding finish interrupt enable.

RKEJPEG_INT_MSK

Address: Operational Base(0x27910800) + offset (0x0014)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12	RW	0x0	lkt_data_error_msk link data error interrupt mask.
11	RW	0x0	lkt_note_stp_msk link table note stop interrupt mask
10	RW	0x0	lkt_fstp_msk link cmd force pause interrupt mask
9	RW	0x0	lkt_estp_msk link table encoding error stop interrupt mask.
8	RW	0x0	lkt_oerr_msk link table opertaion error interrupt mask.
7	RW	0x0	wdg_msk Watch dog(time out) interrupt mask.
6	RW	0x0	fenc_err_msk Frame encoding error interrupt mask.
5	RW	0x0	vbsb_sct_msk bit stream buffer write section interrupt mask.
4	RW	0x0	vbsb_oflw_msk Bit stream buffer overflow mask.
3	RW	0x0	vslc_done_msk One slice of video encoding finish interrupt mask.
2	RW	0x0	sclr_done_msk safe reset interrupt mask.
1	RW	0x0	lkt_node_done_msk link node done interrupt mask.
0	RW	0x0	fenc_done_msk One frame encoding finish interrupt mask.

RKEJPEG_INT_CLR

Address: Operational Base(0x27910800) + offset (0x0018)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12	RW	0x0	lkt_data_error_clr link data error interrupt clear
11	WO	0x0	lkt_note_stp_clr link table note stop interrupt clear
10	WO	0x0	lkt_fstp_clr link cmd force pause interrupt clear
9	WO	0x0	lkt_estp_clr link table encoding error stop interrupt clear.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
8	WO	0x0	lkt_oerr_clr link table opertaion error interrupt clear.
7	WO	0x0	Wdg_clr Watch dog(time out) interrupt clear.
6	WO	0x0	fenc_err_clr Frame encoding error interrupt clear.
5	WO	0x0	vbsb_sct_clr bit stream buffer write section interrupt clear.
4	WO	0x0	vbsb_oflw_clr Bit stream buffer overflow clear.
3	WO	0x0	vslc_done_clr One slice of video encoding finish interrupt clear.
2	WO	0x0	sclr_done_clr Safe clear finish interrupt clear.
1	WO	0x0	lkt_node_done_clr link table one node finish interrupt clear.
0	WO	0x0	fenc_done_clr One frame encoding finish interrupt clear.

RKEJPEG_INT_STATUS

Address: Operational Base(0x27910800) + offset (0x001C)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12	RW	0x0	lkt_data_error_sta link data error interrupt status
11	RO	0x0	lkt_note_stp_sta link table note stop interrupt status
10	RO	0x0	lkt_fstp_sta link cmd force pause interrupt status
9	RO	0x0	lkt_estp_sta link table encoding error stop interrupt status.
8	RO	0x0	lkt_oerr_sta link table opertaion error interrupt status.
7	RO	0x0	Wdg_sta Watch dog(time out) interrupt status.
6	RO	0x0	fenc_err_sta Frame encoding error interrupt status.
5	RO	0x0	vbsb_sct_sta bit stream buffer write section interrupt status.
4	RO	0x0	vbsb_oflw_sta Bit stream buffer overflow status.
3	RO	0x0	vslc_done_sta One slice of video encoding finish interrupt status.
2	RO	0x0	sclr_done_sta Safe clear finish interrupt status.
1	RO	0x0	lkt_node_done_sta link table one node finish interrupt status.
0	RO	0x0	fenc_done_sta One frame encoding finish interrupt status.

RKEJPEG_CRU_CTRL

Address: Operational Base(0x27910800) + offset (0x0020)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
2	RW	0x0	cke auto clock gating enable.
1	RW	0x0	sram_ckg_en encoder sram auto clock gating enable.
0	RW	0x0	resetn_hw_en Encoder auto reset core clock domain when frame finished.

RKEJPEG_LKT_BASE_ADDR

Address: Operational Base(0x27910800) + offset (0x0024)

Bit	Attr	Reset Value	Description
31:7	RW	0x0000000	lkt_addr fst lkt cfg buffer addr 128byte align
6:0	RO	0x00	reserved

RKEJPEG_NODE_OCFG

Address: Operational Base(0x27910800) + offset (0x0028)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:20	RW	0x0	lktw_bus_edin Data swap for link table write channel. [3]: Swap 64 bits in 128 bits [2]: Swap 32 bits in 64 bits [1]: Swap 16 bits in 32 bits [0]: Swap 8 bits in 16 bits
19:16	RW	0x0	lktr_bus_edin Data swap for link table read channel. [3]: Swap 64 bits in 128 bits [2]: Swap 32 bits in 64 bits [1]: Swap 16 bits in 32 bits [0]: Swap 8 bits in 16 bits
15:6	RO	0x000	reserved
5	RW	0x0	lkt_node_stop_en the enable of lkt frame stop when the frame end
4	RW	0x0	lkt_err_stop_en the enable of lkt error stop next frame
3:0	RW	0x0	core_id Only the ejpeg with the same core ID can use this node.

RKEJPEG_WDG_JPEG

Address: Operational Base(0x27910800) + offset (0x002C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	wdg_jpeg jpeg encoder timeout threshold. 32'h0: No time limit 32'hx: x*1 core clock cycles

RKEJPEG_LOW_DELAY_ECS_OCFG

Address: Operational Base(0x27910800) + offset (0x0034)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30:0	WO	0x00000000	low_delay_ecs_ocfg read ecs num.

RKEJPEG_LOW_DELAY_PACKET_OCFG

Address: Operational Base(0x27910800) + offset (0x0038)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30:0	WO	0x00000000	low_delay_packet_ocfg read pack num.

RKEJPEG_ADR_QTBL_JPEG

Address: Operational Base(0x27910800) + offset (0x0040)

Bit	Attr	Reset Value	Description
31:7	RW	0x0000000	Qtbl_base_addr address of JPEG qtbl buffer,128byte align
6:0	RO	0x00	reserved

RKEJPEG_ADR_BSBT_JPEG

Address: Operational Base(0x27910800) + offset (0x0044)

Bit	Attr	Reset Value	Description
31:4	RW	0x0000000	bsbt_addr_jpeg High 25 bits top address of JPEG bit stream buffer.16byte align
3:0	RO	0x0	reserved

RKEJPEG_ADR_BSBB_JPEG

Address: Operational Base(0x27910800) + offset (0x0048)

Bit	Attr	Reset Value	Description
31:4	RW	0x0000000	bsbb_addr_jpeg bottom address of JPEG bit stream buffer.16byte align
3:0	RO	0x0	reserved

RKEJPEG_ADR_BSBR_JPEG

Address: Operational Base(0x27910800) + offset (0x004C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	bsbr_addr_jpeg Read address of JPEG bit stream buffer

RKEJPEG_ADR_BSBS_JPEG

Address: Operational Base(0x27910800) + offset (0x0050)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	adr_bsbs_jpeg Start address of JPEG bit stream buffer

RKEJPEG_ADR_ECS_LEN

Address: Operational Base(0x27910800) + offset (0x0054)

Bit	Attr	Reset Value	Description
31:3	RW	0x00000000	adr_ecs_len Start address of JPEG ecs len buffer .8byte align
2:0	RO	0x0	reserved

RKEJPEG_ADR_SRC0_JPEG

Address: Operational Base(0x27910800) + offset (0x0058)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:4	RW	0x0000000	adr_src0_jpeg adr_src0_jpeg Base address of the 1st storage area for video source, based on byte. YUYV422 and UYUV422 have only one storage area, while adr_src0 is configured as the base address of video source frame buffer. YUV422/420 semi-planar have 2 storage area, while adr_src0 is configured as the base address of Y frame buffer. YUV422/420 planar have 3 storage area, while adr_src0 is configured as the base address of Y frame buffer. Note that if the video source is compressed by AFBC, adr_src0 is configured as the base address of header buffer, and it is 16-byte aligned.
3:0	RO	0x0	reserved

RKEJPEG_ADR_SRC1_JPEG

Address: Operational Base(0x27910800) + offset (0x005C)

Bit	Attr	Reset Value	Description
31:4	RW	0x0000000	adr_src1_jpeg Base address of the 2nd storage area for video source. YUYV422 and UYUV422 have only one storage area, while adr_src1 is reserved. YUV422/420 semi-planar have 2 storage area, while adr_src1 is configured as the base address of CHROMA frame buffer. YUV422/420 planar have 3 storage area, while adr_src1 is configured as the base address of U frame buffer. Note that if the video source is compressed by AFBC, adr_src1 is configured as the base address of body buffer.
3:0	RO	0x0	reserved

RKEJPEG_ADR_SRC2_JPEG

Address: Operational Base(0x27910800) + offset (0x0060)

Bit	Attr	Reset Value	Description
31:4	RW	0x0000000	adr_src2_jpeg Base address of V frame buffer when video source is uncompress and color format is YUV422/420 planar.
3:0	RO	0x0	reserved

RKEJPEG_AXI_PREF_CTRL0

Address: Operational Base(0x27910800) + offset (0x0068)

1.5 Application Notes

1.5.1 MMU Configuration Flow

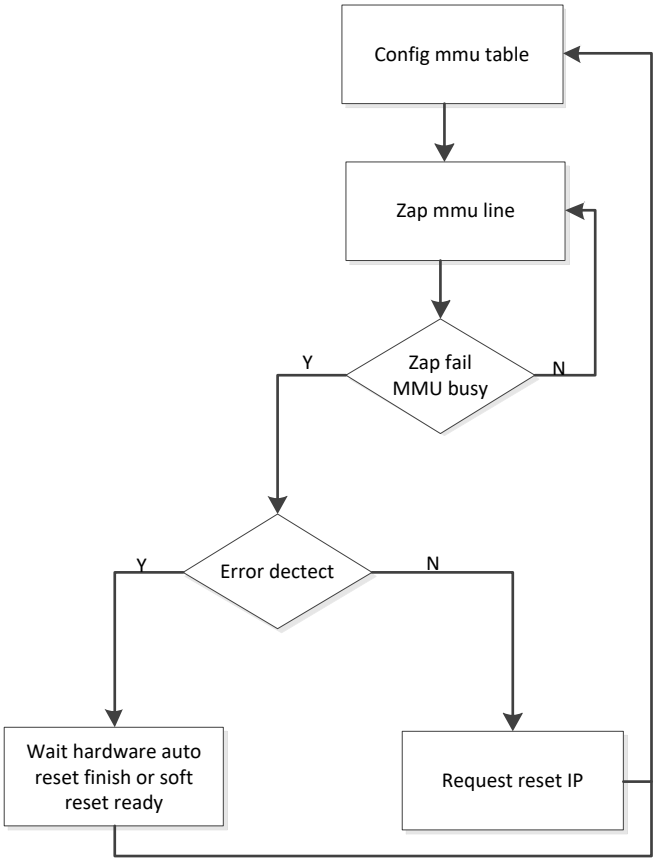

Fig. 1-5 MMU configure flow

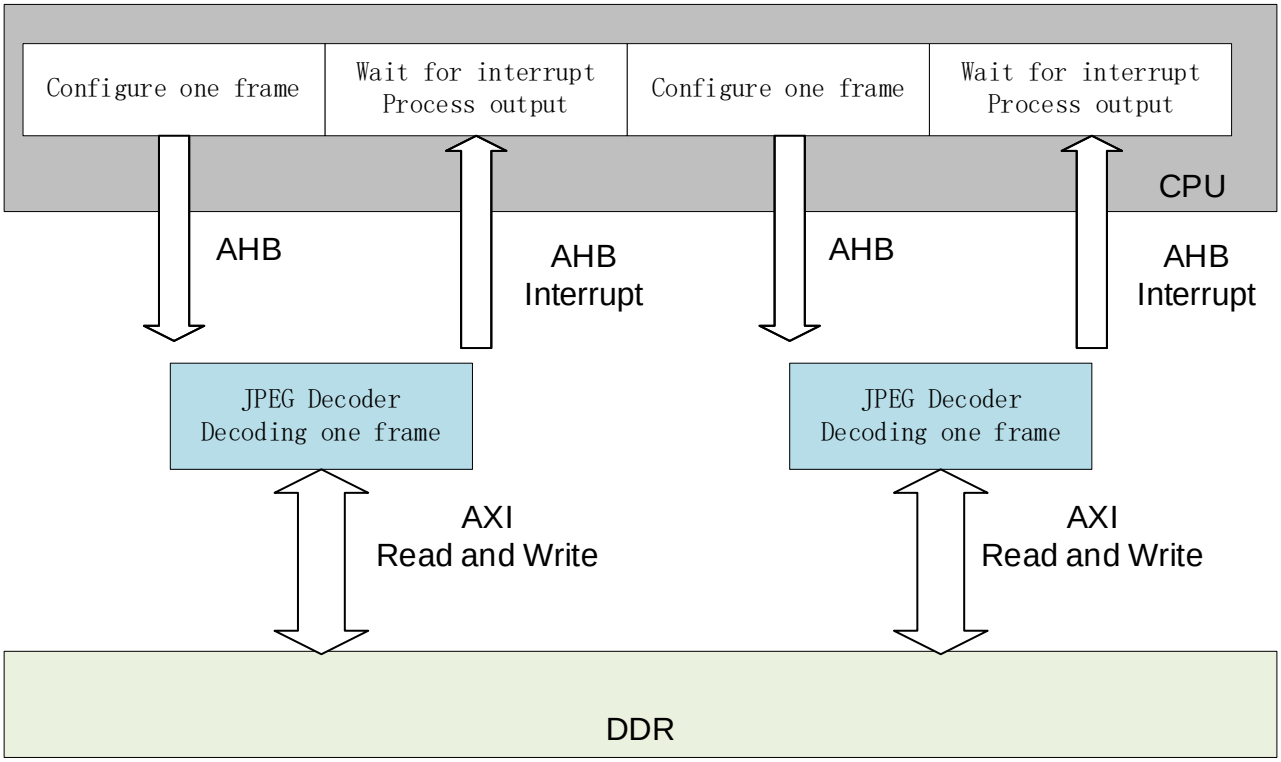
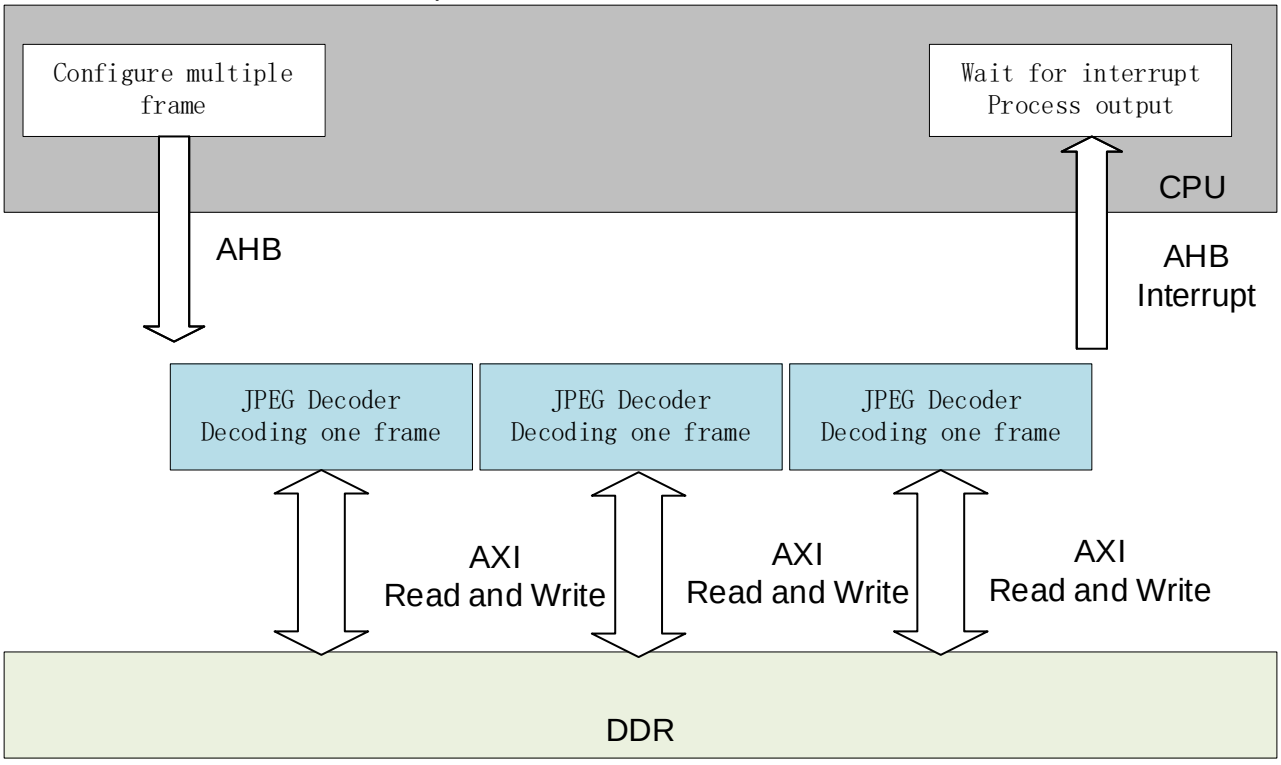
1. Prepare MMU table to DDR and configure DTE address before begin to decoder.
2. If the MMU table have been changed, you will zap one MMU line.
3. If you zap success, you can continue to zap next line.
4. If you zap fail, maybe some error happened, then you should check if there any error happened when decoding.
5. If some error happened, you should wait reset finish, and then re-start MMU configure.
6. If don’t have any error find, it will still need to reset, and then re-start MMU configure.



During MMU working, error might be happened, in such case, user must follow the MMU TRM to properly handle these errors.

Copyright © 2024 Rockchip Electronics Co., Ltd.



1.5.2 JPEG Codec Workflow

Both decoder and encoder support two workflows, the regular mode for frame by frame and the linked table mode for batch operation.

In regular mode, the coded is expected to work frame by frame, starting with register configuration, and ending with interrupting. Each frame is processed under the control of CPU.

In link table mode, user can prepare multiple frame configurations in DDR before coding, or append new frames while the codec is still processing the previous frame. This mode can saves waiting time, reduces interrupt handling and configuration operations, and allows the codec and software to work in parallel.

1.5.3 JPEG Decoder Regular Mode Configuration Flow

1. Prepare the decoder data in the DDR memory.
2. Configure all the registers will be used, except rkdjpeg_swreg1_int, which must be

configured at last.
3. Configure rkdjpeg_swreg1_int to start JPEG decoder.
4. Wait for the interrupt, and then check if the frame decoder ready interrupt is right or not, after that, you can get the processed results in the target DDR.
5. Clear all the interrupts, repeat step 2~4 to start a new frame decoder or encoder.

1.5.4 JPEG Decoder Linked Table Mode Configuration Flow

1. Prepare all the register configuration value into DDR.
2. Configure rkdjpeg_swreg194_link_mode and rkdjpeg_swreg198_link_mode_en
3. Configure rkdjpeg_swreg195_config_done to make the link table register configuration effective, hardware will begin to decoder frame by frame.
4. If you need to add more frame, append configuration to DDR, and set link table mode register, and enable the working flag by configure rkdjpeg_swreg194_link_mode and rkdjpeg_swreg195_config_done.
5. If all the frame be decoded, the hardware will hold the working status wait user to process.
6. When you get interrupt, at first, you should clear the interrupt, and then check if there have any error. If any error found by hardware, the hardware will disable link table mode and stop decoder until user restart next link table mode. And then you can get more information about error type from register.
9. When you get interrupt, if there doesn't have any error, you may be to check the frame number which have been decoded.
10. Please note that: when configure any link table register, rkdjpeg_swreg195_config_done must be set to make it effective.

The register configuration need to be stored in DDR shall be organized as follow:

1.5.5 JPEG Encoder Regular Mode Configuration Flow

1. Prepare the decoder data in the DDR memory.
2. Configure all the registers will be used, except rkdjpeg_swreg1_int, which must be configured at last.
3. Configure RKEJPEG_ENC_STRT to start JPEG decoder.
4. Wait for the interrupt, and then check if the frame decoder ready interrupt is right or not, after that, you can get the processed results in the target DDR.
5. Clear all the interrupts, repeat step 2~4 to start a new frame decoder or encoder.

1.5.6 JPEG Encoder Linked Table Mode Configuration Flow

1. Prepare all the register configuration value into DDR.
2. Configure RKEJPEG_LKT_BASE_ADDR and RKEJPEG_NODE_OCFG.
3. Configure RKEJPEG_ENC_STRT to make the link table register configuration effective, hardware will begin to decoder frame by frame.
4. If you need to add more frame, append configuration to DDR, and configure RKEJPEG_ENC_STRT.
5. If all the frame be decoded, the hardware will hold the working status wait user to process.
6. When you get interrupt, at first, you should clear the interrupt, and then check if there have any error. If any error found by hardware, the hardware will disable link table mode and stop decoder until user restart next link table mode. And then you can get more information about error type from register.
9. When you get interrupt, if there doesn’t have any error, you may be to check the frame number which have been decoded.

Chapter 2 Video Display Post Processor (VDPP)

2.1 Overview

The Video Display Post Processor (VDPP) fetches data from system main memory and transmits data to system main memory by AXI bus. The main function is to enhance the picture quality.

VDPP is composed by DEI(De-interlace), VEP(Video Enhance Processor) and DCIHIST.

The features of DEI are as follows:

- **Image format**
  - Input data: YUV420/YUV422; Semi-planar/planar; UV swap
  - Output data: YUV420/YUV422; Semi-planar; UV swap; Tile mode
  - Max resolution for dynamic image up to 1920x1080
- **De-interlace**
  - **I5O2**: Input 5 Fields Output 2 frames mode
  - **I5O1T**: Input 5 Fields Output 1 Top frame mode
  - **I5O1B**: Input 5 Fields Output 1 Bottom frame mode
  - **I2O2**: Input 2 Fields Output 2 frames mode
  - **I1O1T**: Input 1 Field Output 1 Top frame mode
  - **I1O1B**: Input 1 Field Output 1 Bottom frame mode
  - **PULLDOWN_REC**: Pull-down Recovery mode
  - **DETECT_ONLY**: Detect Only mode
  - **FF DETECT**: Frame Field Detection
  - **FO DETECT**: Field Order Detection
  - **PD DETECT**: Pull Down Detection

The features of VEP are as follows:

- **Image format**
  - Input data: YUV420; Semi-planar; UV swap
  - Output data: YUV444; Semi-planar; UV swap;
  - YUV support up sampling conversion from 420 to 444 by ZME module
  - Input and output max resolution for dynamic image up to 1920x1080
- **DMSR**
  - De-Mosquito noise, De-Ringing effect and De-Shooting effect
  - Only process the Y 8bit component
- **ES（Edge Smoothing）**
  - Only process the Y 8bit component
  - The maximum supported image width: 1280;
- **ZME（Zoom Manage Engine）**
  - Video resize based Multi-phase Algorithm
  - Horizontal arbitrary non-integer scaling ratio, from 1/7 to 8
  - Vertical arbitrary non-integer scaling ratio, from 1/6 to 6
  - Dering
- **SHARP**
  - Support maximum width: 1920
  - Input and output image data format: YUV 10bit

The features of DCIHIST are as follows:

- **Image format**
  - RGB format: RGB888/ARGB8888/RGB101010
  - YUV Semi-Planer format：Y 8bit/10bit

The common features are as follows:

- **Interface**
  - 32bit AHB bus slave
  - 128bit AXI bus master
  - Combined interrupt output

Copyright © 2024 Rockchip Electronics Co., Ltd.

- Y and UV component independent resolution output
- QOS

2.2 Block Diagram

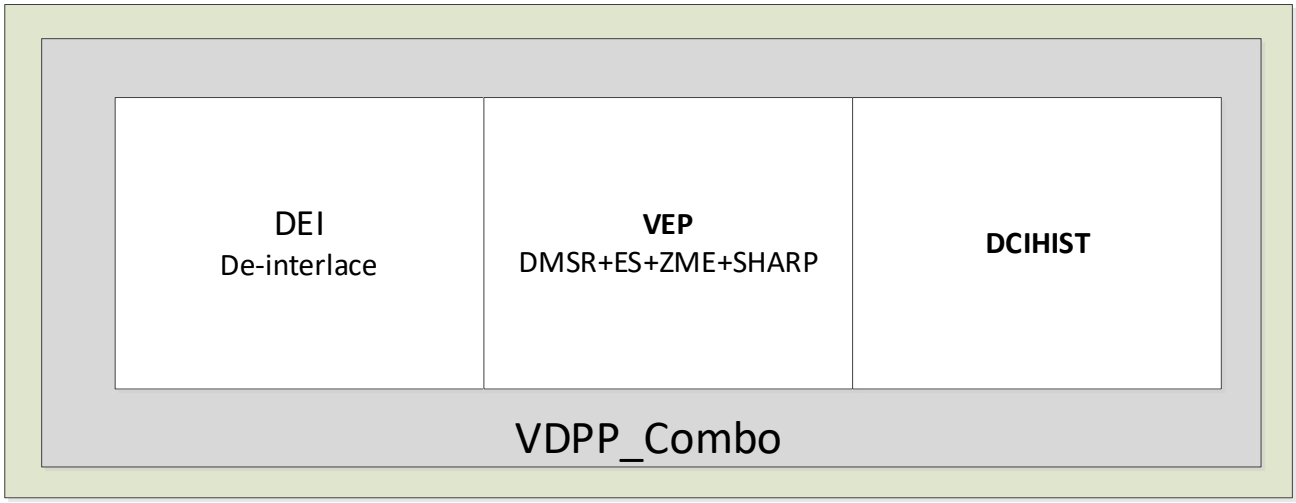

Fig. 2-1 Combo Block Diagram

As shown in the figures above, VDPP is composed by DEI(De-interlace), VEP(Video Enhance Processor) and DCIHIST.

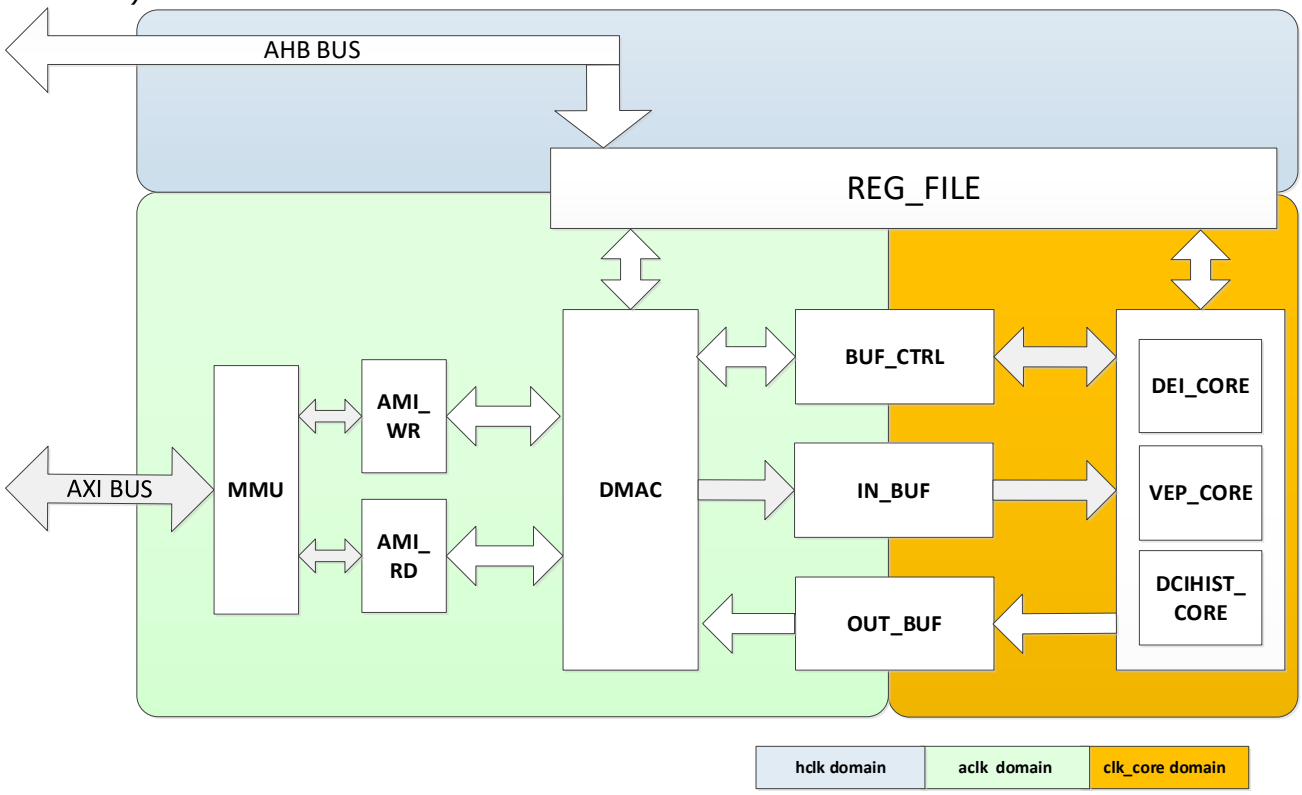

Fig. 2-2 VDPP block diagram

The data path in VDPP is in the previously diagram. The VDPP comprises with:

DEI_CORE
There are eight de-interlace modes (refer to feature description above) in the DIL_CORE block. Some important functions for deinterlace are in this module such as MD, ME, MC, EEDI.

VEP_CORE
DMSR

Copyright © 2024 Rockchip Electronics Co., Ltd.

DMSR stands for De-Mosquito noise, De-Ringing effect and De-Shooting effect.

ES
Smoothing edge sawtooth for small chip sources with a width of less than 1280 pixels.

ZME
ZME is used to resize the image with programmable poly-phase filter.

SHARP
Sharpen the Y component of the image

DCIHIST_CORE
DCIHIST_CORE module dynamically adjusts the brightness and contrast of the image to make it more transparent

DMA
DMA block responses for reading frame data from DDR and writing frame data to DDR.

REG FILE
All configurable signals will be configured in this block and send to other function modules for using.

2.3 Function Description

2.3.1 Deinterlace

There are eight deinterlace modes including I5O2, I5O1B, I5O1T, I2O2, I1O1B, I1O1T and detect only mode in the deinterlace block.

I5O2 mode
The I5O2 mode represents for 5 fields of input images and 2 frames of output images. This mode is the most frequently used. The input source images are stored as interlaced mode which means top field and bottom field are stored by the method that one top field line follows one bottom field or conversely. So, current, next and preview input frame address (SRC_ADDR_CURY, SRC_ADDR_NXTY and SRC_ADDR_PREY for Y channel) need to be configured. Top frame and bottom frame address (DST_ADDR_TOPY, DST_ADDR_BOTY for Y channel) need to be configured for output 2 frames.

I5O1B/T mode
The I5O1B and I5O1T mode have the same input images as the I5O2 mode, but only one frame output is generated which means only need configure one output frame address(top frame address for I5O1T mode and bottom frame address for I5O1B mode).

I2O2 mode
The I2O2 mode only need current input source frame, output is the same as I5O2 mode. This mode is the fastest and the most bandwidth saving.

I1O1B/T mode
The I1O1B and I1O1T mode just need read one filed. The output is same as I5O1B and I5O1T mode.

Bypass mode
If bypass mode is selected, there are not any deinterlace operations.

Pulldown Recovery mode
If the pulldown detection block detects the current source is pulldown interlace video. DEI supports pulldown recovery by setting this mode.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Detect Only mode
This mode has no output frames for saving power and bandwidth. All of the detection results will be read back though AHB bus.

2.3.2 DMSR
After the image is compressed, the high-frequency information is lost due to compression quantization, which leads to the phenomenon of beating at the edge, which is called mosquito noise. DMSR stands for De-Mosquito noise, De-Ringing effect and De-Shooting effect.
The DMSR module only processes the Y component in image. By calculating the direction of each 8x8 block and the possibility of noise, the DMSR uses nonlinear low-pass filters to smooth the edges.

2.3.3 ES
The function of the Edge Smoothing module is to carry out low-pass filtering on the image along the edge before the small resolution image is magnified, so as to solve the sawtooth phenomenon generated when the small resolution image is magnified.

2.3.4 ZME
ZME is a image scaler based on polyphase filter that its characteristic is more approaching to ideal low pass filter. In addition, a new dering arithmetic is used to reduce the effect of ring.
The utilization of the hardware resource is mainly considered in the implementation of the entire module. The horizontal and vertical filter taps are 8 and 6, respectively.

2.3.5 SHARP
The main function of this system is to enhance image details and support configuring different strengths of gain for details of different scales and directions. The strength of detail enhancement can be controlled based on the image content, including local gradients, brightness, and variance information. Additionally, it supports controlling the strength of detail enhancement for different color channels of the input.

2.3.6 DCIHIST
The DCI module is mainly used to dynamically adjust the brightness and contrast of the picture according to the brightness distribution of the current picture to make the picture appear more transparent. The method used is mainly based on the histogram distribution of the current picture.

2.4 Register Description
The VDPP has some configuration segment.

2.4.1 Internal Address Mapping
Slave address can be divided into different length for different usage, which is shown as follows.

Table 2-1 VDPP Address Mapping

Base Address[15:12]	Device	Address Length	Offset Address Range
4'b0000	DEI	4096 BYTE	0x0000 ~ 0x0fff
4'b0001	VEP	4096 BYTE	0x1000 ~ 0x1fff
	DCIHIST	32 BYTE	0x10e0 ~ 0x10ff
	VEP_ES	128 BYTE	0x1100 ~ 0x117f
	VEP_SHARP	768 BYTE	0x1200 ~ 0x14ff
4'b0010	VEP_ZME	4096 BYTE	0x2000 ~ 0x2fff

2.4.2 Registers Summary

2.5 Application Notes

2.5.1 DEI Application Notes

Input source definition constraint

The input source definition(destination definition is same with source) must be 16x4 aligned, which means the image width 16 aligned and image height 4 aligned.

Normal configuration flow

- Set DEI related signals based on current video source information and deinterlace mode (must open frame done interruption by asserting the sw_dei_frm_done_en signal)
- Set sw_vdpp_working_mode = 1
- Set frame start by setting signal sw_dei_frm_en = 1
- Wait for DEI frame done interruption
- Read back many kinds of Detection data and MVHIST, analyze these data, get the global MV, OSD information etc

Copyright © 2024 Rockchip Electronics Co., Ltd.

- Configure the MV, OSD information back
- Set frame start for deinterlace loop

2.5.2 VEP Application Notes

Configuration constraint

- The input source definition must be 16x8 aligned, which means the image width 16 aligned and image height 8 aligned
- The output source definition must be 16x2 aligned
- The virtual stride of input and output must 16 byte align
- The smallest input and output definition is 64x16

Normal configuration flow

- Set VEP related signals based on current video source information
- Set sw_vdpp_working_mode = 2
- Set frame start by setting signal sw_vdpp_frm_en = 1
- Wait for VEP frame done interruption
- Set frame start for next loop

DEI+VEP configuration flow

- Start DEI configuration flow, set de-interlace related regs
- Set sw_vdpp_working_mode = 1，start deinterlace by setting signal sw_dei_frm_en = 1
- Wait for DEI frame done interruption
- Start VEP configuration flow, set VEP related regs
- Set sw_vdpp_working_mode = 2, start VEP by setting signal sw_vep_frm_en = 1
- Wait for VEP frame done interruption
- Next DEI+VEP loop

YUVDIFF mode

In Normal configuration flow, set sw_vep_yuvout_diff_en = 1(VEP_CONFIG, 0x0004), set destination image uv component output size(VEP_DST_IMG_SIZE_C, 0x0040).

2.5.3 DCIHIST Application Notes

Normal configuration flow

- Set VEP and DCI related signals based on current video source information
- Set sw_vdpp_working_mode = 3
- Set frame start by setting signal sw_vep_frm_en = 1
- Wait for VEP frame done interruption
- Set frame start for next loop

2.5.4 Some application scenarios

Scenario	Input	Operation
DEI only Case 1	Only i source input	Configure in DEI mode, use VDPP as DEI, refer to DEI for usage
DEI only Case 2	Only i source input	i source is first converted to p source by DEI, then the output p source is used as input, configure in VEP mode, equivalent to i source doing DEI+VEP

Copyright © 2024 Rockchip Electronics Co., Ltd.

VEP only	One or more small p source inputs	Each route does time division multiplexing, only configure in VEP mode
DCIHIST only	Independent source that needs to do DCI. The source may be ARGB, or it may be yuv4k 10bit source	Only do DCIHIST statistics, only output statistical results to DDR
DEI+VEP Case 1	One i source + one p source	i source is configured in DEI mode, p source is configured in VEP mode, each does its own thing, time division multiplexing, the base addresses and interrupts of the two configurations are different
DEI+VEP Case 2	One i source + one p source	i source: DEI+VEP, p source: VEP
DEI+DCI	One i source + one independent source that needs to do DCI	i source: DEI, DCI source: DCIHIST. In this case, it is generally for 4K source to do DCIHIST. At this time, the effects of other sources are not important, but i source must do DEI
DEI+VEP+DCI	One i source + one p source + one independent source that needs to do DCI	i source: DEI, p source: VEP, DCI source: DCIHIST. This is a three-way time division multiplexing, which is rarely used

CHAPTER 3 Video Processing Sub-System (VPSS)

3.1 Introduction

3.1.1 Overview

The Video Processing Sub-System (VPSS) is an image and video stream processing unit with multi-channel output, including video mirror/flip, occlusion, cropping, scaling, rotation, and other functions.

All data is transmitted via the Memory Interface (MI) to an AXI bus system with master interface. Programming is done by register read/write transactions with an AHB slave interface.

VPSS supports the following features:

- Offline DMA input:
  - Line RGB888/ARGB888/RGB565/YUV422/YUV420 SP 8bits
  - Tile4x4 YUV422/YUV420 8bit (Rotate 90/180/270)
  - RKFBCD64x4 YUV444/YUV422/YUV420 8bits
- Online ISP input
- Both DMA and ISP input
- Maximum input: 4672x3504 (width no more than 4672)
- Minimum input: 32x32
- YUV422 processing
- MIRROR: Horizontal Mirror
- CMSC: Cover or Mosaic in 8 areas
- CROP: Cropping on 4 channels
- Channel0 output:
  - Scale: Polyphase filter
  - ASPT_RATIO: Aspective Ratio for image boundary extension
  - Either Line YUV422/YUV420 SP 8bit or Tile4x4 YUV422/YUV420 8bits
  - Flip: Vertical Flip
- Channel1 output:
  - Scale: Bilinear filter
  - ASPT_RATIO: Aspective Ratio for image boundary extension
  - Either Line RGB888/ARGB888/RGB565/YUV422/YUV420 SP 8bits or Tile4x4 YUV422/YUV420 8bit
  - Flip: Vertical Flip
- Channel2 output:
  - Scale: Bilinear filter (output width no more than 1920)
  - ASPT_RATIO: Aspective Ratio for image boundary extension
  - Line YUV422/YUV420 SP 8bit
  - Flip: Vertical Flip
- Channel3 output:
  - Scale: Bilinear filter (output width no more than 1920)
  - ASPT_RATIO: Aspective Ratio for image boundary extension
  - Line YUV422/YUV420 SP 8bits
  - Flip: Vertical Flip
- Either channel0 or channel1 Tile4x4 output
- BUS interface: 32 bit AHB slave; AXI-128 RW; MMU table
- Registers configuration: AHB or AXI-Read
- Low power, auto-gating for each block

3.1.2 Using constrains

1. The virtual stride of all read and write channels is byte unit. Read virtual stride must be configured. When the input is in Line mode, the read virtual stride should be aligned by at least 4, and the image width should be aligned by 2 pixels.

Copyright © 2024 Rockchip Electronics Co., Ltd.

2. When the input mode is Tile4x4, the width and height of the image need to be aligned by 4 pixels. If the Tile4x4 input is rotated, its output is in yuv420 format.
3. When the RKFBCD64x4 decoding format is yuv444, its output is yuv422.
4. Tile4x4 write channel does not support scaling in yuv420 format.
5. For the scaling module of Channel2 and Channel3, if the vertical scaling is bypass, the horizontal scaling output width is not limited by 1920.

3.2 Block Diagram

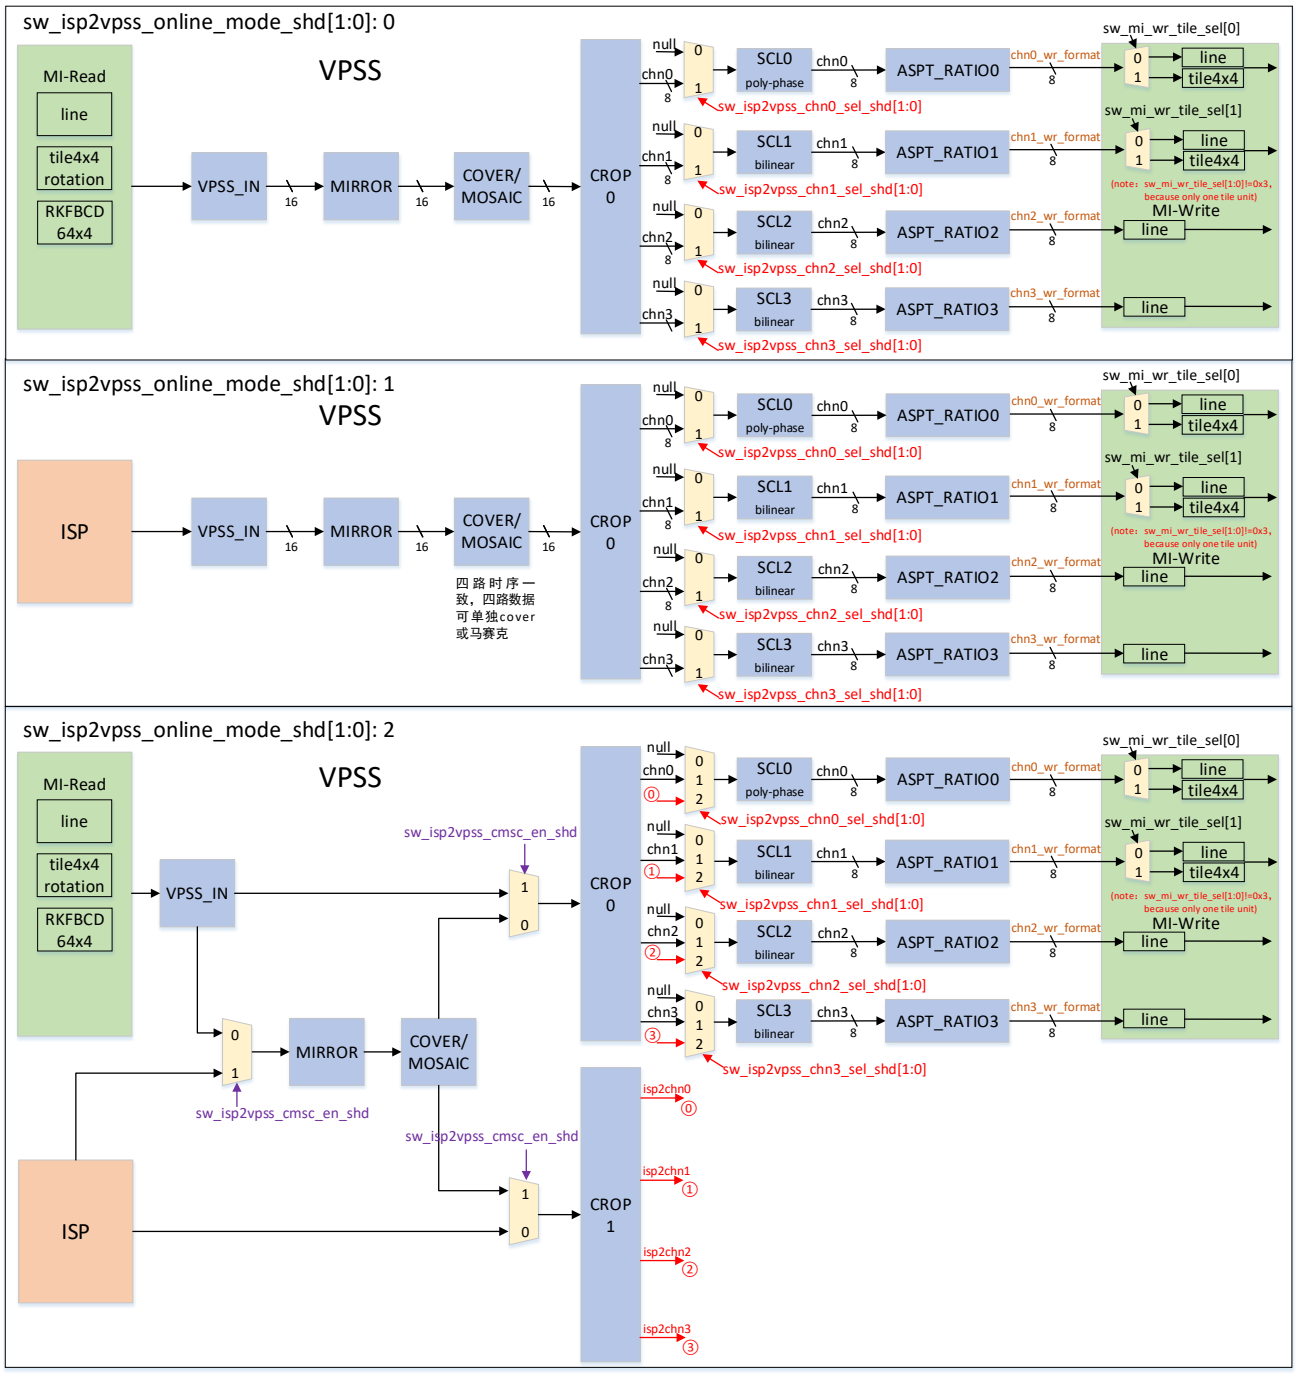

Fig. 3-1 VPSS Block Diagram

VPSS comprises with:

- ISP Direct Interface
- YUV422 Processing
- Memory Interface (MI)

1

3.3 Function Description

3.3.1 Mirror

Horizontal mirror transformation of images in YUV processing.

3.3.2 CMSC

Cover or Mosaic (CMSC) implements the function of adding privacy occlusion to designated areas on the image, with the occlusion method being either specified color overlay or mosaic, and the area being any quadrilateral. The privacy occlusion can be added to four image output channels, which can be independently switched on or off.

3.3.3 Crop

VPSS has two cropping modules, where crop1 is only used by ISP in online mode2.Four output channels support cropping separately.

3.3.4 Scale

3.3.4.1 ZME

Zoom Manage Engine (ZME) is an image scaler based on polyphase filter that its characteristic is more approaching to ideal low pass filter. In addition, a new dering arithmetic is used to reduce the effect of ring.The horizontal and vertical filter taps are 8 and 6, respectively. ZME is used for channel0 scaling in VPSS.

Zoom ratio: Horizontal and vertical scaling are independent of each other. Horizontal arbitrary non-integer scaling ratio, from 1/7 to 8. Vertical arbitrary non-integer scaling ratio, from 1/6 to 6.

3.3.4.2 Bilinear

Bilinear filter is a common interpolation model, which performs Linear interpolation in the horizontal and vertical directions respectively to achieve the purpose of Image scaling. Bilinear interpolation is used for channel1~3 scaling in VPSS.

Zoom ratio: Horizontal and vertical scaling are independent of each other. Horizontal arbitrary non-integer scaling ratio, from 1/32 to 32. Vertical arbitrary non-integer scaling ratio, from 1/32 to 32.

3.3.5 Aspective Ratio

The screen aspect ratio module is used to expand image boundaries.

3.3.6 Memory Interface (MI)

The memory interface unit (MI) is responsible for reading/writing image data from/to the system memory(DDR). The MI has five main tasks, which can operate independently:

- Take image data from the DDR to VPSS
  - Line mode: Either in YCbCr or RGB format
  - Tile mode: YCbCr format
  - RKFBCD mode: YCbCr format
- Take image data from the channel0 to DDR
  - Line mode: YCbCr format
  - Tile mode: YCbCr format, either in channel0 or channel1
- Take image data from the channel1 to DDR
  - Line mode: either in YCbCr or RGB format
  - Tile mode: YCbCr format, either in channel0 or channel1
- Take image data from the channel2, YCbCr format of line mode, and write it into DDR.
- Take image data from the channel3, YCbCr format of line mode, and write it into DDR.

Memory Interface is as following:

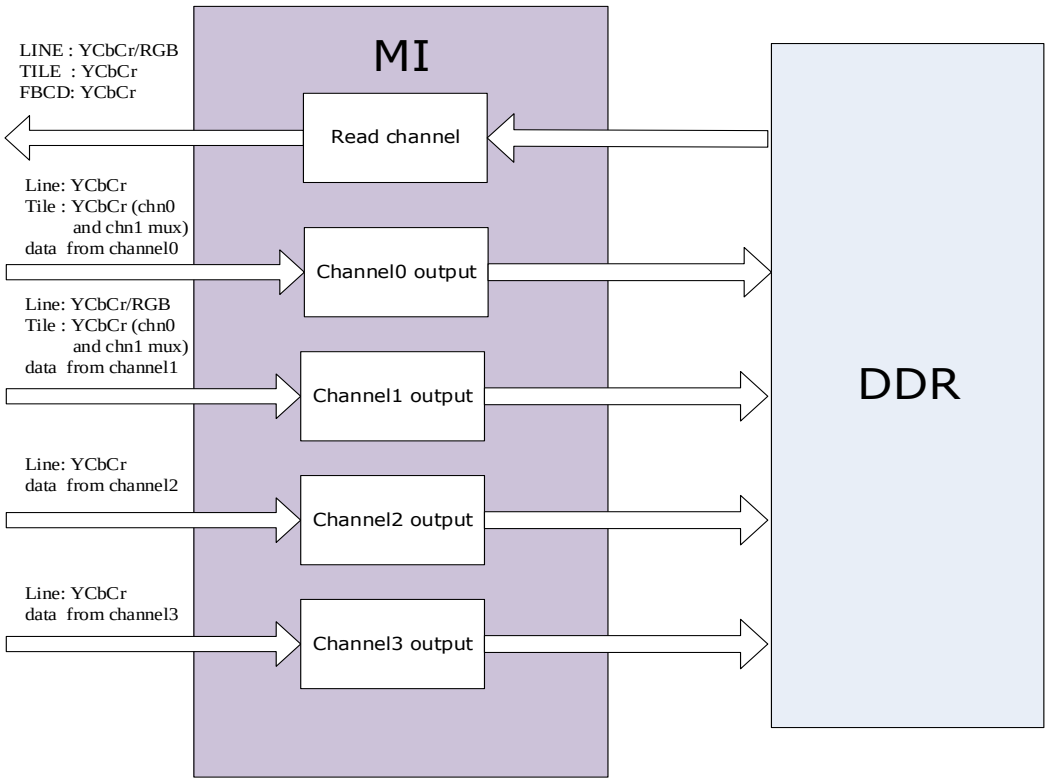

Fig. 3-2 Memory Interface

3.4 Register Description

VPSS adopts a distributed register configuration scheme, so there is no central unit containing all programming registers, but all sub-modules contain their own programming registers. An address space is reserved for each sub-module inside the total VPSS controller.

Table 3-1 VPSS module base address

Module	Description	Offset Address
VPSS_REG	Main control	0x0000
CMSC	Cover and Mosaic	0x0500
QUAD_CROP	VPSS crop	0x0700
	ISP crop	0x0800
SCALE	Chn0 scale, zoom manage engine, poly-phase filter	0x1000
	Chn1 sacle, bilinear	0x1c00
	Chn2 sacle, bilinear	0x2800

3.5 Application Notes

3.5.1 Mirror

1) Set 0x0000[4] sw_mir_en = 1
2) Set 0x0010[4] sys_mir_force_upd = 1, to update the shadow register

3.5.2 CMSC

1) Set 0x0500[0] sw_cmsc_en = 1
2) The four output channels can independently control the CMSC window switches and modes, but share the window vertex, mosaic block size, and cover color configurations
3) Set 0x0504[4] sys_itself_force_upd = 1, to update shadow registers

3.5.3 Crop

The cropping module supports one channel input and four channels output, taking Channel0 as an example:

1) Set 0x0700[1] sw_crop0_en = 1
2) Set 0x0710[13:0] sw_0_h_offs
3) Set 0x0714[13:0] sw_0_v_offs
4) Set 0x0718[13:0] sw_0_h_size
5) Set 0x071c[13:0] sw_0_v_size
6) Set 0x0704[4] sys_cfg_force_upd = 1, to update shadow registers

3.5.4 Scale

3.5.4.1 ZME

ZME is used for CHN0 scaling. The tap coefficients of polyphase filtering need to be selected based on different scaling ratios.

1) Configure Y (0x1810) and UV (0x1830) scaling enable based on the specific scaling case
2) Configure 0x1814[15:0] and 0x1834[15:0] to be equal to scale *input_width* minus 1
3) Configure 0x1814[31:16] and 0x1834[31:16] to be equal to scale *input_height* minus 1
4) Configure 0x1818[15:0] and 0x1838[15:0] to be equal to scale *output_width* minus 1
5) Configure 0x1818[31:16] and 0x1838[31:16] to be equal to scale *output_height* minus

Copyright © 2024 Rockchip Electronics Co., Ltd.

1
6) Configure horizontal and vertical scaling factors
7) Configure tab coefficients
8) Set 0x1804[4] sys_cfg_force_upd = 1, to update shadow registers

3.5.4.2 Bilinear

Channel1~channel3 all use bilinear scaling, taking CHN1 as an example:
1) Configure Y and UV (0x1c00) scaling enable based on the specific scaling case
2) Configure the input resolution of scale 0x1c08[13:0] and 0x1c08[29:16]
3) Configure the output resolution of scale 0x1c0c[13:0] and 0x1c0c[29:16]
4) Configure the horizontal scaling factor of the Y-component 0x1c10[17:0]
5) Configure the horizontal scaling factor of the UV-component 0x1c14[17:0]
6) Configure the vertical scaling factor of the Y-component 0x1c18[17:0]
7) Configure the vertical scaling factor of the UV-component 0x1c1c[17:0]
8) Set 0x1c04[4] sys_cfg_force_upd = 1, to update shadow registers

3.5.5 Aspective Ratio

Channel0~channel3 all support the screen aspect ratio, taking CHN0 as an example:
1) Configure Ratio input width 0x1910[13:0] and height 0x1910[29:16]
2) Configure output width 0x1914[13:0] and height 0x1914[29:16] after boundary filling
3) Configure the offsets of Ratio input-image in output-image ox1918[13:0] and 0x1918[29:16]
4) Set 0x1904[4] sys_cfg_force_upd = 1, to update shadow registers

3.5.6 MI

3.5.6.1 MI Read

VPSS dma-read supports three modes: LINE, TILE, and RKFBCD.
1) According to the read mode, configure 0x3100[9:8] sw_mi_rd_mode
2) If tile rotation mode is used, configure 0x3100[11:10] sw_mi_rd_rot_mode
3) Configure the input image width 0x3114
4) Configure the input image height 0x3118
5) Configure the read start address 0x3110 for Y-component
6) Configure the read start address 0x3120 for UV-component
7) Configure the image virtual stride 0x311c
8) When all MI registers are configured, then set 0x3004[4] = 1, to update shadow registers

3.5.6.2 MI Write

VPSS has four write channels, one of which supports TILE writing for CHN0 and CHN1, and CHN1 can support RGB output. Taking CHN1 as an example:
1) Set channel1 writing enable 0x3300 = 1
2) Configure output image format 0x3300[10:8]
3) Configure the write start address 0x3310 for Y-component
4) Configure image size 0x3314 for Y-component
5) Configure the write start address 0x3320 for UV-component
6) Configure image size 0x3324 for UV-component
7) When all MI registers are configured, then set 0x3004[4] = 1, to update shadow registers

3.5.7 Registers Readback

All registers of VPSS (except MMU) can be configured in AXI readback mode. During registers AXI readback, AHB configuration is also supported, and AHB has a high priority. AXI register configuration is composed of head (address offset + mode + counter) + data, which is shown as below:

	[31:18]	[17:16]	[15:0]
head	addr[15:2]	mode	counter
data	data(32bit)		

Fig. 3-3 AXI register configuration

mode 2'b00 is increased mode, mode 2'b11 is fixed mode, counter is the number of the register configuration, which must be consistent with data number. When data is 32'hffffffff,

Copyright © 2024 Rockchip Electronics Co., Ltd.

registers readback is finished. Here is an example of registers readback:

	[31:18]	[17:16]	[15:0]		
head	0x3c00>>2	00	5		
data	data_0			0x1c00	mode=2'b00, address increment
	data_1			0x1c04	
	data_2			0x1c08	
	data_3			0x1c0c	
	data_4			0x1c10	
head	0x2600>>2	11	6		
data	data_0			0x1000	mode=2'b11, address fixed
	data_1			0x1000	
	data_2			0x1000	
	data_3			0x1000	
	data_4			0x1000	
	data_5			0x1000	
	32'hffff_ffff			结束	

Fig. 3-4 an example of registers readback

The step of registers readback:

1) Calculate the word number of configuration, configure sw_axi_cfg_wsize (0x3168) and sw_axi_cfg_vsize (0x316c). The total word number of configuration is sw_axi_cfg_wsize * sw_axi_cfg_vsize (this product results must be greater than or equal to 64). When sw_axi_cfg_wsize is no more than 8192, set sw_axi_cfg_vsize = 1, otherwise when sw_axi_cfg_wsize is no more than 8192 * 2, set sw_axi_cfg_vsize = 2, and so on.

2) Configure sw_axi_cfg_rd_base (0x3164), where has loaded the AXI register configuration list.

3) Set sys_axi_cfg_rd_st (0x3160[0]) = 1, to start registers readback. There are two modes of registers readback. When sys_axi_cfg_rd_st_mode (0x3160[1]) is configured to 1, registers readback start by configuring sys_axi_cfg_rd_st to 1 in each frame. When sys_axi_cfg_rd_st_mode is 0, registers readback start by sys_axi_cfg_rd_st in first frame, then will start by frame end signal automatically, and on this condition axi_cfg_rd_status (address offset 0x3160[31]) must be cleared by configuring axi_cfg_rd_clear (0x3160[4]) to 1 during current frame.

3.5.8 Online mode

VPSS has three working modes: Mode 0, offline mode; Mode 1, online mode with direct connection to ISP; Mode 2, offline and ISP online coexistence mode shared with VPSS channels.

1) Set 0x0004[17:16] sw_isp2vpss_online_mode = 0, VPSS is in offline working mode, and the image data comes from DDR; Set sw_isp2vpss_online_mode = 1, VPSS receives direct data flow from ISP and is in online working mode; Set sw_isp2vpss_online_mode = 2, VPSS itself is in offline working mode and can receive online data flow from ISP.

2) When sw_isp2vpss_online_mode = 2, if ISP needs to use Mirror and CMSC of VPSS, set 0x0004[18] sw_isp2vpss_cmsc_en = 1, and ISP resolution register 0x0008 is configured; Configure the channel that ISP needs to use, for example, if ISP needs to use channel0, set 0x0004[1:0] sw_isp2vpss_chn0_sel = 2.

3) Set 0x0010[0] = 1, to update shadow registers

3.5.9 IRQ

There are two important interrupt registers in VPSS, VPSS_MIS (0x0078) and MI_MIS (0x3058).

The following chart shows the interrupt sequence between several interrupts:

Copyright © 2024 Rockchip Electronics Co., Ltd.

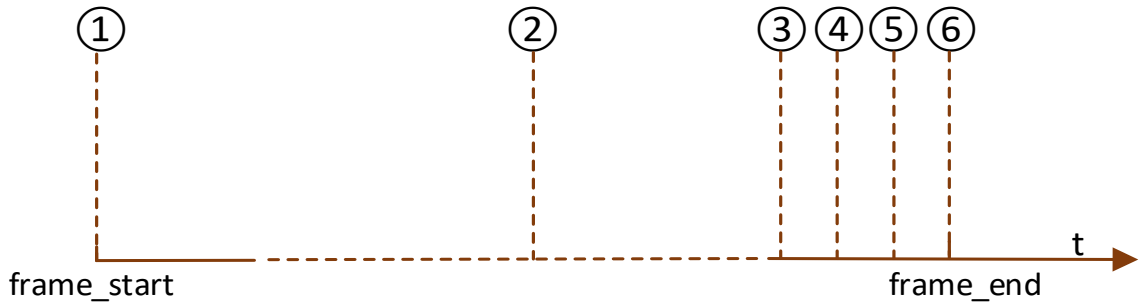

Fig. 3-5 Interrupt Sequence

The meaning of the above numerical symbols are as follows:

Table 3-2 Meaning of IRQ

No.	Interrupt name	Register name	Meaning
1	crop_in_frm_st	VPSS_MIS	Start edge, pull up time is the same as first pixel valid in VPSS
2	crop_in_cfg_irq	VPSS_MIS	The line counter of VPSS has reached the configured number of lines
3	crop_in_frm_end_p	VPSS_MIS	VPSS input frame end
4	scl0_in_frm_end_p	VPSS_MIS	Channel0 scale frame end
5	ratio0_in_frm_end_p	VPSS_MIS	Channel0 aspective_ratio frame end
6	stat_all_frame_end	MI_MIS	MI all channels frame end

Chapter 4 Raster Graphic Acceleration (RGA2.5)

4.1 Overview

RGA2.5 is a separate 2D raster graphic accelerator, use to accelerate basic 2D graphics operations, including: image scaling, rotation, BitBLT, alpha blending.

4.1.1 Features

- **Data format**
  - SRC0 Input data format:
    - ARGB8888/RGBA8888/RGBA4444/RGBA5551
    - RGB888P/RGB565
    - YUV422-P/YUV422-SP-8bit/10bit(clip to 8bit after input)
    - YUV420-P/YUV420-SP-8bit/10bit(clip to 8bit after input)
    - YUV444I/YUV444SP-8bit
    - YVYU422-8bit
    - YUV400-8bit
    - RFBC YUV420/422/444-8bit
    - RFBC YUV420/422/444-10bit(clip to 8bit after input)
    - AFBC32X8(split mode only) ARGB8888/RGB888P
    - AFBC64X4 ARGB8888/RGB888P/RGB565
    - TILE4X4 YUV420/422/444-8bit
    - TILE4X4 YUV420/422/444-10bit(clip to 8bit after input)
    - BPP1/2/4/8
  - SRC1 Input data format:
    - ARGB8888/RGBA8888/RGBA4444/RGBA5551/A8
    - RGB888P/RGB565
  - Output data format(all YUV format is 8bit):
    - ARGB8888/RGBA8888/ARGB4444/RGBA4444/ARGB5551/RGBA5551
    - RGB888/RGB565
    - YUV420/YUV422 P/SP
    - YUV400/Y4
    - TILE4x4 YUV420/422
    - YUV444SP/444I
  - Pixel Format conversion, BT.601/BT.709
  - Dither operation
  - Max resolution: 8192x8192 source, 4096x4096 destination
- **Scaling**
  - Down-scaling: Average/Bilinear filter
  - Up-scaling: Bi-cubic filter(source>1992 would use Bi-linear)
  - Arbitrary non-integer scaling ratio, from 1/16 to 16
- **Rotation**
  - 0, 90, 180, 270 degree rotation
  - x-mirror, y-mirror operation
  - Mirroring and rotation co-operation
- **BitBLT**
  - Block transfer
  - Color palette/Color fill, support with alpha
  - Transparency mode (color keying/stencil test, specified value/value range)
  - Two source BitBLT
  - A+B=B only BitBLT, A support rotate & scale when B fixed
  - A+B=C second source (B) has same attribute with (C) plus rotation function
- **Alpha Blending**
  - Comprehensive per-pixel alpha(color/alpha channel separately)
  - Fading
  - Support SRC1(R2Y)+SRC0(YUV) -> DST(YUV)
  - Support DST Full CSC convert for YUV2YUV

Copyright © 2024 Rockchip Electronics Co., Ltd.

- **OSD Automatic Inversion**
  - Supports OSD sources in ARGB8888/ARGB1555/ARGB444/ARGB2BPP format
  - Support SRC0 and OSD overlay
- **Others**
  - Support square mosaic patterns to cover rectangular mosaic areas
  - Support MMU and MMU table pre-fetch

4.1.2 The Constraints

- YUV420/422-8bit virtual stride need 8byte align, xoff/yoff need 2byte align
- YUV420/422-10bit virtual stride need 16byte align, not support xoff/yoff
- Horizontal Bi-cubic scale up && Vertical scale up Bi-cubic src0 width<=1928
- Horizontal Bi-cubic scale up && Vertical scale up Bilinear src0 width<=3856
- Horizontal Bi-cubic scale up && Vertical scale down or bypass src0 width<=4096

4.2 Block Diagram

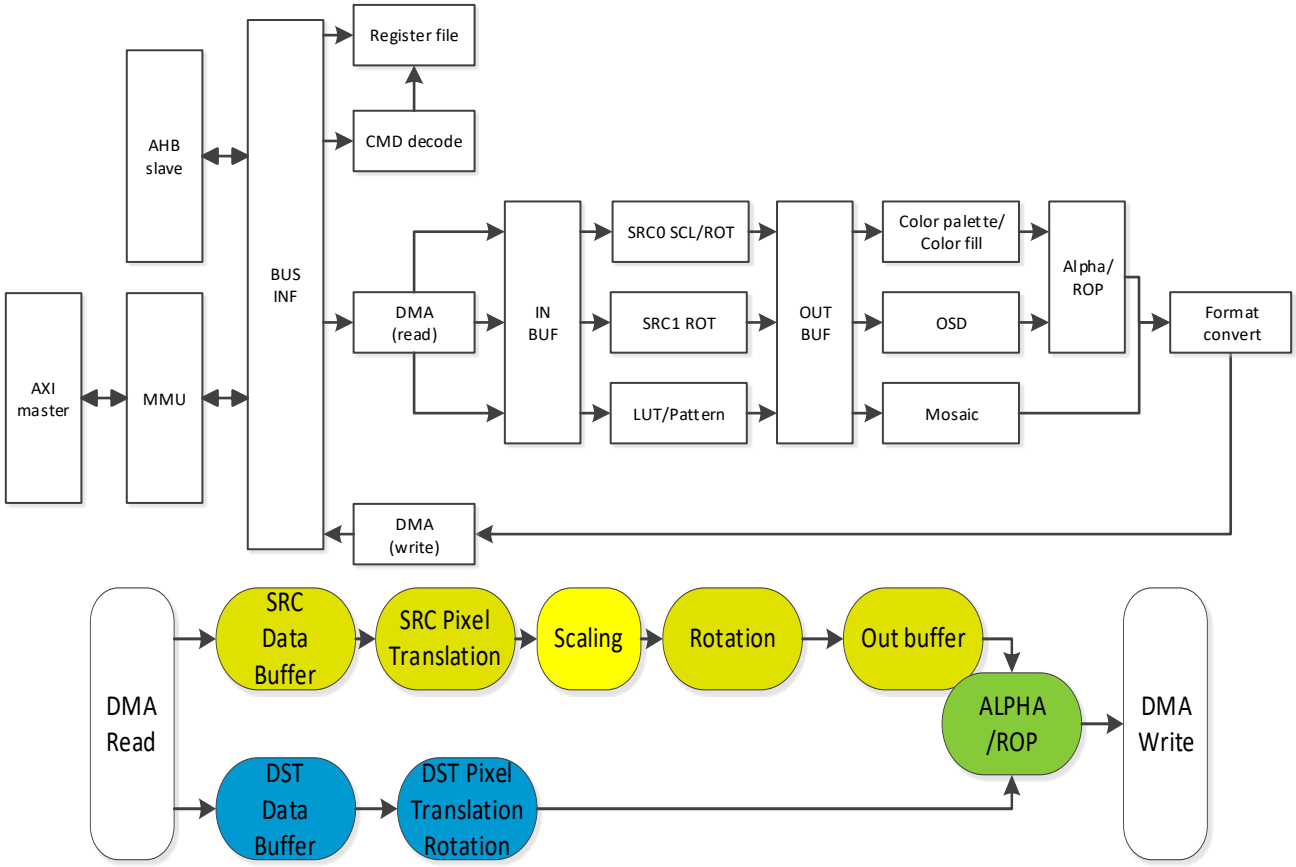

Fig. 4-1 RGA Block Diagram

4.3 Function Description

4.3.1 Data Format

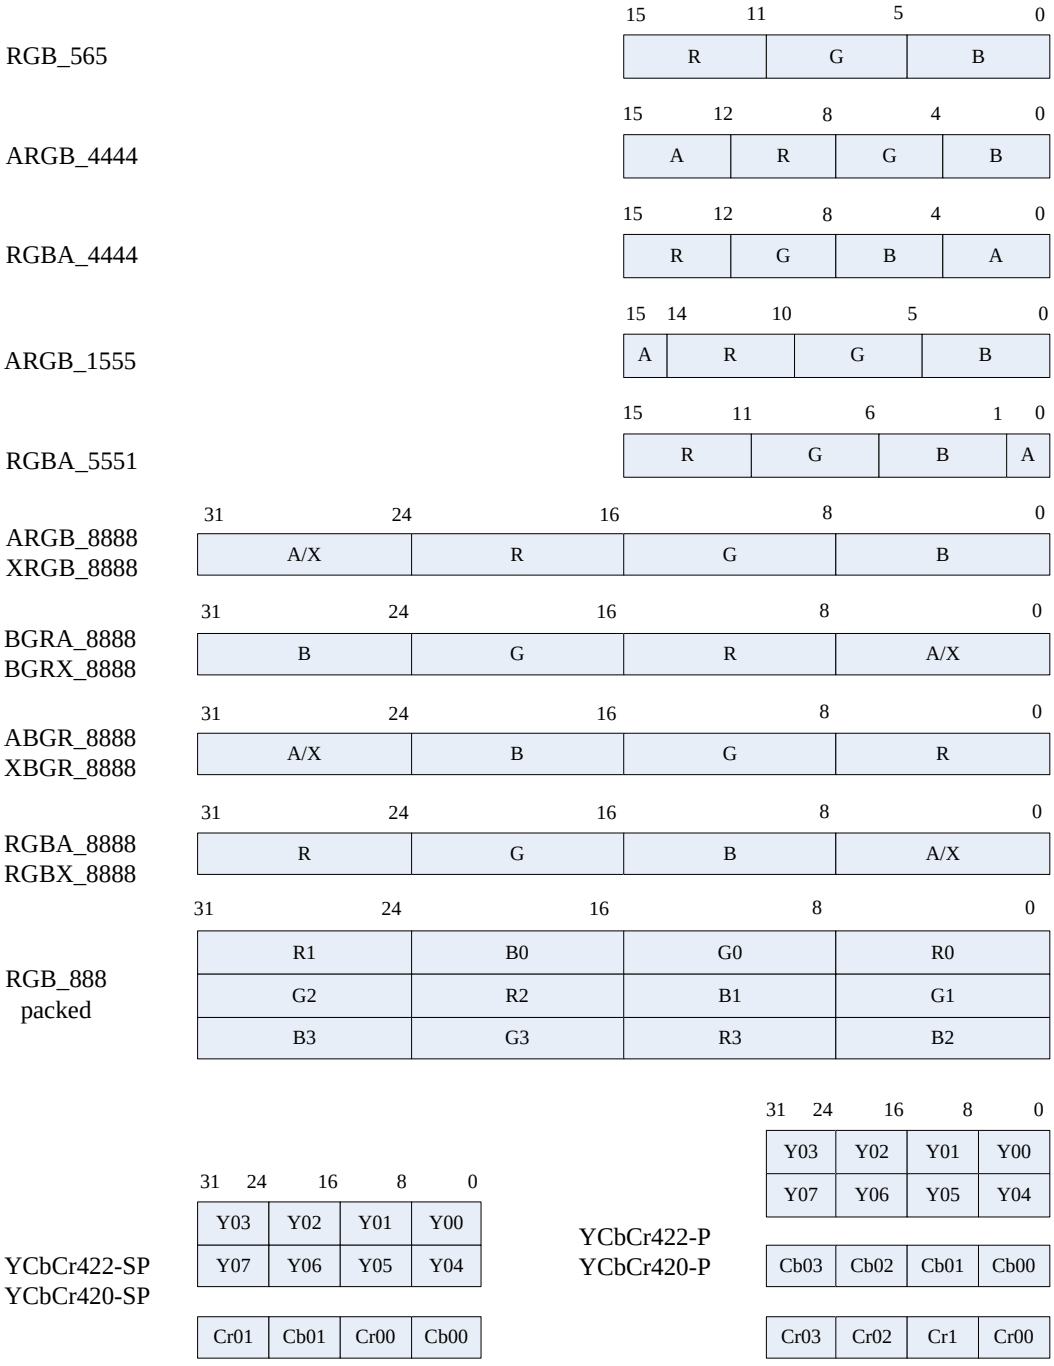

Fig. 4-3 RGA Input Data Format

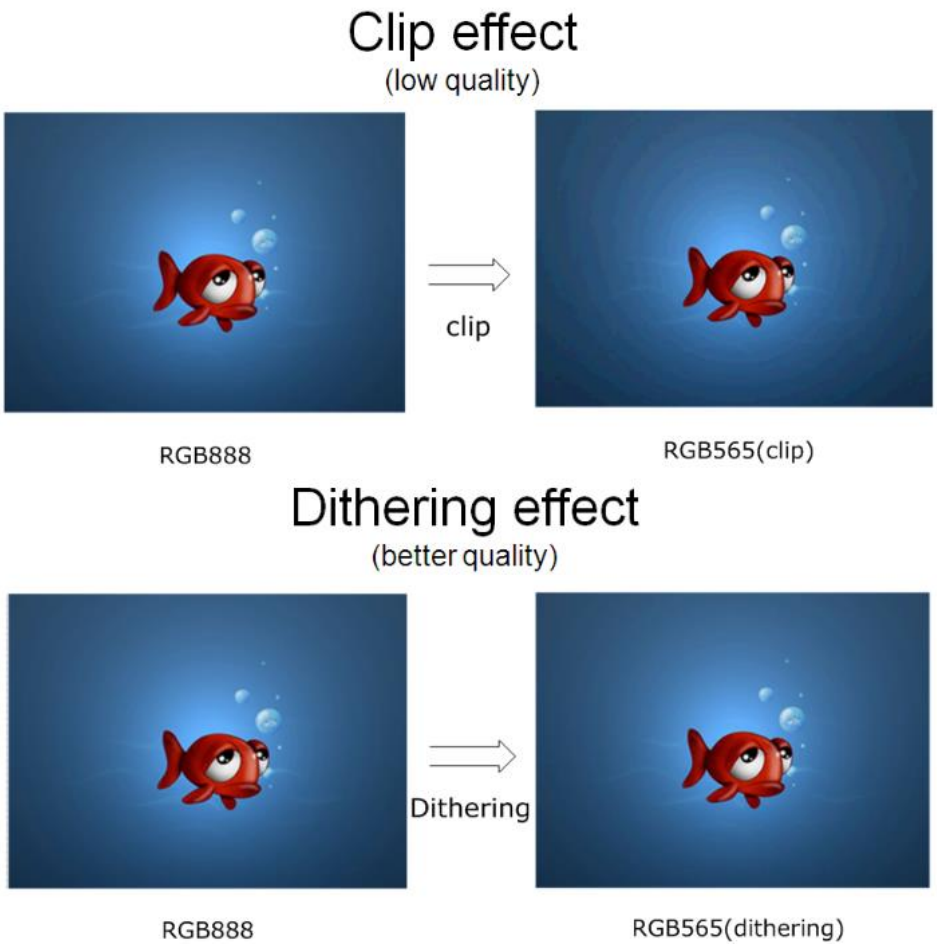
All input data (defined by SRC_IN_FMT/DST_IN_FMT) are converted to ABGR8888/AUYV8888. The results are converted to the output data format (defined by DST_OUT_FMT).

4.3.2 Dithering

There could have dithering operation for source image when the source image format is not RGB565 and the destination format is RGB565.

The down-dithering is done using Dither Allegro.

Copyright © 2024 Rockchip Electronics Co., Ltd.



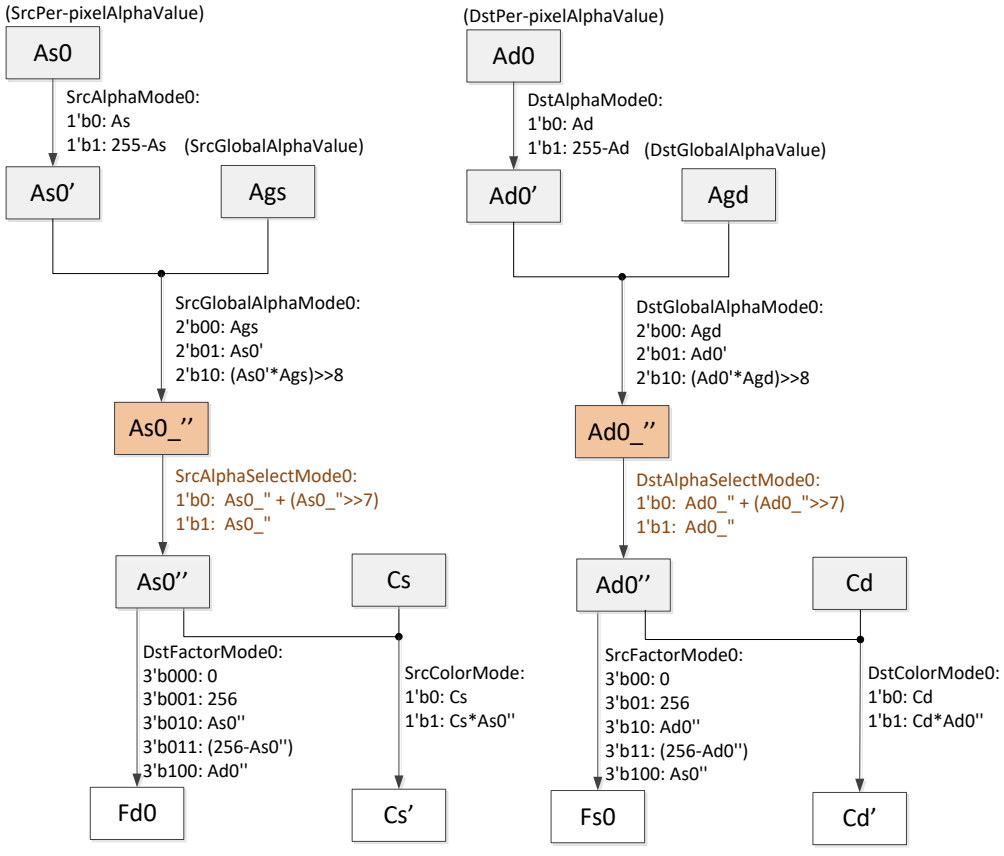


Fig. 4-4 RGA Dither effect

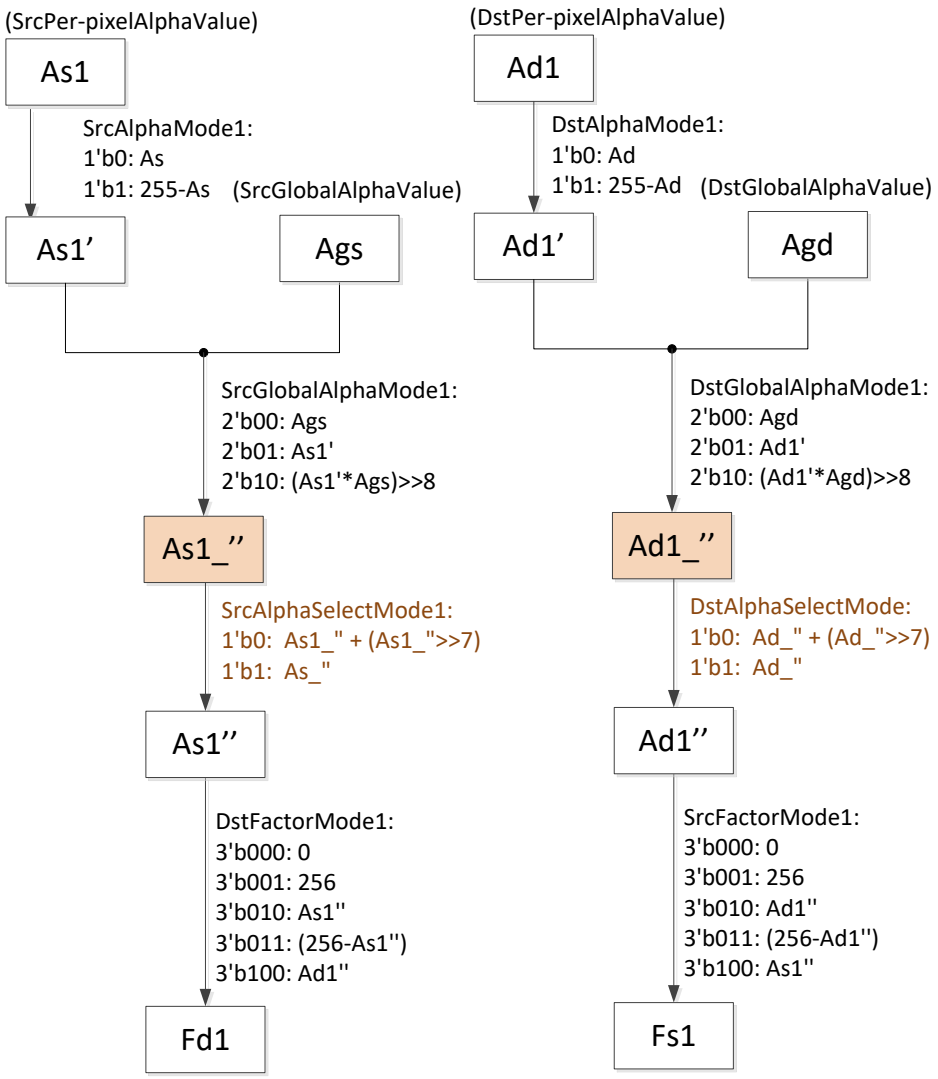

4.3.3 Alpha Mode

$$Cd = Fs0 * Cs' + Fd0 * Cd' \quad (1)$$

(Cd – dst color, Fs0 – color src factor0, Cs' – src color', Fd0 – color dst factor0, Cd' – dst color')

Copyright © 2024 Rockchip Electronics Co., Ltd.

$$Ad = Fs1 * As1'' + Fd1 * Ad1'' \quad (2)$$

(Ad – dst alpha, Fs1 – alpha src factor1, As1'' – src alpha'', Fd1 – alpha dst factor1, Ad1' – dst alpha'')

Fig. 4-5 alpha mode configure description

4.3.4 Color Fill

Two modes of color fill can be done by RGA: solid fill and gradient fill.

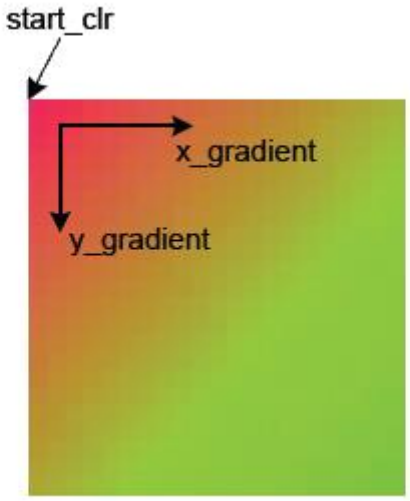

Fig. 4-6 RGA Gradient Fill

Gradient fill using following equations for ARGB calculation of every pixel in different coordinate.

A_cur = (A_start + x*x_A_gradient) +y*y_A_gradient;
R_cur = (R_start + x*x_R_gradient) +y*y_R_gradient;
G_cur = (G_start + x*x_G_gradient) +y*y_G_gradient;
B_cur = (B_start + x*x_B_gradient) +y*y_B_gradient;

A_start, R_start, G_start, B_start is the ARGB value of start point. There are four pairs of values for horizontal and vertical gradient. Saturation operation could be enabled or disabled if the color overflows 255 or underflows 0.

4.3.5 Scaling

The scaling operation is the image reshaping processing of source image. Scaling is done base on ARGB8888 format.
There are three sampling modes: scale down (Average); scale up(Bi-cubic), scale up(Bi-linear).

4.3.6 OSD Automatic Inversion

Supports unidirectional (vertical or horizontal) OSD bars. Support OSD automatic color inversion and regional brightness statistics. The command of statistics and automatic color inversion can be operated at the same time or separately.
The width of each OSD block supports fixed mode and variable mode. The threshold for whether the OSD inverts color can be configured. The brightness statistics or the inverse color flags of OSD blocks can be read by AHB.This function can be used in dash cams, monitors, players, etc.

Fig. 4-7 RGA OSD Figure

4.3.7 Cover Mosaic

The Mosaic function realizes the coverage of the image area, which blurs the specific area.

Fig. 4-8 RGA Mosaic Figure

4.4 Register Description

4.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

Operational Base

Name	Base Address
RGA0	0x27920000
RGA1	0x27930000

Copyright © 2024 Rockchip Electronics Co., Ltd.

4.4.2 Registers Summary

Name	Offset	Size	Reset Value	Description
RGA_SYS_CTRL	0x0000	W	0x00000044	RGA system control register

4.4.3 Detail Registers Description

RGA_SYS_CTRL

Address: **Operational Base** + offset (0x0000)

Bit	Attr	Reset Value	Description
31:14	RO	0x00000	reserved
13	RW	0x0	sw_src1_rgb888_fix_dis SRC1 RGB888 format 4K un-align optimization disable bit.
12	RW	0x0	sw_src0yuv420sp_rd_opt_dis SRC0 YUV420SP format read optimization disable bit.
11	RW	0x0	sw_dst_wr_opt_dis AXI write optimization disable bit(If this bit equal to 0, the write data will continuously in one whole burst)
10	W1C	0x0	sys_cmd_continue_p RGA read continue pulse, and read commands will continue to be sent.
9	RW	0x0	sw_rd_hold_mode_en RGA read hold mode enable bit, the read command will be holden when RGA raising read line count interrupt.
8	RO	0x0	reserved
7	RW	0x0	sys_rst_handsave_p It would save protect-rstn into initial status if long time dead in protect-rstn status(auto clear into '0').
6	RW	0x1	sw_rst_protect_e Protect-rstn mode enable. It would be ensure all AXI write/read operation into completion status when sw_cclk_sreset_p or sw_aclk_sreset_p valid.
5	RW	0x0	sw_auto_rst It would auto-resetn after one frame finish. 1'b0: Disable 1'b1: Enable
4	RW	0x0	sys_cclk_sreset_p RGA core clk domain Soft reset, write '1' to this would reset the RGA engine except config registers.
3	WO	0x0	sys_aclk_sreset_p RGA aclk domain Soft reset, write '1' to this would reset the RGA engine except config registers.
2	WO	0x1	sw_auto_ckg RGA auto clock gating enable bit 1'b0: Disable 1'b1: Enable
1	WO	0x0	sw_cmd_mode RGA command mode 1'b0: Slave mode 1'b1: Master mode

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
0	W1C	0x0	sys_cmd_op_st_p Only used in passive (slave) control mode

RGA_CMD_CTRL

Address: **Operational Base** + offset (0x0004)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19:14	RW	0x3f	sw_max_rd_outstanding
13	RW	0x0	sw_outstanding_cfg_dis
12:3	RW	0x000	sw_cmd_incr_num RGA command increment number
2	WO	0x0	sw_cmd_stop_mode RGA command stop mode Command execution would stop after the current graphic operation finish if set this bit to 1.
1	WO	0x0	sys_cmd_incr_valid_p RGA command increment valid (Auto cleared) When setting this bit, 1. The total command number would increase by the RGA_INCR_CMD_NUM. 2. RGA would continue running if idle.
0	RW	0x0	sys_cmd_line_st_p RGA command line fetch start (command line reset) (Auto cleared) When fetch start, the total command number would reset to RGA_INCR_CMD_NUM.

RGA_CMD_BASE

Address: **Operational Base** + offset (0x0008)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_cmd_base RGA command codes base address

RGA_STATUS1

Address: **Operational Base** + offset (0x000C)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	sw_cmd_total_num RGA command total number
19:8	RO	0x000	sw_cmd_cur_num RGA command current number
7:1	RO	0x00	reserved
0	RO	0x0	sw_rga_sta RGA engine status 1'b0: Idle 1'b1: Working

RGA_INT

Address: **Operational Base** + offset (0x0010)

Bit	Attr	Reset Value	Description
31:25	RO	0x00	reserved
24	W1C	0x0	sys_intr_fbcin_dec_err_clr FBCIN DEC error interrupt clear

4.5 Application Notes

4.5.1 Register Partition

There are two types of register in RGA. The first part registers (0x0 - 0xFC) are general registers for system configuration including command mode, command parameter, RGA status, general interrupts. The other registers (from 0x100) are command registers for command codes.

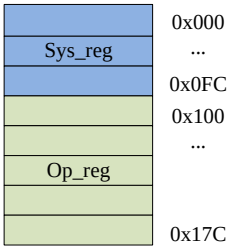

Fig. 4-9 RGA software main register-region

4.5.2 Command Modes

RGA has two command modes: slave mode and master mode. In salve mode (RGA_SYS_CTRL[1] = 1'b0), 2D graphic command only could be run one by one. CPU set all the command registers in RGA and then start RGA running by setting RGA_SYS_CTRL[0] to 1. In master mode (RGA_SYS_CTRL[1] = 1'b1), 2D graphic commands could be run sequentially. After setting command's number to RGA_CMD_CTRL[12:3], writing 1 to RGA_CMD_CTRL[0] will start the command fetch, then Internal command DMA fetch commands from external command line.

Command line is a collection of several command codes with continuous address. At the first start, the command start address (RGA_CMD_ADDR) and command number (RGA_CMD_CTRL[12:3]) should be set, then write 1 to cmd_line_st (RGA_CMD_CTRL[0]) to start the command line fetch. Incremental command is supported by setting cmd_incr_num (RGA_CMD_CTRL[12:3]) and cmd_incr_valid (RGA_CMD_CTRL[1]=1'b1).

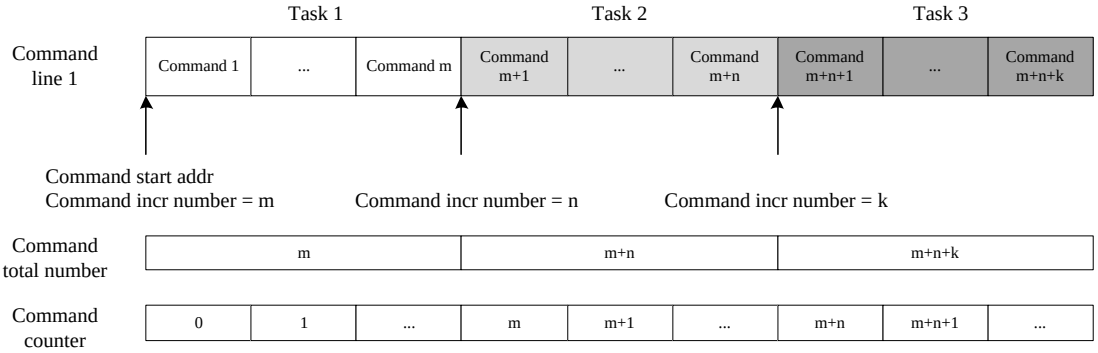

Fig. 4-10 RGA command line and command counter

4.5.3 Command Sync

In slave command mode, command sync is controlled by CPU.
In master command mode, user can enable the current_cmd_int (sw_intr_cf), command by command to generate a interrupt at the end point of target command operation.

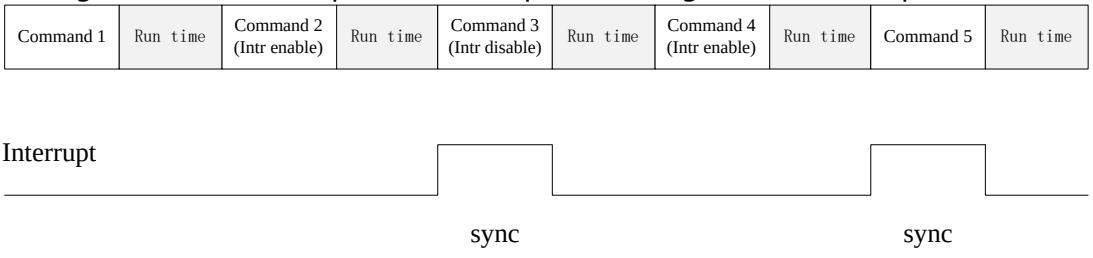

Fig. 4-11 RGA command sync generation

4.5.4 Color Palette Application Notes

1. Palette/LUT Load into special RAM in ELS_BUF_CTRL.
2. Color Palette/Pattern interval operations no need to initial LUT/pattern ram if LUT/pattern content no update.

4.5.5 OSD Automatic Inversion Application Notes

1. In horizontal mode, the width must be greater than or equal to the height, and vice versa.
2. Supports up to 64 OSD blocks, and the width of each OSD ranges from 8 to 2048, so that the size of the OSD area supports up to 4096.
3. The format of SRC0 and the format of DST need to be equal.
4. SRC0 sources format support in YUV422 P/SP,YUV420 P/SP.
5. In OSD width variable mode, the maximum supported width is 512.
6. OSD inverse flags can be configured externally or read from internal storage, and the internal storage supports a maximum of 1024 flags.
7. OSD sources in ARGB2BPP format virtual stride need 32pixel(64bits) align.
8. At least one of the sw_auto_rst or sw_auto_ckg register needs to be closed when using OSD unfix width function.

4.5.6 Some Special Application Constraints

1. The algorithm of vertical scale up: must select BI-cubic algorithm when source picture is smaller or equal to 2k and must select BI-linear when bigger than 2k.

2. The effects that The output’s definition is near 2k or 4k may not very well when at the scenario that the vertical side is scale up and the horizontal is scale down within range of 2%(such as:2048x32, 2008x64).

3. At the scenario A+B->C(A means SRC0, B means DST, C means SRC1), the size among the A B C has some constraints:
A’s size after scale must be equal to C. C’s size must equal to B when A+C is no rotation.
C’s rotation (90degree)size must equal to B1 when A+C is rotation 90 degree.

Chapter 5 DECOM

5.1 Overview

DECOM can decompress compressed files in GZIP, DEFALTE and ZLIB formats. DECOM controller supports the following features:

- Support for decompressing GZIP files
- Support for decompressing data in DEFLATE format
- Support for decompressing data in ZLIB format
- Not support for decompressing LZ4 files
- There is a 32bit APB slave interface for configuring decompression parameters and querying register status
- There is a 128-bit AXI master interface for reading compressed data and outputting decompressed data. The AXI master interface supports burst 4/8/16 and single transmissions
- Support one internal 128-bit wide and 64-location deep FIFO(RX_FIFO) for caching source compressed data
- Support one internal 24-bit wide and 64-location deep FIFO(HF_FIFO) for caching intermediate data during decompression
- Built-in a 8KB two-port RAM for storing decompressed data
- Support complete interrupt and error interrupt output
- Support the limit_size function of the decompressed data to prevent the memory from being maliciously destroyed during the decompression process
- Support software to stop the decompression process

5.2 Block Diagram

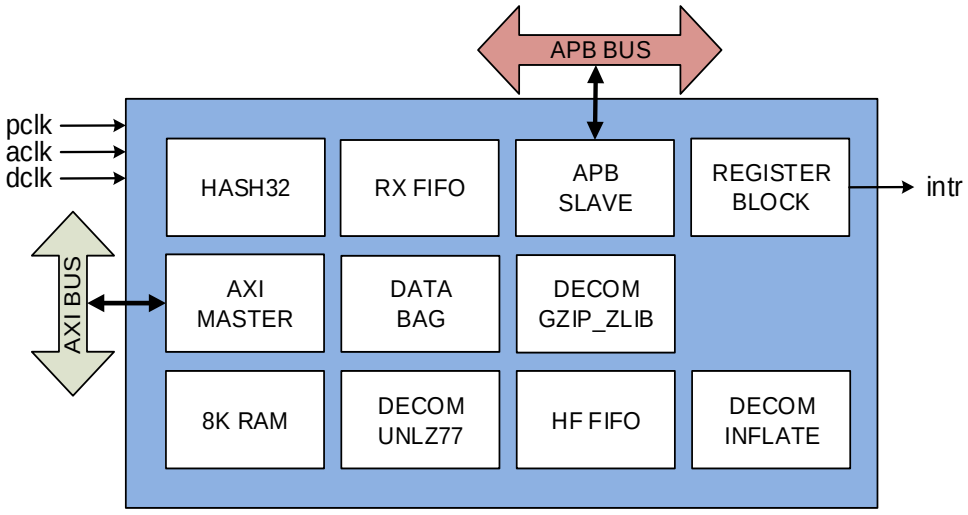

Fig. 5-1 DECOM Block Diagram

5.3 Function Description

5.3.1 Module Introduction

5.3.1.1 APB INTERFACE

The APB slave interface is used for registers configuration, decompression file parameter reading and interrupt status query, etc.

5.3.1.2 AXI MASTER INTERFACE

The AXI master interface is used to read compressed file data from external storage into the RX_FIFO and output the decompressed data to external storage.

Copyright © 2024 Rockchip Electronics Co., Ltd.

5.3.1.3 RX_FIFO

The RX_FIFO is used to buffer the source compressed file data read back through the AXI master interface. The RX_FIFO is an asynchronous FIFO, the write interface uses aclk, and the read interface uses dclk.

5.3.1.4 Data Bag

The Data Bag reads and bites the data in the RX_FIFO, and extracts the corresponding number of bits according to the needs of the decompression module.

5.3.1.5 GZIP_ZLIB

The GZIP_ZLIB module is used to perform file header and file end parsing for compressed files in GZIP format and compressed data in ZLIB format, and the compressed data portion is decompressed by the INFLATE module. The GZIP or ZLIB decompression mode can be configured by configuring the CTRL register.

5.3.1.6 INFLATE Module

INFLATE Module is used to decompress compressed files in DEFLATE format, implement static/dynamic huffman decoding, decompress compressed data in DEFLATE format into LZ77 format (match length-match distance) data pairs or character data, and store them in HF_FIFO.

5.3.1.7 HF_FIFO

The HF_FIFO is used to buffer the LZ77 format (match length-match distance) data pair or character data decompressed by the INFLATE module, and wait for the UNLZ77 module to further decompress the intermediate data. The HF_FIFO is an asynchronous FIFO, the write interface uses dclk, and the read interface uses aclk.

5.3.1.8 UNLZ77 Module

UNLZ77 is used to implement LZ77 decoding and store the decompressed data in 8K RAM. When the matching distance is less than 8k byte, matching replication is performed in 8K RAM. When the matching distance is greater than 8k byte, the AXI master interface is controlled to perform matching replication in the external storage.

5.3.1.9 8K-RAM

The 8K RAM is used to buffer the decompressed data. During the decompression process, the UNLZ77 module also performs read access to the RAM to complete the data matching.

5.3.1.10 Interface and Clock

The 32-bit APB Slave interface in DECOM is used for register configuration and interrupt status query interface, using pclk as the interface clock.

DECOM uses 128bit AXI master interface to realize the functions of reading the data to be compressed, decompressing the data output and reading external matching data; it should be noted that the AXI master interface supports Single and Burst transmission, which only supports incr4, incr8 and Incr16 three transmission types, does not support Wrap transmission. DECOM automatically configures the burst type according to the length of the transmitted data and the starting address. The software configuration is not supported to select the burst type.

DECOM has three sets of clock and reset inputs, pclk and presetn, dclk and drstn, aclk and aresetn. Among them pclk and aclk are APB and AXI bus clocks respectively, and dclk is decompression clock.

5.3.2 Data Flow

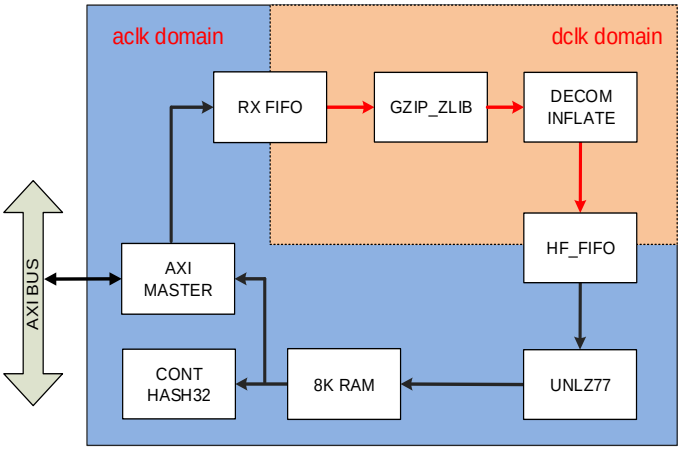

Fig. 5-2 DECOM Data Flow

5.4 Register Description

5.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

5.4.2 Registers Summary

Name	Offset	Size	Reset Value	Description
DECOM_CTRL	0x0000	W	0x00000000	Control Register
DECOM_ENR	0x0004	W	0x00000000	Enable Register
DECOM_RADDR	0x0008	W	0x00000000	Read Address
DECOM_WADDR	0x000C	W	0x00000000	Write Address
DECOM_UDDSL	0x0010	W	0xFFFFFFFF	Undecompressed Data Size
DECOM_UDDSH	0x0014	W	0xFFFFFFFF	Undecompressed Data Size
DECOM_TXTHR	0x0018	W	0x00000100	Transmit Threshold Level
DECOM_SLEN	0x0020	W	0x00000000	INFLATE Store Length
DECOM_STAT	0x0024	W	0x00000000	DECOM Status Register
DECOM_ISR	0x0028	W	0x00000000	Interrupt Status Register
DECOM_IEN	0x002C	W	0x00000000	Interrupt Enable Register
DECOM_AXI_STAT	0x0030	W	0x00000010	AXI Master Interface State
DECOM_TSIZEL	0x0034	W	0x00000000	Decompressed Data Total Size Lower 32bit
DECOM_TSIZEH	0x0038	W	0x00000000	Decompressed Data Total Size Upper 32bit
DECOM_MGNUM	0x003C	W	0x00000000	LZ4 File Magic Number
DECOM_FRAME	0x0040	W	0x00000000	LZ4 File Frame Descriptor
DECOM_DICTID	0x0044	W	0x00000000	Dictionary ID
DECOM_CSL	0x0048	W	0x00000000	LZ4 Content Size(CS) Lower 32-bits
DECOM_CSH	0x004C	W	0x00000000	LZ4 Content Size(CS) Upper 32-bits
DECOM_LMTSL	0x0050	W	0xFFFFFFFF	Limit Size of Decompressed Data
DECOM_LMTSH	0x0054	W	0xFFFFFFFF	Limit Size of Decompressed Data
DECOM_GZFHD	0x0058	W	0x00000000	GZIP/ZLIB File Header Information
DECOM_VERSION	0x00F0	W	0x20211216	DECOM Version Number

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-*

5.4.3 Detail Registers Description

DECOM_CTRL

Address: Operational Base (0x2AC30000) + offset (0x0000)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5	RW	0x0	ZLIBM ZLIB mode. 1'b0: Disable 1'b1: Enable When decompressing ZLIB compressed data, ZLIBM must be enabled and DEM should be set to 1.
4	RW	0x0	GZIPM GZIP mode. 1'b0: Disable 1'b1: Enable When decompressing GZIP files, GZIPM must be enabled and DEM should be set to 1.
3	RW	0x0	CCEN LZ4 content checksum check enable. 1'b0: Disable 1'b1: Enable In LZ4 files, a 32-bits content checksum will be appended at the end of the file. When CCEN is enabled, DECOM will verify the content checksum to check if the decompressed data is correct. Only valid when decompressing LZ4 files.
2	RW	0x0	BCEN LZ4 block checksum check enable. Not used. 1'b0: Disable 1'b1: Enable In LZ4 files, each data block will be followed by a 4-bytes checksum, calculated by using the xxHash-32 algorithm on the compressed data block. The intention is to detect data corruption(storage or transmission errors) immediately, before decoding. When BCEN is enabled, DECOM will check the block checksum to determine if the block to be decompressed is correct. Only valid when decompressing LZ4 files.
1	RW	0x0	HCEN LZ4 header checksum check enable. Not used. 1'b0: Disable 1'b1: Enable The LZ4 header contains a 1-byte xxh32 checksum value(HC). When HCEN is enabled, DECOM will check the HC to check if the header is correct. Only valid when decompressing LZ4 files.
0	RW	0x0	DEM DECOM mode select. 1'b0: UNLZ4 mode. Decompress the file in LZ4 format. 1'b1: INFLATE mode. Decompress the file in INFLATE format. If GZIPM=1'b1 or GZLIBM=1'b1, DEM must be set 1.

DECOM_ENR

Address: Operational Base (0x2AC30000) + offset (0x0004)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
0	R/WSC	0x0	ENR Enables and disables all decompress operations. 1'b0: Disable decompressor 1'b1: Enable decompressor to work All FIFO buffers and aclk/dclk domain work registers are cleared when the device is disabled. Self clear when decompression is complete. The ENR should be enabled after the other registers are configured.

DECOM_RADDR

Address: Operational Base (0x2AC30000) + offset (0x0008)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	RADDR Read address. This register is used to configure the starting address of the file to be decompressed.

DECOM_WADDR

Address: Operational Base (0x2AC30000) + offset (0x000C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	WADDR Write address. This register is used to configure the starting address of the location where the decompressed data is written. Note: WADDR[31:0] must be configured with a 128bit aligned address (WADDR[3:0]==4'b0).

DECOM_UDDSL

Address: Operational Base (0x2AC30000) + offset (0x0010)

Bit	Attr	Reset Value	Description
31:0	RW	0xffffffff	UDDSL Undecompressed data size lower 32bits. (Unit:byte) UDDS[63:0] is the total size of undecompressed file. DECOM will read the compressed file data according to the value of UDDS[63:0], but the configuration of this register is optional. If this register is not configured, DECOM will use the default value of 64'hffff_ffff_ffff_ffff, and DECOM will keep reading data until the current decompression process ends.

DECOM_UDDSH

Address: Operational Base (0x2AC30000) + offset (0x0014)

Bit	Attr	Reset Value	Description
31:0	RW	0xffffffff	UDDSH Undecompressed data size higher 32bits.

DECOM_TXTHR

Address: Operational Base (0x2AC30000) + offset (0x0018)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000100	TXTHR When the number of 8K_MEM entries is greater than or equal to this value, the DECOM will automatically transfer the data in the 8K_MEM to the external via the AXI Master interface. The value ranges is 0~7680.(Unit:byte)

Copyright © 2024 Rockchip Electronics Co., Ltd.

DECOM_SLEN

Address: Operational Base (0x2AC30000) + offset (0x0020)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	SLEN INFLATE store block size. (Unit:byte) Indicate the block size when decompressing the store block of INFALTE file. For debugging SLC_ERR.

DECOM_STAT

Address: Operational Base (0x2AC30000) + offset (0x0024)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RO	0x0	LAST Used to indicate whether the currently processed compressed data block is the last one. 1'b0: Not last block 1'b1: Last block
0	RO	0x0	COMPLETE DECOM complete flag. 1'b0: Not complete 1'b1: Decompress is complete with no error Only decompress total complete with no error, this flag is set to 1.

DECOM_ISR

Address: Operational Base (0x2AC30000) + offset (0x0028)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19	W1C	0x0	DSOLI Decompressed data size over limit_size interrupt. 1'b0: Interrupt is not active 1'b1: Interrupt is active
18	W1C	0x0	ZDICTEI ZLIB dictionary error interrupt. 1'b0: Interrupt is not active 1'b1: Interrupt is active
17	W1C	0x0	GCMEI GZIP/ZLIB compression method check error interrupt. 1'b0: Interrupt is not active 1'b1: Interrupt is active
16	W1C	0x0	GIDEI GZIP ID error interrupt. 1'b0: Interrupt is not active 1'b1: Interrupt is active
15	W1C	0x0	CCCEI UNLZ4 content checksum check error interrupt. 1'b0: ccc_err interrupt is not active 1'b1: ccc_err interrupt is active
14	W1C	0x0	BCCEI UNLZ4 block checksum check error interrupt. 1'b0: bcc_err interrupt is not active 1'b1: bcc_err interrupt is active
13	W1C	0x0	HCCEI UNLZ4 header checksum check error interrupt. 1'b0: hcc_err interrupt is not active 1'b1: hcc_err interrupt is active

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
12	W1C	0x0	CSEI UNLZ4 content size (or GZIP isize) error interrupt. 1'b0: cs_err interrupt is not active 1'b1: cs_err interrupt is active
11	W1C	0x0	DICTEI UNLZ4 dictionary error interrupt. 1'b0: Interrupt is not active 1'b1: Interrupt is active
10	W1C	0x0	VNEI UNLZ4 version number error interrupt. 1'b0: vn_err interrupt is not active 1'b1: vn_err interrupt is active
9	W1C	0x0	MNEI UNLZ4 magic number error interrupt. 1'b0: mn_err interrupt is not active 1'b1: mn_err interrupt is active

DECOM_AXI_STAT

Address: Operational Base (0x2AC30000) + offset (0x0030)

Bit	Attr	Reset Value	Description
31:5	RO	0x0000000	reserved
4	RO	0x1	AXI_IDLE AXI master idle state register. 1'b0: AXI master is busy 1'b1: AXI master is idle When the decompression is aborted, DECOM will wait for AXI master's current read/write transfer to complete, that is, wait for AXI_IDLE=1, then reset DECOM, otherwise the uncompleted AXI transmission will cause AXI bus exception. It should be noted that after the decompression is abnormal, the AXI master's unfinished write operation will continue, but the output value of wstrb[15:0] will become 16'b0.
3:2	RO	0x0	RRESP AXI read channel response state.
1:0	RO	0x0	BRESP AXI write channel response state.

DECOM_TSIZEL

Address: Operational Base (0x2AC30000) + offset (0x0034)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	TSIZEL The total size of the data after decompression. TSIZE[63:0]. (Unit:byte)

Copyright © 2024 Rockchip Electronics Co., Ltd.

DECOM_TSIZEH

Address: Operational Base (0x2AC30000) + offset (0x0038)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	TSIZEH The total size of the data after decompression.

DECOM_MGNUM

Address: Operational Base (0x2AC30000) + offset (0x003C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	MGNUM Magic number of LZ4 is 0x184D2204. If the MGNUM is not 0x184D2204, a magic number error(mn_err) will be generated. And DECOM will stop decompressing.

DECOM_FRAME

Address: Operational Base (0x2AC30000) + offset (0x0040)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RO	0x00	HCC Header checksum byte. One-byte checksum of combined descriptor fields, including optional ones. The value is the second byte of xxh32() using zero as a see, and the full frame descriptor as an input (including optional fields when they are present). A wrong checksum indicates an error in the descriptor. Header checksum is informational and can be skipped. The header checksum check function can be enabled by controlling the HCEN enable signal in the CTRL register. After being turned on, DECOM calculates the hash32 check value based on the data of the frame descriptor part of the LZ4 compressed file, and performs the header checksum byte in the file. In contrast, if they are not equal, an HCC error will be generated and an interrupt will be generated.
15:8	RO	0x00	BD BD byte. Including Block Maximum Size information. This information is useful to help the decoder allocate memory. Size here refers to the original(uncompressed) data size.
7:6	RO	0x0	VN_NUM Version number. 2-bits field, must be set to 2'b01. Any other value cannot be decoded by this version of the specification. If the version number is error, Version number error(VNE) will be generated.
5	RO	0x0	BCC_FLG Block checksum flag. If this flag is set, each data block will be followed by a 4-bytes checksum, calculated by using the xxHash-32 algorithm on the raw (compressed) data block. The intention is to detect data corruption (storage or transmission errors) immediately, before decoding. Block checksum usage is optional.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
4	RO	0x0	BIND_FLG Block independence flag. If this flag is set to "1", blocks are independent. If this flag is set to "0", each block depends on previous ones (up to LZ4 window size, which is 64 KB). In such case, it's necessary to decode all blocks in sequence. Block dependency improves compression ratio, especially for small blocks. On the other hand, it makes random access or multi-threaded decoding impossible. For debugging.
3	RO	0x0	CS_FLG Content size flag. If this flag is set, the uncompressed size of data included within the frame will be present as an 8 bytes unsigned little endian value, after the flags. Content size usage is optional.
2	RO	0x0	CCC_FLG Content checksum flag. If this flag is set, a 32-bits content checksum will be appended after the EndMark.
1	RO	0x0	reserved
0	RO	0x0	DICT_FLG Dictionary ID flag. If this flag is set, a 4-bytes Dict-ID field will be present, after the descriptor flags and the Content Size. If this flag is set, Dictionary ID error will be generated. DECOM will stop decompressing.

DECOM_DICTID

Address: Operational Base (0x2AC30000) + offset (0x0044)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	DICTID Dictionary ID in the compressed file header. Dictionary ID is only present if the DID_FLG is set. It works as a kind of "known prefix" which is used by both the compressor and the decompressor to "warm-up" reference tables.

DECOM_CSL

Address: Operational Base (0x2AC30000) + offset (0x0048)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	CSL Content size(CS) lower 32-bits. (Unit:byte) CS[63:0] is the original(uncompressed) size. This information is optional in LZ4 file header, and only present if CS_FLG is set. CS[63:0]={CSH, CSL};

DECOM_CSH

Address: Operational Base (0x2AC30000) + offset (0x004C)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RO	0x0	CSH Content size(CS) upper 32-bits.

DECOM_LMTSL

Address: Operational Base (0x2AC30000) + offset (0x0050)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:0	RW	0xffffffff	LMTSL Limit size of decompressed data lower 32bits. (Unit:byte) When the amount of decompressed data is greater than the LMTS, DSOLI interrupt is generated and the decompression process is stopped.

DECOM_LMTSH

Address: Operational Base (0x2AC30000) + offset (0x0054)

Bit	Attr	Reset Value	Description
31:0	RW	0xffffffff	LMTSH Limit size of decompressed data higher 32bits.

DECOM_GZFHD

Address: Operational Base (0x2AC30000) + offset (0x0058)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RO	0x0	GZFHD GZIP/ZLIB file header information. When GZIPM = 1, GZFHD is GZIP file header information. When ZLIBM = 1, GZFHD is ZLIB file header information.

DECOM_VERSION

Address: Operational Base (0x2AC30000) + offset (0x00F0)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000926	VERSION Version number = 32'h2021_1216.

5.5 Application Notes

- After configuring the decompression mode and other decompression parameters, configure the decompression enable register ENR
- When the decompression is not completed, setting ENR from 1 to 0 will force the decompression process to stop and DECOM will return to the IDLE state. Need to reconfigure and enable DECOM to start the next decompression
- When an error is encountered in the decompression, DECOM will immediately stop the decompression process, set the relevant status register, and generate the corresponding interrupt
- After the decompression process is stopped, ENR will automatically change to 0
- After the decompression process is stopped, DSI will be set to 1. If DSIEN is 1, an interrupt will be generated; if DSIEN is 0, no interrupt will be generated
- After the decompression process is stopped, COMPLETE (DECOM_STAT[0]) is not set to 1 if there is an error in the decompression process; COMPLETE is set to 1 only when the decompression is complete and there are no errors

Chapter 6 Video Capture (VICAP)

6.1 Overview

The Video Capture, receives the data from Camera via MIPI or DVP, and transfers the data into system main memory by AXI bus or transfers the data into ISP.

- Support BT.601 RAW8/10/12 YCbCr 422 8-bit input
- Support BT.656 YCbCr 422 8-bit progressive/interlaced input
- Support 16-pins BT.1120 YCbCr 422 8-bit progressive/interlaced input
- Support 2/4 mixed BT.656/BT.1120 YCbCr 422 input
- Support dual-edge sampling for BT.656/BT.1120
- Support receiving five groups of MIPI CSI interfaces, up to four IDs for each group
- Support VC/DT configurable for each ID
- Support ten MIPI CSI data formats: RAW8/10/12/14/16, RGB888, YUV422 8bit, YUV422 8bit interlaced, YUV420 8bit, Legacy YUV420 8bit
- Support three modes of MIPI CSI HDR: virtual channel mode, identification code mode, line counter mode
- Support window cropping
- Support 8/16/32 times down-sampling for RAW data
- Support RAW 2x2 binning
- Support pixel extraction from 2x2 pattern
- Support UV mean down-sampling for YUV422
- Support reducing frame rate
- Support compact/non-compact output format for RAW data
- Support NV16/NV12/YUV400/YUYV output format for YUV data
- Support virtual stride when write to DDR
- Support DMA burst gather 2/4/8
- Support MMU
- Support QOS(hurry/press)
- Support sending RAW data directly to ISP
- Support soft reset, auto-reset when DMA error
- Support debug mode

6.2 Block Diagram

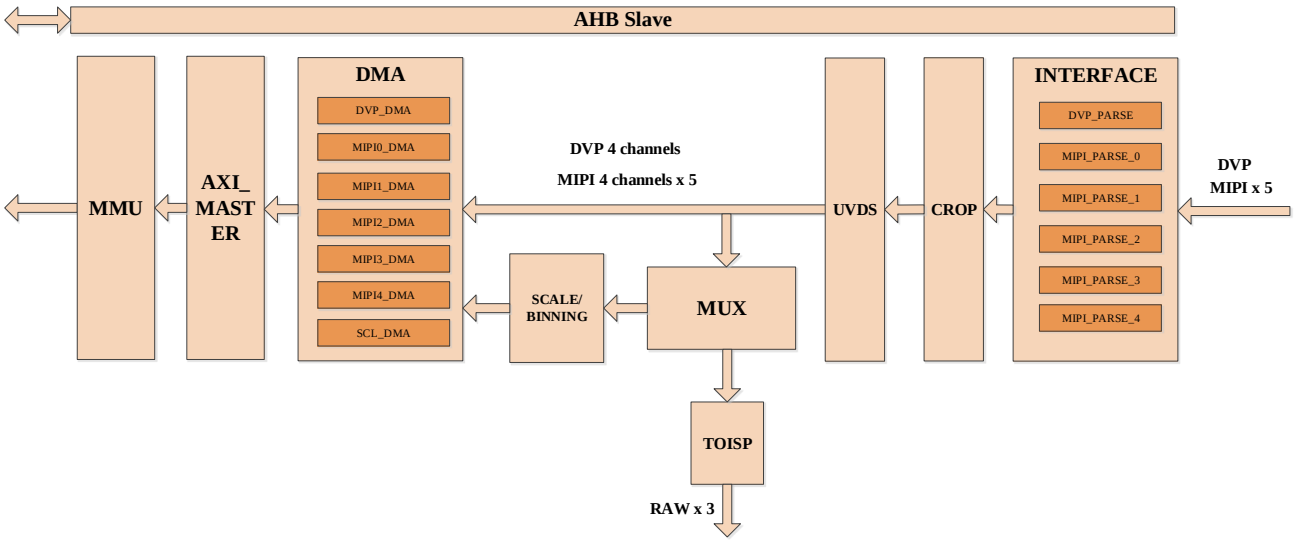

Fig. 6-1 VICAP Block Diagram

VICAP comprises with:

- AHB Slave
- AXI Master
- MMU
- INTERFACE
- CROP

Copyright © 2024 Rockchip Electronics Co., Ltd.

- UVDS
- SCALE/BINNING
- TOISP
- DMA

6.3 Function Description

6.3.1 Interface

Translate the input video data into the requisite data format

- DVP BT.656/BT.1120 format

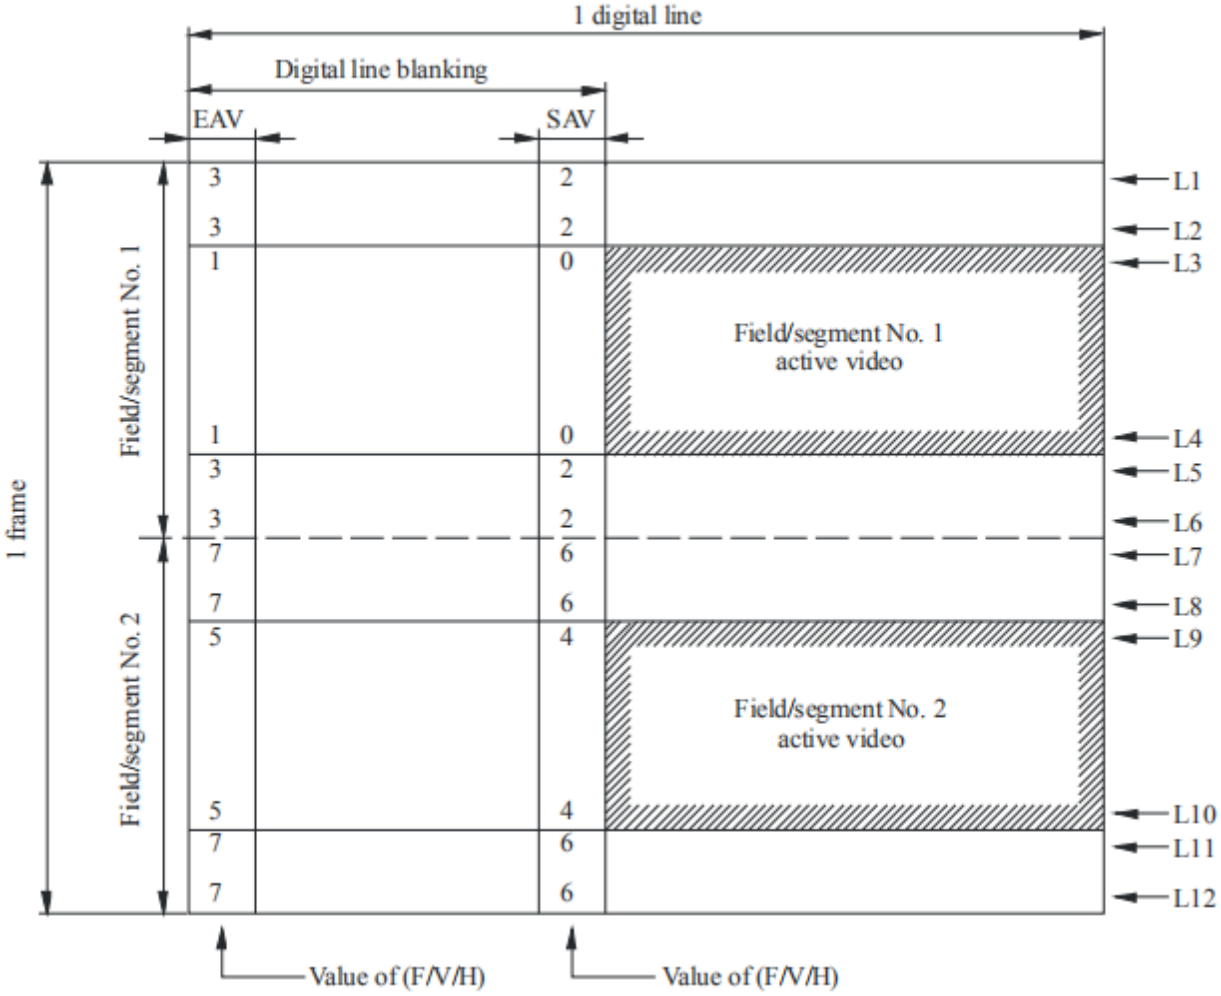

Fig. 6-2 BT656/BT1120 interlace timing relationship

Copyright © 2024 Rockchip Electronics Co., Ltd.

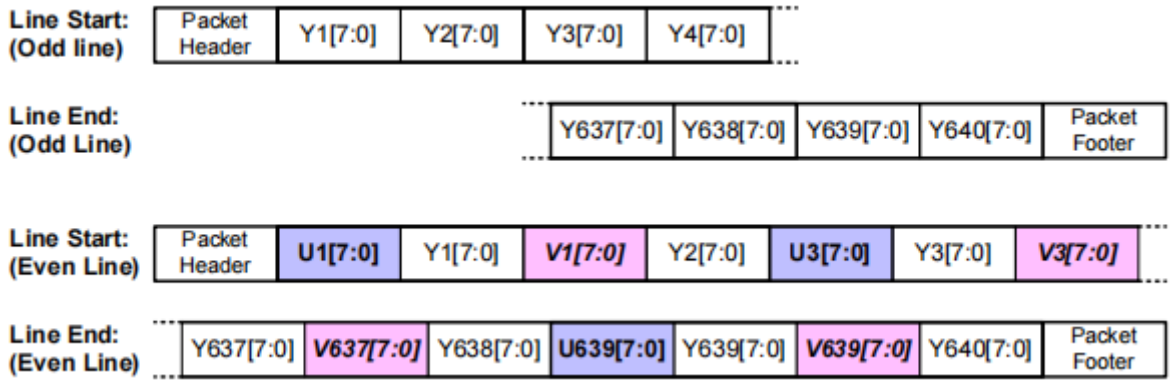

Fig. 6-13 MIPI CSI YUV420 format

- MIPI CSI Legacy YUV420 format

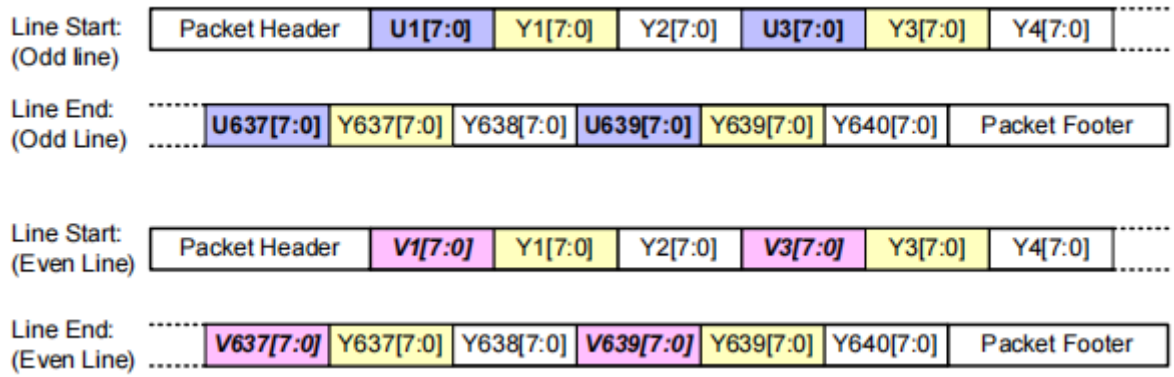

Fig. 6-14 MIPI CSI Legacy YUV420 format

6.3.2 Crop

Bypass or crop the source video data to a smaller size destination.

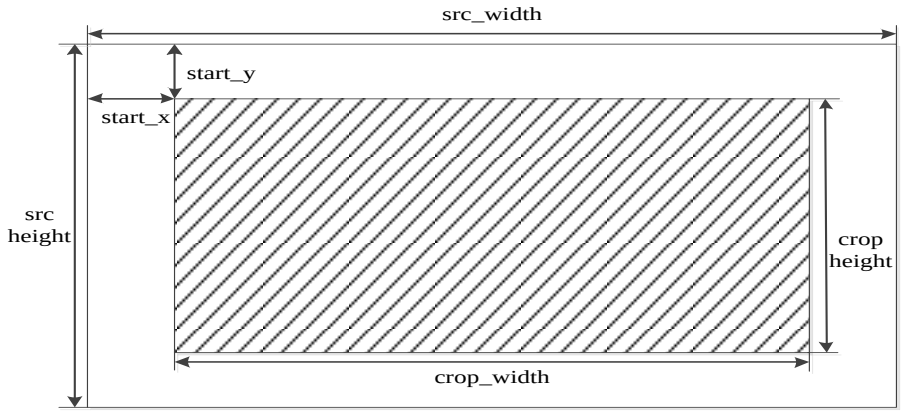

Fig. 6-15 Crop

6.3.3 Scale

Scale down for RAW data:

Copyright © 2024 Rockchip Electronics Co., Ltd.

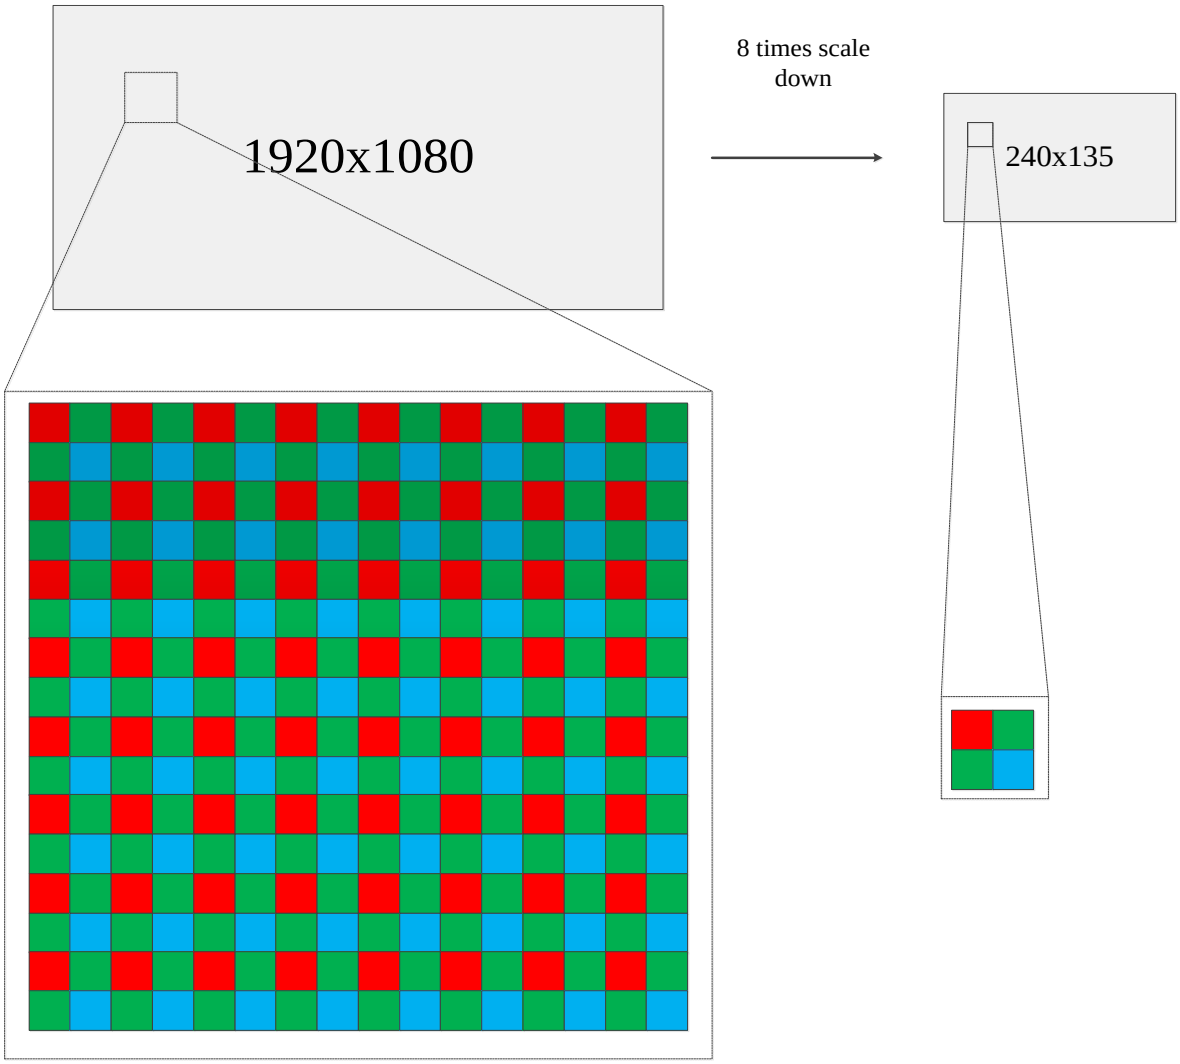

Fig. 6-16 8 times Scale down

RAW data 2x2 binning:

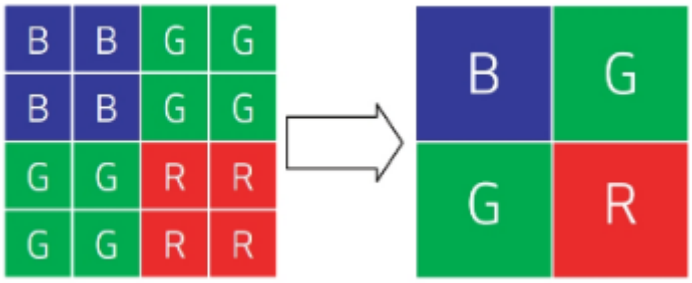

Fig. 6-17 RAW 2x2 binning

6.3.4 UVDS

UV mean downsampling for YUV422:

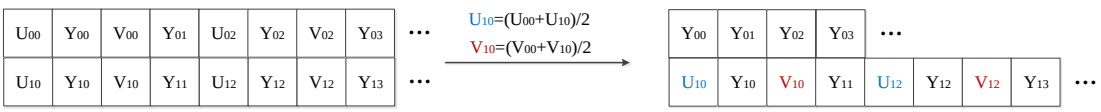

Fig. 6-18 convert yuv422 to yuv420 by UVDS

6.3.5 Toisp

The parsed video data can go straight to ISP for real-time processing.

6.3.6 DMA

The DMA is used to transfer the data from crop module to the AXI master block which will

Copyright © 2024 Rockchip Electronics Co., Ltd.

send the data to the AXI bus.

- NV16

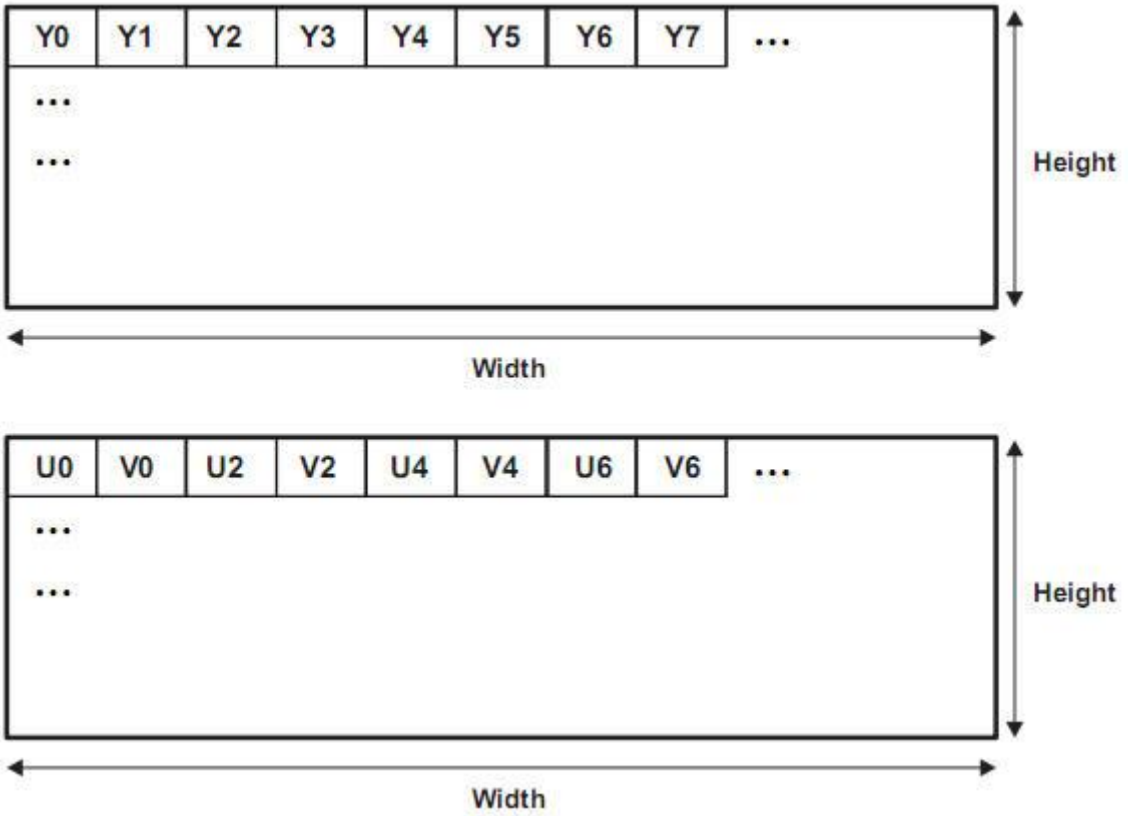

Fig. 6-19 NV16

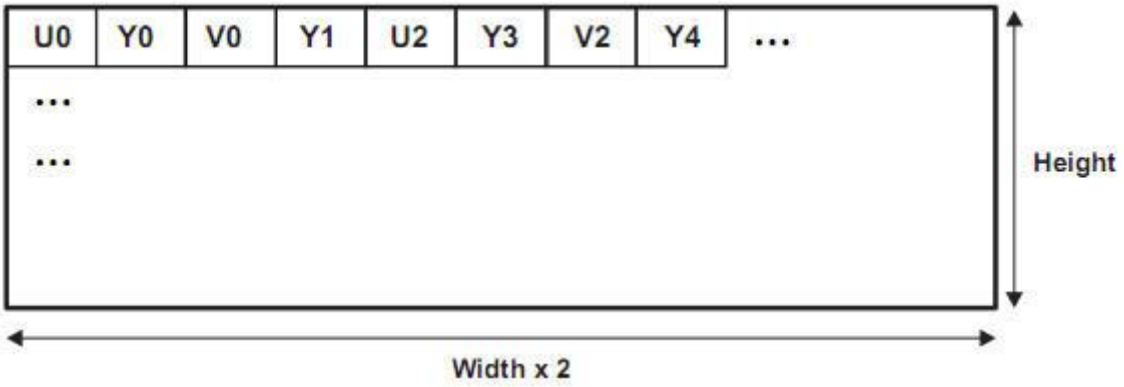

Fig. 6-22 YUYV

- Compact RAW

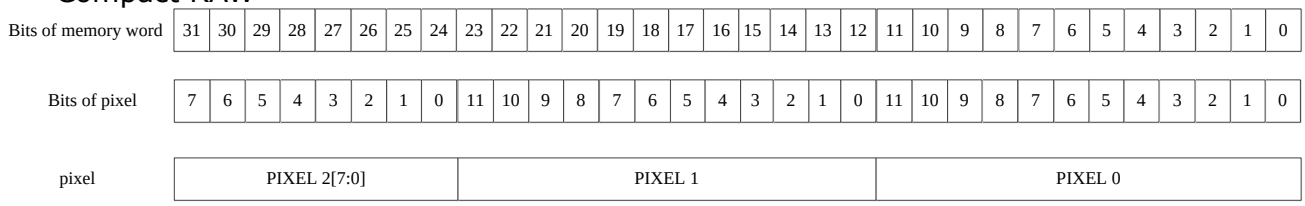

Fig. 6-23 Compact RAW12

- Noncompact RAW

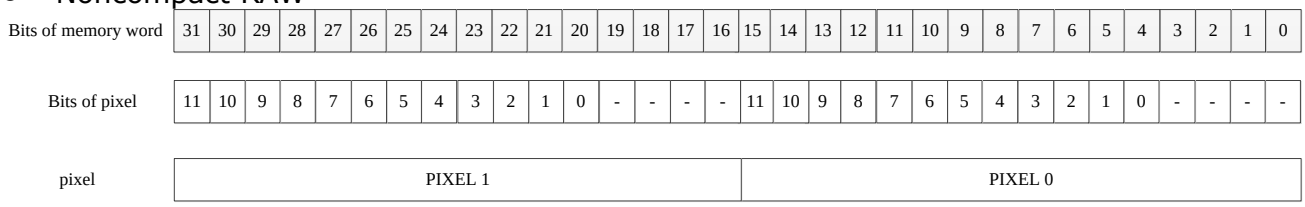

Fig. 6-24 noncompact RAW12(high align)

6.3.7 AXI Master

Transmit the data to chip memory via the AXI Master.

6.3.8 MMU

Map the virtual address to physical address.

6.3.9 AHB Slave

Host configure the registers via the AHB Slave.

6.4 Register Description

6.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

Table 6-1 VICAP Address Mapping

Copyright © 2024 Rockchip Electronics Co., Ltd.

Base Address[11:8]	Device	Address Length	Offset Address Range
4'b0000	Global/DVP	256 BYTE	0x0000 ~ 0x00ff
4'b0001	MIPI0	512 BYTE	0x0100 ~ 0x01ff
4'b0011	MIPI1	512 BYTE	0x0300 ~ 0x03ff
4'b0100	MIPI2	512 BYTE	0x0400 ~ 0x04ff
4'b0101	MIPI3	512 BYTE	0x0500 ~ 0x05ff
4'b0110	MIPI4	512 BYTE	0x0600 ~ 0x06ff
4'b0111	Scale/TOISP	256 BYTE	0x0700 ~ 0x07ff
4'b1000	MMU	256 BYTE	0x0800 ~ 0x08ff

6.5 Registers Summary

Name	Offset	Size	Reset Value	Description
VICAP_GLB_CTRL	0x0000	W	0x8001FE61	VICAP global control
VICAP_GLB_INTEN	0x0004	W	0x00000000	VICAP global interrupt enable.
VICAP_GLB_INTST	0x0008	W	0x00000000	VICAP global interrupt status.
VICAP_GLB_TOLE	0x000C	W	0x00000000	Enable/Status for ddr freq int
VICAP_DVP_CTRL	0x0010	W	0x00000000	DVP path control
VICAP_DVP_INTEN	0x0014	W	0x00000000	DVP path interrupt status

6.5.1 Detail Registers Description

VICAP_GLB_CTRL

Address: Operational Base(0x27C10000) + offset (0x0000)

Bit	Attr	Reset Value	Description
31	RO	0x1	ro_axi_idle 1'b0: AXI is working 1'b1: AXI is idle.
30:27	RO	0x0	reserved
26	RW	0x0	sw_dphy2_2x2lane_en 1'b0: DPHY 4lane mode 1'b1: DPHY 2x2lane mode.
25	RW	0x0	sw_dphy1_2x2lane_en 1'b0: DPHY 4lane mode 1'b1: DPHY 2x2lane mode.
24:20	RO	0x00	reserved
19	RW	0x0	sw_acs_isp_c_dis 1'b0: Enable isp coreclk acs signal out 1'b1: Disable isp coreclk acs signal out.
18	RW	0x0	sw_acs_a_dis 1'b0: Enable aclk acs signal out 1'b1: Disable aclk acs signal out.
17	RW	0x0	sw_int_mode 1'b0: sw_intst=sw_inten&sw_intst_raw 1'b1: sw_intst=sw_intst_raw.
16	RW	0x1	sw_dma_adapt_en 1'b0: Disable dma self-adapt(dma will transport data according the configured height) 1'b1: Enable dma self-adapt(dma will transport data according the actual height).
15:13	RW	0x7	sw_press_value Press value.
12	RW	0x1	sw_press_en 1'b0: Disable press 1'b1: Enable press
11:9	RW	0x7	sw_hurry_value Hurry value.
8	RW	0x0	sw_hurry_en 1'b0: Disable hurry 1'b1: Enable hurry

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
7:6	RW	0x1	sw_dma_group_mode 2'b00: Group 2 (2 bursts gather) 2'b01: Group 4 (4 bursts gather) 2'b10: Group 8 (8 bursts gather) 2'b11: Group 8 (8 bursts gather) This register is valid when sw_dma_group_en=1.
5	RW	0x1	sw_dma_group_en 1'b0: Disable dma burst group 1'b1: Enable dma burst group.
4	RW	0x0	sw_clk_gating_dis 1'b0: Enable the auto clk gating 1'b1: Disable the auto clk gating
3:2	RW	0x0	sw_soft_rst_mode 2'b00: Soft reset and protect toisp path frame integrity; 2'b01: Soft reset and protect toisp path frame integrity and pull down sw_cap_en automatically; 2'b10: Soft reset directly; 2'b11: Reserved.
1	RW	0x0	sw_soft_rst 1'b0: Not reset 1'b1: Reset the VICAP(except MMU/AXI MASTER/REG FILE)
0	RW	0x1	sw_cap_en 1'b0: Disable all interface capture 1'b1: Enable capture(still depends on sw_xxx_cap_en).

VICAP_GLB_INTEN

Address: Operational Base(0x27C10000) + offset (0x0004)

Bit	Attr	Reset Value	Description
31	RW	0x0	ddr_freq_inten Enable the interrupt of ddr frequency conversion. 1'b0: Disable 1'b1: Enable
30:11	RO	0x00000	reserved
10	RW	0x0	toisp0_fifo_overflow_inten Enable the interrupt of fifo overflow of TOISP0 path. 1'b0: Disable 1'b1: Enable
9	RW	0x0	frame_end_toisp0_ch2_inten Enable the interrupt of frame end for TOISP0 channel2. 1'b0: Disable 1'b1: Enable
8	RW	0x0	frame_end_toisp0_ch1_inten Enable the interrupt of frame end for TOISP0 channel1. 1'b0: Disable 1'b1: Enable
7	RW	0x0	frame_end_toisp0_ch0_inten Enable the interrupt of frame end for TOISP0 channel0. 1'b0: Disable 1'b1: Enable
6	RW	0x0	frame_start_toisp0_ch2_inten Enable the interrupt of frame start for TOISP0 channel2. 1'b0: Disable 1'b1: Enable

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
5	RW	0x0	frame_start_toisp0_ch1_inten Enable the interrupt of frame start for TOISP0 channel1. 1'b0: Disable 1'b1: Enable
4	RW	0x0	frame_start_toisp0_ch0_inten Enable the interrupt of frame start for TOISP0 channel0. 1'b0: Disable 1'b1: Enable
3	RW	0x0	dma_fifo_overflow_scl_ch0_inten Enable the interrupt of dma fifo overflow of scale path CH0. 1'b0: Disable 1'b1: Enable
2	RW	0x0	frame1_dma_end_scl_ch0_inten Enable the interrupt of end of odd frame for scale CH0. 1'b0: Disable 1'b1: Enable
1	RW	0x0	frame0_dma_end_scl_ch0_inten Enable the interrupt of end of even frame for scale CH0. 1'b0: Disable 1'b1: Enable
0	RW	0x0	axi0_bus_err_inten Enable the interrupt of axi0 bus error. 1'b0: Disable 1'b1: Enable

VICAP_GLB_INTST

Address: Operational Base(0x27C10000) + offset (0x0008)

Bit	Attr	Reset Value	Description
31	W1C	0x0	ddr_freq_intst 1'b0: No interrupt 1'b1: Interrupt
30:11	RO	0x00000	reserved
10	W1C	0x0	toisp0_fifo_overflow_intst 1'b0: No interrupt 1'b1: Interrupt
9	W1C	0x0	frame_end_toisp0_ch2_intst 1'b0: No interrupt 1'b1: Interrupt
8	W1C	0x0	frame_end_toisp0_ch1_intst 1'b0: No interrupt 1'b1: Interrupt
7	W1C	0x0	frame_end_toisp0_ch0_intst 1'b0: No interrupt 1'b1: Interrupt
6	W1C	0x0	frame_start_toisp0_ch2_intst 1'b0: No interrupt 1'b1: Interrupt
5	W1C	0x0	frame_start_toisp0_ch1_intst 1'b0: No interrupt 1'b1: Interrupt
4	W1C	0x0	frame_start_toisp0_ch0_intst 1'b0: No interrupt 1'b1: Interrupt

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
3	W1C	0x0	dma_fifo_overflow_scl_ch0_intst 1'b0: No interrupt 1'b1: Interrupt
2	W1C	0x0	frame1_dma_end_scl_ch0_intst 1'b0: No interrupt 1'b1: Interrupt
1	W1C	0x0	frame0_dma_end_scl_ch0_intst 1'b0: No interrupt 1'b1: Interrupt
0	W1C	0x0	axi0_bus_err_intst 1'b0: No interrupt 1'b1: Interrupt

VICAP_GLB_TOLE

Address: Operational Base(0x27C10000) + offset (0x000C)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27	RO	0x0	ro_mipi4_buffer_stat MIPI4 path buffer flag.
26	RO	0x0	ro_mipi4_vblank_stat MIPI4 path vblank flag.
25	RO	0x0	ro_mipi3_buffer_stat MIPI3 path buffer flag.
24	RO	0x0	ro_mipi3_vblank_stat MIPI3 path vblank flag.

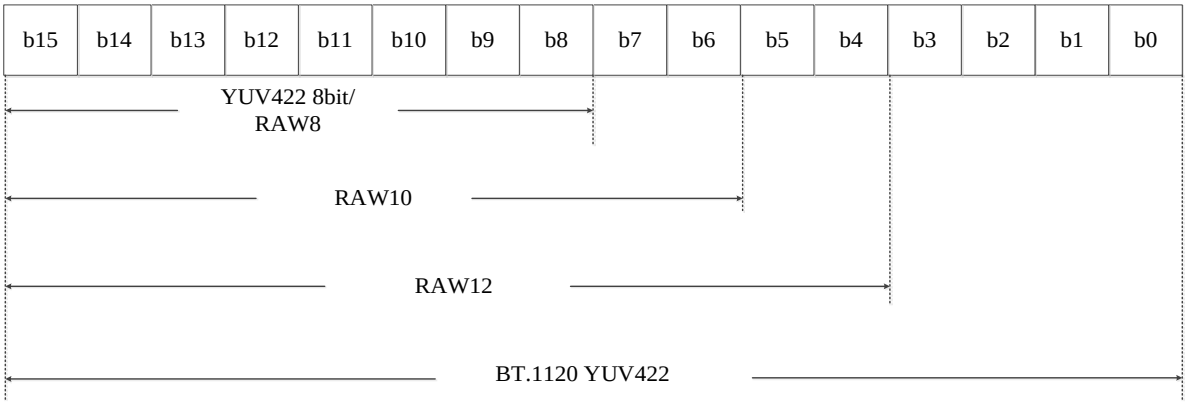
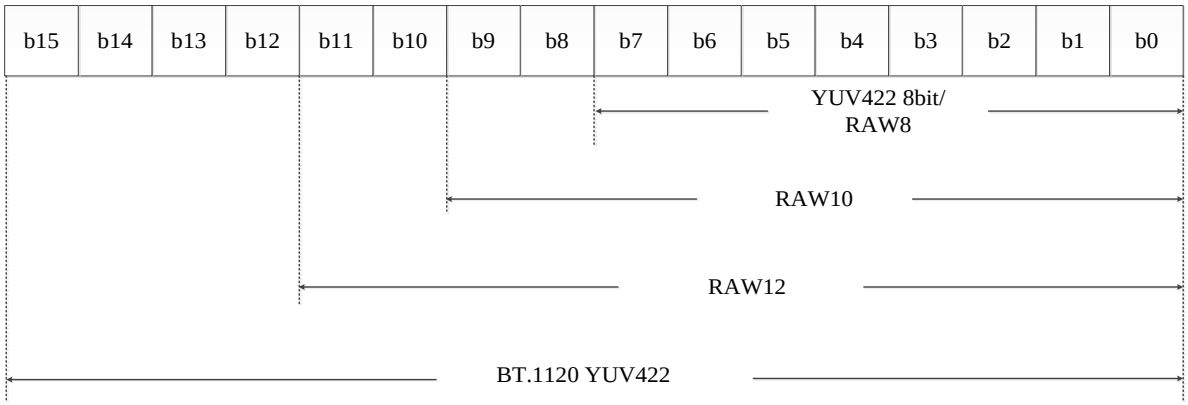
Notes: I=input, O=output, I/O=input/output, bidirectional



Furthermore, different IOs are selected and connected to different flash interface, which is shown as follows.

6.7 Application Notes



6.7.1 DVP Interface

- The MSB 4 bits of SAV/EAV of BT.656/BT.1120 are configurable, and the default values of SAV/EAV abide by the agreement.
- User can read the register of ro_sync_header_0~ro_sync_header_7 to obtain the recent 8 SAV/EAV.
- The register sw_yuyv_in_order should be configured correctly. In the BT.1120 case 2'h0/2'h2 are the same for UV sequence and 2'h1/2'h3 are the same for VU sequence.
- In the dual-edge sampling case, the VCCIO_IOC_MISC_CON1[9] must be set to 1, and the register sw_dualedge_en must be set to 1. The clock phase could be adjusted by setting the VCCIO_IOC_MISC_CON1[6:0].
- User could invert the DVP interface clk by the register VCCIO_IOC_MISC_CON1[8].
- The default data arrangement is high alignment, and user could change to low alignment by the register sw_low_align_en.

Copyright © 2024 Rockchip Electronics Co., Ltd.

high alignment

low alignment

6.7.2 MIPI Interface

- The register sw_crop_en is suggested to be set to 1. The register sw_width/sw_start_x should be aligned to 4.
- In the sony identification code hdr mode, the register sw_sony_effect_code0/1 should be configured correctly according to the camera manual.
- In the line counter hdr mode, the register sw_on_pad_value should be configured correctly according to the camera manual.
- In the VC hdr mode, the register sw_vc_hdr_protect is suggested to be set to 1, and the register sw_vc_hdr_id_main should be configured as the first coming id that is the long exposure frame id.
- The register sw_cap_en_idx is recommended for static configuration, and the register sw_cap_en is recommended for dynamic configuration.
- The MIPI interface can receive DSI data, but there are following restrictions on DSI TX: (1) one row of data could not be split into multiple long packets; (2) multiple packets could not be concatenated within a single HS transmission.

6.7.3 UV Mean Down Sampling

- Only ID0 support UV mean down sampling for all interfaces.
- The register sw_uvds_en is valid only when the register sw_wrddr_type=0x5.
- Support 4K(DVP)+4K(MIPI0)+4K(MIPI1/MIPI2)+4K(MIPI3/MIPI4) or 4K(DVP)+4K(MIPI0)+2K(MIPI1)+2K(MIPI2)+2K(MIPI3)+2K(MIPI4)
- UV mean down sampling for DVP interface and scale down function(raw scale/binning) are mutually exclusive.

Copyright © 2024 Rockchip Electronics Co., Ltd.

6.7.4 Scale down

- 2x2 raw binning function could convert the 4 cell pattern to normal bayer pattern. And the resolution is a quarter of what it was before.
- 2x2 pixel extraction function could extract one pixel from 2x2 bayer pattern. User needs to configure sw_scl_site correctly.
- The register sw_scl_chx_black_00/01/10/11 is the black level value for bayer pattern 00/01/10/11 position.
- The bit width of scale down output data is 16. When the max bit width of the scale down output data exceed 16, output data will be clipped. For example, 8 times scale down for RAW12, the bit width is 18, then the result will be clipped to 16 bits.
- When the width is not a multiple of double scale down times,then the result will be rounded up to an integer. For example, the image width is 4656 and 32 times scaling down is performed, the result width equals to ceil(4656/64)*2.
- When the height is not a multiple of double scale down times, then the result will be rounded down to an integer. For example, the image height is 1080 and 8 times scaling down is performed, the result height equals to floor(1080/16)*2.
- The registers sw_scl_en/sw_scl_mode/sw_scl_mux/sw_scl_times/sw_scl_site could be changed in the middle of the frame.

6.7.5 TOISP

- The register sw_width/sw_start_x should be aligned to 4.
- Only channel 0 need be enabled for linear case.
- Channel 0/1 need be enabled for HDR2 case, and channel 0 must be short exposure frame.
- Channel 0/1/2 need be enabled for HDR3 case, and channel 0 must be short exposure frame, channel 1 must be medium exposure frame, channel 2 must be long exposure frame.
- The register sw_toisp0_en_chx could be switched in the middle of the frame.

6.7.6 DMA

- The start address/virtual stride should be aligned to 8 at least. And being aligned to 64 is good for DDR.
- User could shut down DMA transferring by setting the register sw_dma_en to 0.
- User could set sw_hurry_en/sw_press_en to 1 for dynamic adjusting the priority of VICAP. And the register sw_water_line is the triggering condition of pulling up hurry/press signal.
- The register sw_yuyv_out_order is effective when the register sw_wrddr_type is NV16/NV12/YUYV. And in the NV16/NV12 case, 2'h0/2'h2 are the same for UV sequence and 2'h1/2'h3 are the same for VU sequence.
- There are two modes for line counter interrupt.In one-time mode, if line_int_num =100, the line_intst will be 1 when receive 100th line. In circular mode, if line_int_num =100, the line_intst will be 1 when receive 100th line200th line300th line.....
- The DMA has two transfer strategies :1. transfer image according to the actual height of reception. 2. transfer image according to the configured height. Which strategy you choose depends the register sw_dma_adapt_en.
- If DPHY1 work in the 2x2lane mode, the register sw_dphy1_2x2lane_en must be configured to 1.
- If DPHY2 work in the 2x2lane mode, the register sw_dphy2_2x2lane_en must be configured to 1.
- The following table lists the write ddr types supported for each MIPI parse type.

parse_type wrddr_type	RAW-compact	RAW-uncompact	YUV packet	YUV400	NV16	NV12
RAW8	***Y***	***Y***	**--**	**--**	**--**	**--**

RAW10	***Y***	***Y***	***--***	***--***	***--***	***--***
RAW12	***Y***	***Y***	***--***	***--***	***--***	***--***
RAW14	***Y***	***Y***	***--***	***--***	***--***	***--***
RAW16	***Y***	***Y***	***--***	***--***	***--***	***--***
RGB888	***Y***	***--***	***--***	***--***	***--***	***--***
YUV422-8bit progress	***--***	***--***	***Y***	***Y***	***Y***	***Y***
YUV422-8bit interlace	***--***	***--***	***Y***	***Y***	***Y***	***Y***
YUV420-8bit	***--***	***--***	***--***	***Y***	***--***	***Y***
YUV420-8bit leagcy	***--***	***--***	***--***	***Y***	***--***	***Y***

- The following table lists the write ddr types supported for each DVP input mode.

input_mode wrddr_type	RAW-compact	RAW-uncompact	YUV packet	YUV400	NV16	NV12
BT.601 YUV422	***--***	***--***	***Y***	***Y***	***Y***	***Y***
BT.601 RAW	***Y***	***Y***	***--***	***--***	***--***	***--***
BT.656 YUV422	***--***	***--***	***Y***	***Y***	***Y***	***Y***
BT.1120 YUV422	***--***	***--***	***Y***	***Y***	***Y***	***Y***
SONY DVP RAW	***Y***	***Y***	***--***	***--***	***--***	***--***

6.7.7 Reset

- DMA will be auto-reset when DMA goes wrong, for example FIFO overflow. And DMA will transfer data from the next frame.
- DMA also could be soft-reset by the register sw_dma_rst.
- User could reset the entire data path (interface/dma) by setting the register sw_soft_rst to 1. And the scale/toisp module will be reset if the sw_scl_mux/sw_toisp_mux is setted to choose the path.

6.7.8 DDR Frequency Interrupt

- User needs to config the register sw_ddr_freq_cycle_num, which is dclk cycle number for ddr frequency conversion.
- User needs to config the register sw_xxx_vblank_en/sw_xxx_buffer_en to 1, if the xxx interface is working.(‘xxx’ represent DVP/MIPI0/MIPI1/MIPI2/MIPI3/MIPI4)

Copyright © 2024 Rockchip Electronics Co., Ltd.

6.7.9 Debug Mode

- All interfaces support debug mode. Users can configure the register sw_debug_en to make the corresponding module enter debug mode. And the CSI2HOST also need enter debug mode, if the module is MIPI.
- The register sw_dma_adapt_en must be configured to 0.
- The path ID0 is used for debug mode.
- The register sw_dualedge_en/sw_input_mode must be configured correctly in DVP debug mode.
- The register sw_wrddr_type must be configured to 0 in debug mode.
- The space of a frame is equal to sw_vlw*sw_height, so the register sw_vlw/sw_height needs to be configured.
- In DVP debug mode, one debug data occupies 16 bits, the data arrangement is shown in the figure below.

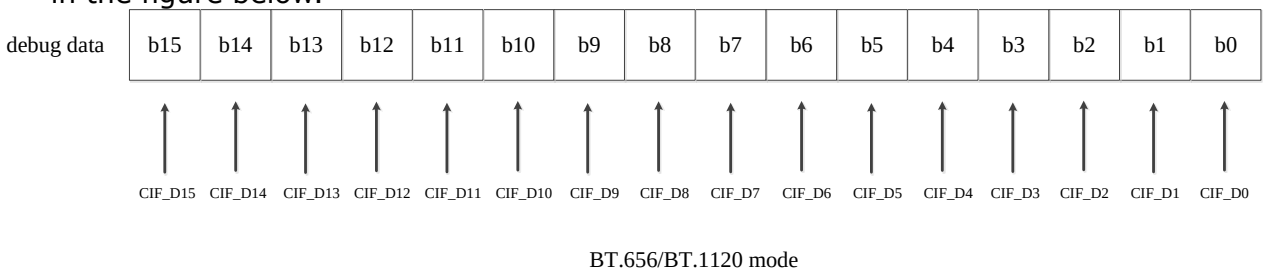


Fig. 6-25 DVP debug mode data arrangement

- In MIPI1/MIPI2/MIPI3/MIPI4 debug mode, one debug data occupies 48 bits, the data arrangement is shown in the figure below.

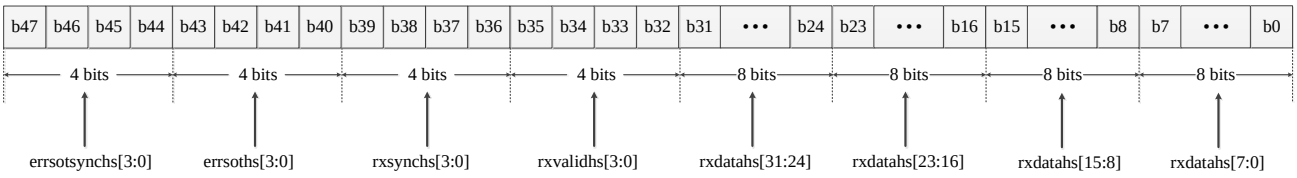

Fig. 6-26 MIPI1/2/3/4 debug mode data arrangement

- In MIPI0 debug mode, one debug data occupies 96 bits, the data arrangement is shown in the figure below.

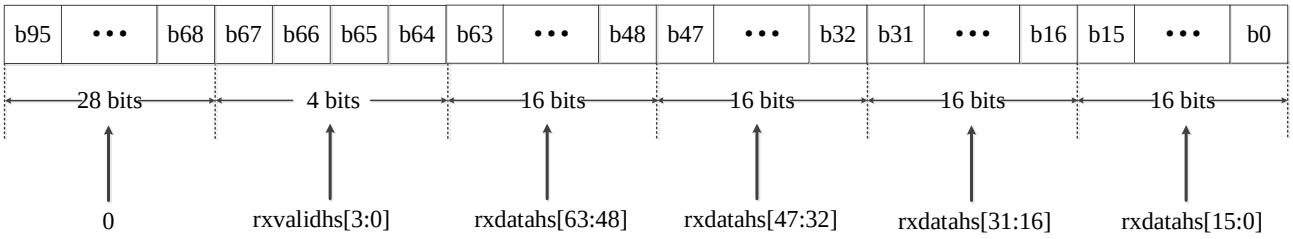

Fig. 6-27 MIPI0 debug mode data arrangement

Chapter 7 Dynamic Memory Interface (DMC)

7.1 Overview

The DMC includes LPDDR4/4X/5 controller (DDRCTL), DDRPHY, DDR monitor and DFI scramble, which are a complete memory interface solution for DDR memory subsystems. The DDRCTL SoC application bus interface supports AXI interface, with flexible address mapper logic allow application-specific mapping of row, column, bank, bank group and rank bits to achieve industry leading high-efficiency, low-latency and high-performance from memory interface.
The DDRPHY provides control features to ease the customer implementation of digitally controlled features of the PHY such as DQS clean, read training, write training, dvfs training, periodic training and programmable configuration controls.
The DMC supports the following features:

- Support LPDDR4/4X/5
- Support LPDDR4 protocol up to LPDDR4-4266 speed grade and LPDDR5 protocol up to LPDDR5-4800
- Support up to 2-channel interleaving with a maximum of 16GB capacity in total, 2 ranks for each channel
- Support scalable and software-controlled 1:2:2(LPDDR4/4X) or 1:1:2/1:1:4 (LPDDR5) frequency ratio
- Support 5 AXI ports which communicate between the SoC interconnect and DDRCTL
- Support 32-bit DDR data bus width for 2-channel interleaving
- Support up to 10 kinds of address mapping
- Support burst16 for LPDDR4/4X/5
- Support different CL/WL latency
- Support 16 bank mode and BG mode for LPDDR5
- Support open, close, intelligent pre-charge paging policy
- Support advance refresh control
- Support LPDDR4/4X/5 software controlled frequency change
- Support DFI PHY master interface
- Support MC-initiated requests and PHY-initiated requests interface
- Support DFI data low power and ctrl low power interface
- Support auto power-down or auto self-refresh power down when DDRCTL is idle for a period of time. The DDRCTL's core clock, DDRCTL's AXI clock and interconnect's AXI clock can be gated
- Support auto or SW issue entry or exit clock stop/power-down/self-refresh/deep sleep mode
- Software programmable Quality-of-Service (QoS) support
  - Three traffic classes on read commands—high priority reads, variable priority reads, and low priority reads
  - Two traffic classes on write commands—normal priority writes and variable priority writes
  - Port urgent and port throttling control
- Dynamic scheduling inside DDRCTL to optimize bandwidth and latency
- Support PMU controlled DDRPHY entry or exit IO retention mode
- Support scrambling and descrambling of data written to or read from DDR SDRAM
- Support DDR monitor for following features
  - AMBA 32-bit APB slave interface
  - Each DDR channel embedded with one DDR monitor module
  - Support to monitor DDR read or write address within 8GB address range for each channel
  - Support to observe whether DDR access address within a specified range
  - Support to do the following statistics during a programmed number of time through hardware mode or software mode
    - Statistics about DDR idle cycles
    - Statistics about SR/PD/CKSTOP/SRPD/DFI data low power/DFI ctrl low power

Copyright © 2024 Rockchip Electronics Co., Ltd.

for LPDDR4/4X
- Statistics about SR/PD/CKSTOP/SRPD/DFIDLP/DFICLP/DSM for LPDDR5
- Statistics about number of activate, read and write cycles for a designated rank or bank
- Statistics about number of activate, read and write cycles for all banks and ranks in one DDR channel
- Statistics about read to read, read to write, write to write and write to read page hit or page miss for a designated rank or bank

- Support monitor interrupt

7.2 Block Diagram

Following is the 2-channel interleaving DMC block diagram. The two DDR channels are the same.

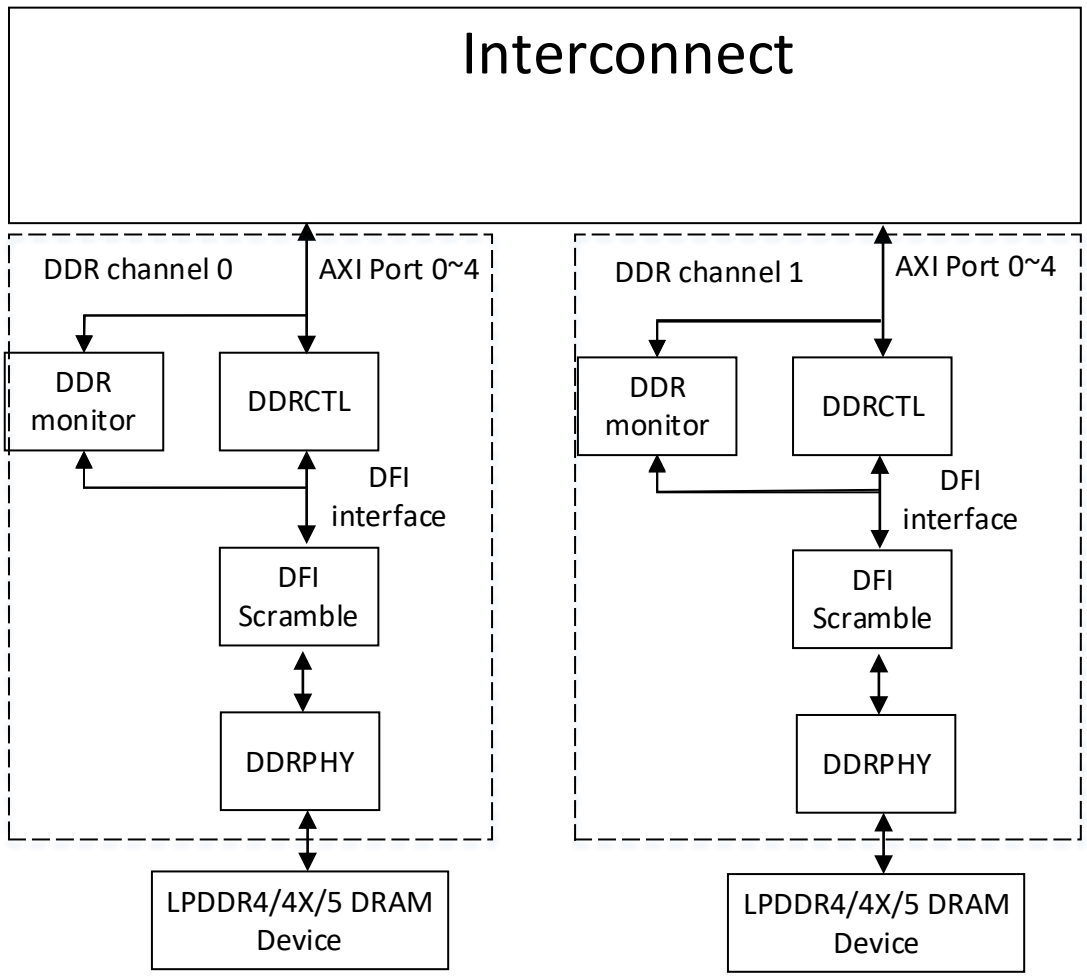

Fig. 7-1 DMC Block Diagram

Please refer to the other chapter for more information about interconnect.

7.3 Function Description

7.3.1 DDRCTL

DDRCTL supports 5 AXI Ports, it receives AXI transactions from interconnect directly. These transactions are queued internally and scheduled to the SDRAM while satisfying SDRAM protocol timing requirements. It in turn receives read data on the DFI interface from the DDRPHY block.

Copyright © 2024 Rockchip Electronics Co., Ltd.

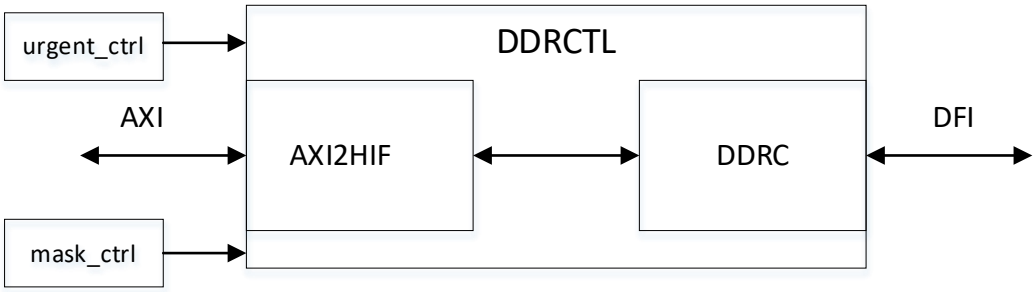

Fig. 7-2 DDRCTL Block Diagram

DDRCTL contains the following main components.

- AXI2HIF block: This block provides the AXI interfaces to system level and HIF interface to DDRC block. It provides bus protocol handling, data buffering, data bus size conversion and memory burst alignment. Read is stored in a read re-order buffer and return to the AXI Port.
- DDRC block: This block issues the read/write commands, carries out the DRAM page management, issues DRAM maintenance commands, and implement the DFI interface. Write data is stored in an SRAM until its associated command is issued to the PHY. Read data is handled by the response engine in the DDRC and is returned on the HIF.

To improve DDR performance in different scenarios, there are two modules named urgent_ctrl module and mask_ctrl module outside the DDRCTL.

7.3.1.1 urgent_ctrl

The function of urgent_ctrl module is to control the DDRCTL's awurgent_n/arurgent_n(n=0~4) per port according to the press_n or awqos_n/arqos_n(n=0~4) signals from interconnect module, as well as status signals such as raq_pop_n/waq_pop_n(n=0~4) from DDRCTL.

For a given AXI port, there is an embedded queue for each port inside urgent_ctrl module to store arqos or awqos respectively. The queue depth is 12. The arqos or awqos queue becomes urgent if there are commands in the queue and not popped for DDR_GRF_CHA/B_CON16.press_queue_wait_limit*4 cycles. The arqos_out and awqos_out is popped at the same time as DDRCTL internal AR FIFO and AW FIFO. The value of arqos_out, awqos_out and press signals are compared to select the maximum one as the QoS of a given AXI port. Then a port priority comparison module compares the QoS of 5 AXI ports and selects the port which has the largest QoS.

The arurgent is generated based on the following conditions.

- The port is selected by port priority comparison module.
- The arqos queue becomes urgent, arqos_out is largest of awqos_out, press and DDR_GRF_CHA/B_CON14.press_ar_th. If not, press should be larger than DDR_GRF_CHA/B_CON14.press_ar_th when arvalid is high and arready is low.
- When write is blocked by read (the awqos queue becomes urgent inside urgent_ctrl module but read port is granted by PA(Port Arbiter) inside DDRCTL and DDR_GRF_CHA/B_CON16.press_rdwr_order is set 1'b1).

The awurgent is generated based on the following conditions.

- The port is selected by port priority comparison module.
- The awqos queue becomes urgent, awqos_out is largest of arqos_out, press and DDR_GRF_CHA/B_CON14.press_aw_th. If not, press should be larger than DDR_GRF_CHA/B_CON14.press_aw_th when awvalid is high and awready is low.
- When read is blocked by write (the arqos queue becomes urgent inside urgent_ctrl module but write port is granted by PA inside DDRCTL and DDR_GRF_CHA/B_CON16.press_rdwr_order is set 1'b1).

7.3.1.2 mask_ctrl

This module is instantiated outside each DDRCTL to control the arurgent_0/arurgent_1/ arurgent_2, awurgent_0/awurgent_1/ awurgent_2 of DDRCTL. It also generates signals to mask read port and write port of PA to be not granted. Following is the block diagram of mask_ctrl module.

Copyright © 2024 Rockchip Electronics Co., Ltd.

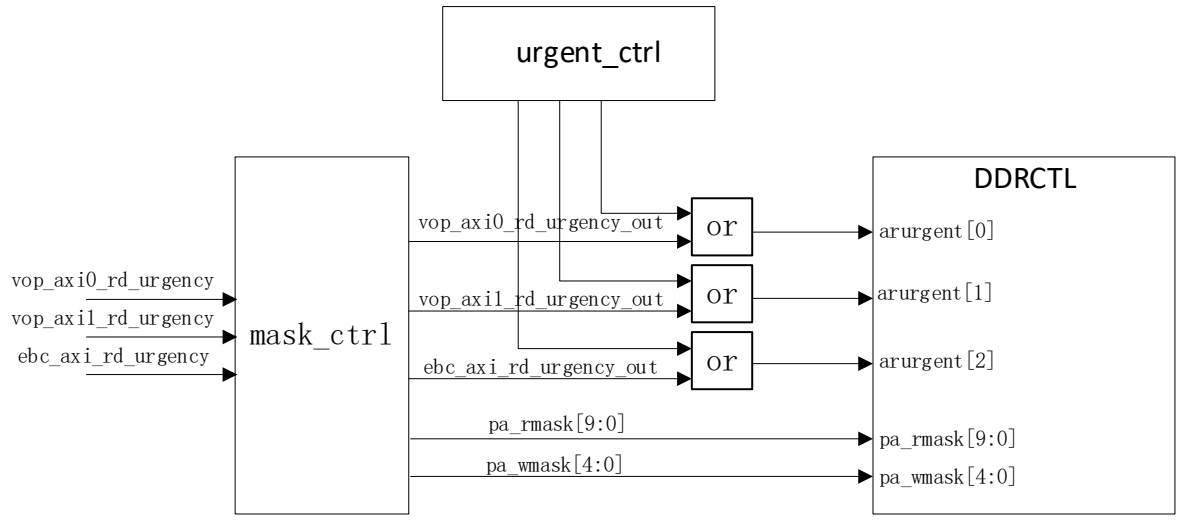

Fig. 7-3 Mask_ctrl Block Diagram

The input of mask_ctrl module is from VOP and EBC. Vop_axi0_rd_urgency means AXI read port0 of VOP becoming urgent, vop_axi1_rd_urgency means AXI read port1 of VOP becoming urgent and ebc_axi_rd_urgency means AXI read port of EBC becoming urgent. The output signals vop_axi0_rd_urgency_out, vop_axi1_rd_urgency_out and ebc_axi_rd_urgency_out are synchronize to the DDRCTL's core_ddrc_core_clk. If any of these three read urgency signals are pulled high, the mask_ctrl module will mask all the other AXI read ports and mask all the AXI write ports except the one that read port is urgent (If read/write ordered is enabled, the AXI write port can't be masked when the corresponding read port is urgent). For example, if vop_axi0_rd_urgency is high, the other two are low. Then write port of AXI port 1/2/3/4 are masked (Whether can be masked is controlled by DDR_GRF_CHA/CHB_CON18[4:1]), read port of AXI port 1/2/3/4 are masked(Whether can be masked is controlled by DDR_GRF_CHA/CHB_CON17[9:2]). Whether the write port of AXI port 0 can be masked depends on the DDR_GRF_CHA/CHB_CON18[0] and DDR_GRF_CHA/CHB_CON19[0].

7.3.2 DDRPHY

DDRPHY supports LPDDR4/4X/5 SDRAM and provides physical interface solutions for DDRCTL requiring access to JEDEC compatible SDRAM devices. It is optimized for low power and high speed (up to 4266Mbps for LPDDR4/4X and up to 4800Mbps for LPDDR5) applications with robust timing and small silicon area. The DDRPHY has fully digital DLL for 90° phase shift of strobe signal. DQS clean, read training, write training, dvfs training and periodic training are supported.

In order to support DDR fast frequency change, there are 2 PLLs in each DDR channel. D0APLL and D0BPLL are used to provide operation clock for DDRPHY channel 0, while D1APLL and D1BPLL are used for DDRPHY channel 1. The output clock of 2 PLLs in each channel are connected to the input of a multiplexer, the output of the multiplexer drives the DDRPHY source clock clk_phy2x. During DDR frequency change period, it just needs to switch to the other PLL that has locked before without waiting for PLL lock.

7.3.3 DFI Scramble

The function of DFI scramble module is to scramble data written to DDR SDRAM and descramble data read from DDR SDRAM. This module is by default bypassed. If it is enabled, it receives data from DDRCTL through DFI interface, scramble written data and then send it to the DDRPHY. It also descrambles date received from DDRPHY and send it back to DDRCTL through DFI interface.

7.3.4 DDR Monitor

The DDR Monitor Module has four functions. The first function is used when debug, it will monitor the DDR read or write address within a specified range. The second function is used to do the statistics about DDR bandwidth and utilization. The third function is used to statistic special pattern for a designated bank or for all banks. The fourth function is used to statistic low power such as self-refresh, power down, self-refresh power down, clock stop and so on.

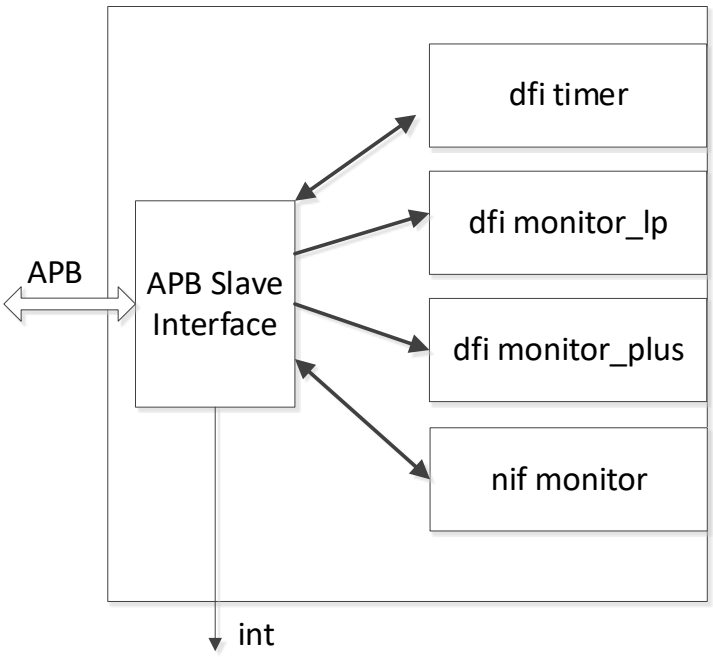

Fig. 7-4 DDR Monitor Block Diagram

The 5 AXI ports signals such as arready_n, arvalid_n, araddr_n[33:0], arid_n[7:0] and awready_n, awvalid_n, awaddr_n[33:0], awid_n[7:0](where n is 0~4) are input to the DDR Monitor. The host processor gets access to DDR Monitor Register Block through the APB slave interface, and the DDR Monitor can assert an active-high level interrupt to the host processor.

DDR Monitor does the monitor and statistics by dfi monitor_plus module, nif monitor module and dfi monitor_lp module. The dfi monitor_plus module is used to statistic DDR bandwidth, utilization and special pattern for a designated bank or for all banks. The nif monitor module is used to monitor DDR read or write address within a specified range. The dfi monitor_lp module is used to statistics low power.

7.4 Register Description

7.4.1 Internal Address Mapping For DDRCTL

Slave address can be divided into different length for different usage, which is shown as follows.

Operational Base

Name	Base Address
DDRCTL0	0x28000000
DDRCTL1	0x29000000

7.4.2 Registers Summary For DDRCTL

Name	Offset	Size	Reset Value	Description
DDRCTL_DRAMSET1TMG0_FREQ0	0x0000	W	0x0F101B0F	SDRAM Timing Register 0 belonging to Timing Set 1
DDRCTL_DRAMSET1TMG1_FREQ0	0x0004	W	0x00080414	SDRAM Timing Register 1 belonging to Timing Set 1
DDRCTL_DRAMSET1TMG2_FREQ0	0x0008	W	0x0305060D	SDRAM Timing Register 2 belonging to Timing Set 1
DDRCTL_DRAMSET1TMG3_FREQ0	0x000C	W	0x00040404	SDRAM Timing Register 3 belonging to Timing Set 1
DDRCTL_DRAMSET1TMG4_FREQ0	0x0010	W	0x05040405	SDRAM Timing Register 4 belonging to Timing Set 1
DDRCTL_DRAMSET1TMG5_FREQ0	0x0014	W	0x05050403	SDRAM Timing Register 5 belonging to Timing Set 1

7.4.3 Detail Registers Description For DDRCTL

Some register fields might use the following optional attributes.
Volatile: If true, indicates in the case of a write followed by read, or in the case of two consecutive reads, there is no guarantee as to what is returned by the read on the second transaction or that this return value is consistent with the write or read of the first transaction. The element implies there is some additional mechanism by which this field can acquire new values other than by reads/writes/resets. For example, when the controller updates the register field contents.
Testable: Possible values are unconstrained, untestable, readOnly, writeAsRead, restore. Untestable means that this field is untestable by a simple automated register test. For example, the read-write access of the register is controlled by a pin or another register. Read only means that you should not write to this register; only read from it. This might apply for a register that modifies the contents of another register.
The Programming Mode Field: The "Programming Mode" field in the description column of the register tables specifies the type of register. The DDRCTL registers belong to one of the following types.

- Static: Can be written only when the controller is in reset.
- Dynamic: Can be written at any time during operation.
- Quasi Dynamic: Can be written when the controller is in reset and some specific conditions outside reset. Please refer to the application notes for detailed information.

DDRCTL_DRAMSET1TMG0_FREQ0

Address: **Operational Base** + offset (0x0000)

Bit	Attr	Reset Value	Description
31:24	RW	0x0f	wr2pre Minimum time between write and precharge to same bank. Specifications: WL + BL/2 + tWR where: WL = write latency BL = burst length. This must match the value programmed in the BL bit of the mode register to the SDRAM. BST (burst terminate) is not supported at present. tWR = Write recovery time. This comes directly from the SDRAM specification. Add one extra cycle for LPDDR4/5 for this parameter. Unit: DRAM clock cycles. Value After Reset: 0xf Volatile: True Programming Mode: Quasi-dynamic Group 1, Group 2, Group 4

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
23:16	RW	0x10	t_faw tFAW: At most 4 banks must be activated in a rolling window of tFAW cycles. Unit: DRAM clock cycles. Value After Reset: 0x10 Volatile: True Programming Mode: Quasi-dynamic Group 2, Group 4
15:8	RW	0x1b	t_ras_max tRAS(max): Maximum time between activate and precharge to same bank. This is the maximum time that a page can be kept open t_ras_max must be set to RoundDown(tRAS(max)/tCK/1024). Unit: 1024 DRAM clock cycles. Value After Reset: 0x1b Volatile: True Programming Mode: Quasi-dynamic Group 2, Group 4
7:0	RW	0x0f	t_ras_min tRAS(min): Minimum time between activate and precharge to the same bank. Unit: DRAM clock cycles. Value After Reset: 0xf Volatile: True Programming Mode: Quasi-dynamic Group 2, Group 4

DDRCTL_DRAMSET1TMG1_FREQ0

Address: **Operational Base** + offset (0x0004)

Bit	Attr	Reset Value	Description
31:22	RO	0x000	reserved
21:16	RW	0x08	t_xp tXP: Minimum time after power-down exit to any operation. LPDDR4 (tCKELPD is defined in spec): larger of tXP and tCKELPD instead. LPDDR4 (tCKELPD is not defined in spec): tXP. LPDDR5: tXP + tCSH Unit: DRAM clock cycles. Value After Reset: 0x8 Volatile: True Programming Mode: Quasi-dynamic Group 2, Group 4
15:8	RW	0x04	rd2pre tRTP: Minimum time from read to precharge of same bank. LPDDR4 - BL/2 + max(RoundUp(tRTP/tCK),8) - 8 LPDDR5(BG mode): BL/n_min + RU(tRBTP/tCK) LPDDR5(16B mode): BL/n + RU(tRBTP/tCK) Unit: DRAM clock cycles. Value After Reset: 0x4 Volatile: True Programming Mode: Quasi-dynamic Group 1, Group 2, Group 4
7:0	RW	0x14	t_rc tRC: Minimum time between activates to same bank. Unit: DRAM clock cycles. Value After Reset: 0x14 Volatile: True Programming Mode: Quasi-dynamic Group 2, Group 4

DDRCTL_DRAMSET1TMG2_FREQ0

Copyright © 2024 Rockchip Electronics Co., Ltd.

Address: **Operational Base** + offset (0x0008)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30:24	RW	0x03	write_latency Set to WL Time from write command to write data on SDRAM interface. This must be set to WL. For all protocols, in addition to programming this register field, it is necessary to program DDRCTL_DFITMG0_FREQ0 and DDRCTL_DFITMG1_FREQ0 to control the read and write latencies Unit: DRAM clock cycles. Value After Reset: 0x3 Volatile: True Programming Mode: Quasi-dynamic Group 1, Group 2, Group 4
23	RO	0x0	reserved
22:16	RW	0x05	read_latency Set to RL Time from read command to read data on SDRAM interface. This must be set to RL. In addition to programming this register field, it is necessary to program DDRCTL_DFITMG0_FREQ0 and DDRCTL_DFITMG1_FREQ0 to control the read and write latencies Unit: DRAM clock cycles. Value After Reset: 0x5 Volatile: True Programming Mode: Quasi-dynamic Group 1, Group 2, Group 4
15:8	RW	0x06	rd2wr LPDDR4(DQ ODT is Disabled): RL + BL/2 + RU(tDQSCKmax/tCK) + WR_PREAMBLE + RD_POSTAMBLE - WL LPDDR4(DQ ODT is Enabled) : RL + BL/2 + RU(tDQSCKmax/tCK) + RD_POSTAMBLE - ODTLon - RD(tODTon(min)/tCK) + 1 LPDDR5 (BG mode && DQ ODT is Disabled): RL + BL/n_max + RU(tWCKDQO(max)/tCK) - WL LPDDR5 (BG mode && DQ ODT is Enabled) : RL + BL/n_max + RU(tWCKDQO(max)/tCK) + RD(tRPST/tCK) - ODTLon - RD(tODTon(min)/tCK) + 1 LPDDR5 (16B mode && DQ ODT is Disabled): RL + BL/n + RU(tWCKDQO(max)/tCK) - WL LPDDR5 (16B mode && DQ ODT is Enabled) : RL + BL/n + RU(tWCKDQO(max)/tCK) + RD(tRPST/tCK) - ODTLon - RD(tODTon(min)/tCK) + 1 Minimum time from read command to write command. Include time for bus turnaround and all per-bank, per-rank, and global constraints. Please see the relevant PHY databook for details of what must be included here. Where: WL = write latency BL = burst length. This must match the value programmed in the BL bit of the mode register to the SDRAM RL = read latency = CAS latency WR_PREAMBLE = 1 (1tCK write preamble), 2 (2tCK write preamble). RD_POSTAMBLE = 0.5 (0.5tCK read postamble), 1.5 (1.5tCK read postamble). After PHY has completed training the value programmed may need to be increased. Refer to relevant PHY documentation.

Bit	Attr	Reset Value	Description
			For LPDDR4, if derating is enabled (DDRCTL_DERATECTL0_FREQ0.derate_enable=1), derated tDQSCKmax must be used. Unit: DRAM clock cycles. Value After Reset: 0x6 Volatile: True Programming Mode: Quasi-dynamic Group 1, Group 2, Group 4
7:0	RW	0x0d	wr2rd LPDDR4: WL + BL/2 + tWTR + 1 LPDDR5(BG mode): WL + BL/n_max + RU(tWTR_L/tCK) LPDDR5(16B mode): WL + BL/n + RU(tWTR/tCK) Minimum time from write command to read command. Includes time for bus turnaround, recovery times, and all per-bank, per-rank, and global constraints. Please see the relevant PHY databook for details of what must be included here. Where: CWL = CAS write latency WL = Write latency PL = Parity latency BL = burst length. This must match the value programmed in the BL bit of the mode register to the SDRAM tWTR_L = internal write to read command delay for same bank group. This comes directly from the SDRAM specification. tWTR = internal write to read command delay. This comes directly from the SDRAM specification. After PHY has completed training the value programmed may need to be increased. Refer to relevant PHY documentation. Add one extra cycle for LPDDR4 operation. Unit: DRAM clock cycles. Value After Reset: 0xd Volatile: True Programming Mode: Quasi-dynamic Group 1, Group 2, Group 4

DDRCTL_DRAMSET1TMG3_FREQ0

Bit	Attr	Reset Value	Description
9:0	RW	0x003	dfi_t_ctrlup_min Specifies the minimum number of DFI clock cycles that the dfi_ctrlupd_req signal must be asserted. The DDRCTL expects the PHY to respond within this time. If the PHY does not respond, the DDRCTL will de-assert dfi_ctrlupd_req after dfi_t_ctrlup_min + 2 cycles. Lowest value to assign to this variable is 0x1. Unit: DFI clock cycles. Value After Reset: 0x3 Programming Mode: Static

DDRCTL_DFIUPDTMG1_FREQ0

Address: **Operational Base** + offset (0x05AC)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RW	0x01	dfi_t_ctrlupd_interval_min_x1024 This is the minimum amount of time between DDRCTL initiated DFI update requests (which is executed whenever the DDRCTL is idle). Set this number higher to reduce the frequency of update requests, which can have a small impact on the latency of the first read request when the DDRCTL is idle. Minimum allowed value for this field is 1. Unit: Multiples of 1024 DFI clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset: 0x01 Programming Mode: Static
15:8	RO	0x00	reserved
7:0	RW	0x01	dfi_t_ctrlupd_interval_max_x1024 This is the maximum amount of time between DDRCTL initiated DFI update requests. This timer resets with each update request; when the timer expires dfi_ctrlupd_req is sent and traffic is blocked until the dfi_ctrlupd_ackx is received. PHY can use this idle time to recalibrate the delay lines to the DLLs. The DFI controller update is also used to reset PHY FIFO pointers in case of data capture errors. Updates are required to maintain calibration over PVT, but frequent updates may impact performance. Minimum allowed value for this field is 1. Note: Value programmed for dfi_t_ctrlupd_interval_max_x1024 must be greater than dfi_t_ctrlupd_interval_min_x1024. Unit: Multiples of 1024 DFI clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset: 0x01 Programming Mode: Static

DDRCTL_DFIMSGTMG0_FREQ0

Address: **Operational Base** + offset (0x05B0)

Bit	Attr	Reset Value	Description

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
7:0	RW	0x04	dfi_t_ctrlmsg_resp This is the maximum amount in DFI clock cycles between the assertion of the dfi{0/1}_ctrlmsg_req signal to the assertion of the dfi{0/1}_ctrlmsg_ack signal. If the PHY does not acknowledge the request within dfi_t_ctrlmsg_resp cycles, the PHY must not acknowledge the request at all. In this case, the controller should de-assert the corresponding dfi{0/1}_ctrlmsg_req signal. The timing values might vary based on the frequency ratio and user must reprogram if there is any change in the frequency ratio. Refer to PHY databook for recommended values Unit: DFI clock cycles. Value After Reset: 0x4 Programming Mode: Static

DDRCTL_RFSHSET1TMG0_FREQ0

Address: **Operational Base** + offset (0x0600)

Bit	Attr	Reset Value	Description
31	RW	0x0	t_refi_x1_sel Specifies whether DDRCTL_RFSHSET1TMG0_FREQ0.t_refi_x1_x32 and DDRCTL_RFSHSET1TMG0_FREQ0.refresh_to_x1_x32 register values are x1 or x32. 1'b0: x32 register values are used. 1'b1: Register values are used. This applies only when per-bank refresh is enabled (DDRCTL_RFSHMOD0.per_bank_refresh=1). If per-bank refresh is not enabled, the x32 register values are used and this register field is ignored. This register field does not exist for configurations which do not support LPDDR4/5. For such configurations, the value of this register field can be assumed to be 0, so that DDRCTL_RFSHSET1TMG0_FREQ0.t_refi_x1_x32 and DDRCTL_RFSHSET1TMG0_FREQ0.refresh_to_x1_x32 are interpreted as x32 register fields Value After Reset: 0x0 Programming Mode: Dynamic - Refresh Related
30:28	RO	0x0	reserved
27:24	RW	0x2	refresh_margin Threshold value in number of DRAM clock cycles before the critical refresh or page timer expires. A critical refresh is to be issued before this threshold is reached. It is recommended that this not be changed from the default value, currently shown as 0x2. It must always be less than internally used t_refi/32. Note that internally used t_refi is equal to DDRCTL_RFSHSET1TMG0_FREQ0.t_refi_x1_x32 * 32 if DDRCTL_RFSHSET1TMG0_FREQ0.t_refi_x1_sel = 0. If DDRCTL_RFSHSET1TMG0_FREQ0.t_refi_x1_sel = 1, internally used t_refi is equal to DDRCTL_RFSHSET1TMG0_FREQ0.t_refi_x1_x32. Note that, internally used t_refi may be divided by four if derating or TCR is enabled. Unit: Multiples of 32 DRAM clock cycles. Value After Reset: 0x2 Programming Mode: Dynamic - Refresh Related
23:22	RO	0x0	reserved

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
21:16	RW	0x10	refresh_to_x1_x32 If the refresh timer has expired at least once (i.e. >tREFI period elapses, and there are postponed refreshes), then a speculative refresh may be performed. A speculative refresh is a refresh performed at a time when refresh would be useful. When there are no transactions pending in the CAM for a period of time determined by this DDRCTL_RFSHSET1TMG0_FREQ0.refresh_to_x1_x32 and the refresh timer has expired at least once since the last refresh, then a speculative refresh is performed. Speculative refreshes continues successively until there are no refreshes pending or until new reads or writes are issued to the DDRCTL. This is also used for non speculative refresh when LPDDR per-bank refresh (REFpb) is enabled. The controller observes the period of time determined by this for each bank, and a priority of bank address is determined. This should be programmed to tREFI based value in controller's current refresh mode. The controller calculates this according to current refresh mode. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. FOR PERFORMANCE ONLY. Unit: DRAM clock cycles or multiples of 32 DRAM clock cycles, depending on DDRCTL_RFSHSET1TMG0_FREQ0.t_refi_x1_sel. Value After Reset: 0x10 Programming Mode: Dynamic - Refresh Related
15:12	RO	0x0	reserved
11:0	RW	0x062	t_refi_x1_x32 Average time interval between refreshes per rank (See JEDEC specification for LPDDR4). Set this register to RoundDown(tREFI/tCK). If DDRCTL_RFSHSET1TMG0_FREQ0.t_refi_x1_sel = 0, divide the above result by 32 and round down. For LPDDR controller: If using all-bank refreshes (DDRCTL_RFSHMOD0.per_bank_refresh = 0), use tREFIab in the above calculations. If using per-bank refreshes (DDRCTL_RFSHMOD0.per_bank_refresh = 1), use tREFIpb in the above calculations. Note that: DDRCTL_RFSHSET1TMG0_FREQ0.t_refi_x1_x32 must be greater than 0x1. If DDRCTL_RFSHSET1TMG0_FREQ0.t_refi_x1_sel == 1, DDRCTL_RFSHSET1TMG0_FREQ0.t_refi_x1_x32 must be greater than DDRCTL_RFSHSET1TMG1_FREQ0.t_rfc_min If DDRCTL_RFSHSET1TMG0_FREQ0.t_refi_x1_sel == 0, DDRCTL_RFSHSET1TMG0_FREQ0.t_refi_x1_x32 * 32 must be greater than DDRCTL_RFSHSET1TMG1_FREQ0.t_rfc_min DDRCTL_RFSHSET1TMG0_FREQ0.t_refi_x1_x32 must be less than or equal to 0xFFE. Unit: DRAM clock cycles or multiples of 32 DRAM clock cycles, depending on DDRCTL_RFSHSET1TMG0_FREQ0.t_refi_x1_sel. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to

Bit	Attr	Reset Value	Description
7:0	RW	0x00	pageclose_timer This field works in conjunction with DDRCTL_SCHED0.pageclose. It only has meaning if DDRCTL_SCHED0.pageclose==1. If DDRCTL_SCHED0.pageclose==1 and pageclose_timer==0, then an auto-precharge may be scheduled for last read or write command in the CAM with a bank and page hit. Note, sometimes an explicit precharge is scheduled instead of the auto-precharge. See DDRCTL_SCHED0.pageclose for details of when this may happen. If DDRCTL_SCHED0.pageclose==1 and pageclose_timer>0, then an auto-precharge is not scheduled for last read or write command in the CAM with a bank and page hit. Instead, a timer is started, with pageclose_timer as the initial value. There is a timer on a per bank basis. The timer decrements unless the next read or write in the CAM to a bank is a page hit. It gets reset to pageclose_timer value if the next read or write in the CAM to a bank is a page hit. Once the timer has reached zero, an explcit precharge will be attempted to be scheduled. Unit: DRAM clock cycles. Value After Reset: 0x0 Programming Mode: Static

DDRCTL_RANKTMG0_FREQ0

Address: **Operational Base** + offset (0x0D04)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:8	RW	0x06	diff_rank_wr_gap Only present for multi-rank configurations. Indicates the number of clocks of gap in data responses when performing consecutive writes to different ranks. This is used to switch the delays in the PHY to match the rank requirements. This value must consider both PHY requirement and ODT requirement. PHY requirement: tphy_wrcsgap (see PHY databook for value of tphy_wrcsgap) If CRC feature is enabled, must be increased by 1. Write preamble is always set to 2tCK for LPDDR4, refer to PHY databook to see if this is already factored into tphy_wrcsgap value or if it needs to be increased by 1. If write postamble is set to 1.5tCK(LPDDR4 only), must be increased by 1. ODT requirement: The value programmed in this register takes care of the ODT switch off timing requirement when switching ranks during writes. For LPDDR4, with DQ ODT enabled, diff_rank_wr_gap must be a minimum of ODTLoff - ODTLon - BL/2 + 1 For other cases, diff_rank_wr_gap must be a minimum of ODTCFG.wr_odt_hold - BL/2. Program this to the larger of PHY requirement or ODT requirement. After PHY has completed training the value programmed may need to be increased. Refer to relevant PHY documentation. For LPDDR5, Please set to "JEDEC formula + tphy_wckcsgap + board delay". Please see PHY databook for the value of tphy_wckcsgap. Unit: DRAM clock cycles. Value After Reset: 0x6 Volatile: True Programming Mode: Quasi-dynamic Group 2

DDRCTL_CLKGATECTL

Address: **Operational Base** + offset (0x1018C)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x3f	bsm_clk_on Indicates whether the output signal bsm_clk_en [MEMC_NUM_RANKS-1:0] become 0 for each corresponding DDRCTL internal state: 1'b0: bsm_clk_en become 0 in case where DDRCTL is in corresponding state described below. 1'b1: bsm_clk_en remain 1 in case where DDRCTL is in corresponding state. The bsm_clk_en [MEMC_NUM_RANKS-1:0] indicates that clock can be removed when corresponding rank of this signal is 0. Each corresponding DDRCTL internal state is as follows: [0] Unpopulated rank control [1] Controller initialization state (until dfi0_init_start/dfi0_init_complete handshake is done) [2] Self Refresh mode [3] Self Refresh Powerdown mode [4] Powerdown mode [5] Deep Sleep Mode (LPDDR5 Only) Bit[5:1] indicates behavior of the bsm_clk_en for each corresponding DDRCTL internal state. For example, if this field is set to 6'b00_0100, bsm_clk_en becomes 1 when it is in self refresh mode. This implies that bsm_clk is not removed while it is in self refresh mode, but the bsm_clk is removed by external clock gating logic in other modes above. If bit 0 (Unpopulated rank control) is set to 1, behavior of the bsm_clk_en is determined by other fields in this register irrespective of MSTR.active_ranks. If the bsm_clk_en[1]=0 is needed in case of single rank (MSTR.active_ranks=1), bit 0 has to be set to 0. To maximize power-saving, this field needs to be set to 6'b00_0000. Value After Reset: 0x3f Programming Mode: Static

DDRCTL_RFSHMOD0

Address: **Operational Base** + offset (0x10200)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	RW	0x0	per_bank_refresh 1'b1: Per bank refresh 1'b0: All bank refresh Per bank refresh allows traffic to flow to other banks. Value After Reset: 0x0 Programming Mode: Static
7:6	RO	0x0	reserved

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
5:0	RW	0x00	refresh_burst The programmed value + 1 is the number of refresh timeouts that is allowed to accumulate before traffic is blocked and the refreshes are forced to execute. Closing pages to perform a refresh is a one-time penalty that must be paid for each group of refreshes. Therefore, performing refreshes in a burst reduces the per-refresh penalty of these page closings. Higher numbers for RFSHCTL.refresh_burst slightly increases utilization; lower numbers decreases the worst-case latency associated with refreshes. 6'h0: Single refresh 6'h1: Burst-of-2 refresh 6'h7: Burst-of-8 refresh In per-bank refresh mode of LPDDR4/5 (DDRCTL_RFSHMOD0.per_bank_refresh = 1), 64 refreshes can be postponed. If using PHY-initiated updates, care must be taken in the setting of DDRCTL_RFSHMOD0.refresh_burst, to ensure that tRFCmax is not violated due to a PHY-initiated update occurring shortly before a refresh burst was due. In this situation, the refresh burst will be delayed until the PHY-initiated update is complete. Value After Reset: 0x0 Programming Mode: Dynamic - Refresh Related

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
1	RW	0x0	dis_hif When 1, DDRCTL asserts the HIF command signal hif_cmd_stall. DDRCTL will ignore the hif_cmd_valid and all other associated request signals. This bit is intended to be switched on-the-fly. Value After Reset: 0x0 Programming Mode: Dynamic
0	RW	0x0	dis_dq When 1, DDRCTL will not de-queue any transactions from the CAM. Bypass is also disabled. All transactions are queued in the CAM. No reads or writes are issued to SDRAM as long as this is asserted. This bit may be used to prevent reads or writes being issued by the DDRCTL, which makes it safe to modify certain register fields associated with reads and writes (see Programming Chapter for details). After setting this bit, it is strongly recommended to poll DDRCTL_OPCTRLCAM.wr_data_pipeline_empty and DDRCTL_OPCTRLCAM.rd_data_pipeline_empty, before making changes to any registers which affect reads and writes. This will ensure that the relevant logic in the DDRC is idle. This bit is intended to be switched on-the-fly. Value After Reset: 0x0 Programming Mode: Dynamic

DDRCTL_OPREFCTRL0

Address: **Operational Base** + offset (0x10B98)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	rank1_refresh Setting this register bit to 1 indicates to the DDRCTL to issue a refresh to rank 1. Writing to this bit causes DDRCTL_OPREFSTAT0.rank1_refresh_busy to be set. When DDRCTL_OPREFSTAT0.rank1_refresh_busy is cleared, the command has been stored in the DDRCTL. For 3DS configuration, refresh is sent to logical rank index 1. This operation can be performed only when DDRCTL_RFSHCTL0.dis_auto_refresh=1. It is recommended NOT to set this register bit if in Init or Maximum Power Saving Mode. Value After Reset: 0x0 Testable: Read only Programming Mode: Dynamic
0	RW	0x0	rank0_refresh Setting this register bit to 1 indicates to the DDRCTL to issue a refresh to rank 0. Writing to this bit causes DDRCTL_OPREFSTAT0.rank0_refresh_busy to be set. When DDRCTL_OPREFSTAT0.rank0_refresh_busy is cleared, the command has been stored in the DDRCTL. For 3DS configuration, refresh is sent to logical rank index 0. This operation can be performed only when DDRCTL_RFSHCTL0.dis_auto_refresh=1. It is recommended NOT to set this register bit if in Init or Maximum Power Saving Mode. Value After Reset: 0x0 Testable: Read only Programming Mode: Dynamic

0	RO	0x1	sw_done_ack Register programming done. This register is the echo of DDRCTL_SWCTL.sw_done. Wait for sw_done value 1 to propagate to sw_done_ack at the end of the programming sequence to ensure that the correct registers values are propagated to the destination clock domains. Value After Reset: 0x1 Programming Mode: Static

DDRCTL_RANKCTL

Address: **Operational Base** + offset (0x10C90)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:12	RW	0x0	max_rank_wr Only present for multi-rank configurations. Background: Writes to the same rank can be performed back-to-back. Writes to different ranks require additional gap dictated by the register DDRCTL_RANKCTL.diff_rank_wr_gap. This is to avoid possible data bus contention as well as to give PHY enough time to switch the delay when changing ranks. The DDRCTL arbitrates for bus access on a cycle-by-cycle basis; therefore after a write is scheduled, there are few clock cycles (determined by the value on DDRCTL_RANKCTL.diff_rank_wr_gap register) in which only writes from the same rank are eligible to be scheduled. This prevents writes from other ranks from having fair access to the data bus. This parameter represents the maximum number of writes that can be scheduled consecutively to the same rank. After this number is reached, a delay equal to DDRCTL_RANKCTL.diff_rank_wr_gap is inserted by the scheduler to allow all ranks a fair opportunity to be scheduled. Higher numbers increase bandwidth utilization, lower numbers increase fairness. Minimum programmable value is 0 (feature disabled) and maximum programmable value is 0xF. FOR PERFORMANCE ONLY. Value After Reset: 0x0 Programming Mode: Static
11:4	RO	0x00	reserved
3:0	RW	0xf	max_rank_rd Only present for multi-rank configurations. Background: Reads to the same rank can be performed back-to-back. 4	RW	0x0	pagematch_limit Page match four limit. If set to 1, limits the number of consecutive same page DDRC transactions that can be granted by the Port Arbiter to four when Page Match feature is enabled. If set to 0, there is no limit imposed on number of consecutive same page DDRC transactions. Value After Reset: 0x0 Programming Mode: Static
3:1	RO	0x0	reserved
0	RW	0x0	go2critical_en If set to 1 (enabled), sets co_gs_go2critical_wr and co_gs_go2critical_lpr/co_gs_go2critical_hpr signals going to DDRC based on urgent input (awurgent, arurgent) coming from AXI master. If set to 0 (disabled), co_gs_go2critical_wr and co_gs_go2critical_lpr/co_gs_go2critical_hpr signals at DDRC are driven to 1b'0. Value After Reset: 0x0 Programming Mode: Static

DDRCTL_PCFGR_PORT0

Address: **Operational Base** + offset (0x20004)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RW	0x0	rdwr_ordered_en Enable ordered read/writes. If set to 1, preserves the ordering between read transaction and write transaction issued to the same address, on a given port. In other words, the controller ensures that all same address read and write commands from the application port interface are transported to the DFI interface in the order of acceptance. This feature is useful in cases where software coherency is desired for masters issuing back-to-back read/write transactions without waiting for write/read responses. Note that this register has an effect only if necessary logic is instantiated via the UMCTL2_RDWR_ORDERED_n parameter. Value After Reset: 0x0 Volatile: True Programming Mode: Static
15	RO	0x0	reserved
14	RW	0x1	rd_port_pagematch_en If set to 1, enables the Page Match feature. If enabled, once a requesting port is granted, the port is continued to be granted if the following immediate commands are to the same memory page (same bank and same row). See also related DDRCTL_PCCFG_PORT0.pagematch_limit register. Value After Reset: 0x1 Programming Mode: Static

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
13	RW	0x0	rd_port_urgent_en If set to 1, enables the AXI urgent sideband signal (arurgent). When enabled and arurgent is asserted by the master, that port becomes the highest priority and co_gs_go2critical_lpr/co_gs_go2critical_hpr signal to DDRC is asserted if enabled in DDRCTL_PCCFG_PORT0.go2critical_en register. Note that arurgent signal can be asserted anytime and as long as required which is independent of address handshaking (it is not associated with any particular command). Value After Reset: 0x0 Programming Mode: Static
12	RW	0x1	rd_port_aging_en If set to 1, enables aging function for the read channel of the port. Value After Reset: 0x1 Programming Mode: Static
11:10	RO	0x0	reserved
9:0	RW	0x01f	rd_port_priority Determines the initial load value of read aging counters. These counters will be parallel loaded after reset, or after each grant to the corresponding port. The aging counters down-count every clock cycle where the port is requesting but not granted. The higher significant 5-bits of the read aging counter sets the priority of the read channel of a given port. Port's priority will increase as the higher significant 5-bits of the counter starts to decrease. When the aging counter becomes 0, the corresponding port channel will have the highest priority level (timeout condition - Priority0). For multi-port configurations, the aging counters cannot be used to set port priorities when external dynamic priority inputs (arqos) are enabled (timeout is still applicable). For single port configurations, the aging counters are only used when they timeout (become 0) to force read-write direction switching. In this case, external dynamic priority input, arqos (for reads only) can still be used to set the DDRC read priority(2 priority levels: low priority read - LPR, high priority read - HPR) on a command by command basis. Note: The two LSBs of this register field are tied internally to 2'b00. Value After Reset: 0x1f Programming Mode: Static

Bit	Attr	Reset Value	Description
14	RW	0x1	rd_port_pagematch_en If set to 1, enables the Page Match feature. If enabled, once a requesting port is granted, the port is continued to be granted if the following immediate commands are to the same memory page (same bank and same row). See also related DDRCTL_PCCFG_PORT0.pagematch_limit register. Value After Reset: 0x1 Programming Mode: Static
13	RW	0x0	rd_port_urgent_en If set to 1, enables the AXI urgent sideband signal (arurgent). When enabled and arurgent is asserted by the master, that port becomes the highest priority and co_gs_go2critical_lpr/co_gs_go2critical_hpr signal to DDRC is asserted if enabled in DDRCTL_PCCFG_PORT0.go2critical_en register. Note that arurgent signal can be asserted anytime and as long as required which is independent of address handshaking (it is not associated with any particular command). Value After Reset: 0x0 Programming Mode: Static
12	RW	0x1	rd_port_aging_en If set to 1, enables aging function for the read channel of the port. Value After Reset: 0x1 Programming Mode: Static
11:10	RO	0x0	reserved
9:0	RW	0x01f	rd_port_priority Determines the initial load value of read aging counters. These counters will be parallel loaded after reset, or after each grant to the corresponding port. The aging counters down-count every clock cycle where the port is requesting but not granted. The higher significant 5-bits of the read aging counter sets the priority of the read channel of a given port. Port's priority will increase as the higher significant 5-bits of the counter starts to decrease. When the aging counter becomes 0, the corresponding port channel will have the highest priority level (timeout condition - Priority0). For multi-port configurations, the aging counters cannot be used to set port priorities when external dynamic priority inputs (arqos) are enabled (timeout is still applicable). For single port configurations, the aging counters are only used when they timeout (become 0) to force read-write direction switching. In this case, external dynamic priority input, arqos (for reads only) can still be used to set the DDRC read priority(2 priority levels: low priority read - LPR, high priority read - HPR) on a command by command basis. Note: The two LSBs of this register field are tied internally to 2'b00. Value After Reset: 0x1f Programming Mode: Static

Bit	Attr	Reset Value	Description
31:15	RO	0x00000	reserved
14	RW	0x1	wr_port_pagematch_en If set to 1, enables the Page Match feature. If enabled, once a requesting port is granted, the port is continued to be granted if the following immediate commands are to the same memory page (same bank and same row). See also related DDRCTL_PCCFG_PORT0.pagematch_limit register. Value After Reset: 0x1 Programming Mode: Static
13	RW	0x0	wr_port_urgent_en If set to 1, enables the AXI urgent sideband signal (awurgent). When enabled and awurgent is asserted by the master, that port becomes the highest priority and co_gs_go2critical_wr signal to DDRC is asserted if enabled in DDRCTL_PCCFG_PORT0.go2critical_en register. Note that awurgent signal can be asserted anytime and as long as required which is independent of address handshaking (it is not associated with any particular command). Value After Reset: 0x0 Programming Mode: Static
12	RW	0x1	wr_port_aging_en If set to 1, enables aging function for the write channel of the port. Value After Reset: 0x1 Programming Mode: Static
11:10	RO	0x0	reserved
9:0	RW	0x01f	wr_port_priority Determines the initial load value of write aging counters. These counters will be parallel loaded after reset, or after each grant to the corresponding port. The aging counters down-count every clock cycle where the port is requesting but not granted. The higher significant 5-bits of the write aging counter sets the initial priority of the write channel of a given port. Port's priority will increase as the higher significant 5-bits of the counter starts to decrease. When the aging counter becomes 0, the corresponding port channel will have the highest priority level. For multi-port configurations, the aging counters cannot be used to set port priorities when external dynamic priority inputs (awqos) are enabled (timeout is still applicable). For single port configurations, the aging counters are only used when they timeout (become 0) to force read-write direction switching. Note: The two LSBs of this register field are tied internally to 2'b00.

DDRCTL_DFIUPDTMG1_FREQ1

Address: **Operational Base** + offset (0x1005AC)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RW	0x01	dfi_t_ctrlupd_interval_min_x1024 This is the minimum amount of time between DDRCTL initiated DFI update requests (which is executed whenever the DDRCTL is idle). Set this number higher to reduce the frequency of update requests, which can have a small impact on the latency of the first read request when the DDRCTL is idle. Minimum allowed value for this field is 1. Unit: Multiples of 1024 DFI clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset: 0x01 Programming Mode: Static
15:8	RO	0x00	reserved
7:0	RW	0x01	dfi_t_ctrlupd_interval_max_x1024 This is the maximum amount of time between DDRCTL initiated DFI update requests. This timer resets with each update request; when the timer expires dfi_ctrlupd_req is sent and traffic is blocked until the dfi_ctrlupd_ackx is received. PHY can use this idle time to recalibrate the delay lines to the DLLs. The DFI controller update is also used to reset PHY FIFO pointers in case of data capture errors. Updates are required to maintain calibration over PVT, but frequent updates may impact performance. Minimum allowed value for this field is 1. Note: Value programmed for dfi_t_ctrlupd_interval_max_x1024 must be greater than dfi_t_ctrlupd_interval_min_x1024. Unit: Multiples of 1024 DFI clock cycles.

DDRCTL_RFSHSET1TMG0_FREQ1

Address: **Operational Base** + offset (0x100600)

Bit	Attr	Reset Value	Description
31	RW	0x0	t_refi_x1_sel Specifies whether DDRCTL_RFSHSET1TMG0_FREQ1.t_refi_x1_x32 and DDRCTL_RFSHSET1TMG0_FREQ1.refresh_to_x1_x32 register values are x1 or x32. 1'b0: x32 register values are used. 1'b1: Register values are used. This applies only when per-bank refresh is enabled (DDRCTL_RFSHMOD0.per_bank_refresh=1). If per-bank refresh is not enabled, the x32 register values are used and this register field is ignored. This register field does not exist for configurations which do not support LPDDR4/5. For such configurations, the value of this register field can be assumed to be 0, so that DDRCTL_RFSHSET1TMG0_FREQ1.t_refi_x1_x32 and DDRCTL_RFSHSET1TMG0_FREQ1.refresh_to_x1_x32 are interpreted as x32 register fields Value After Reset: 0x0 Programming Mode: Dynamic - Refresh Related
30:28	RO	0x0	reserved
27:24	RW	0x2	refresh_margin Threshold value in number of DRAM clock cycles before the critical refresh or page timer expires. A critical refresh is to be issued before this threshold is reached. It is recommended that this not be changed from the default value, currently shown as 0x2. It must always be less than internally used t_refi/32. Note that internally used t_refi is equal to DDRCTL_RFSHSET1TMG0_FREQ1.t_refi_x1_x32 * 32 if DDRCTL_RFSHSET1TMG0_FREQ1.t_refi_x1_sel = 0. If DDRCTL_RFSHSET1TMG0_FREQ1.t_refi_x1_sel = 1, internally used t_refi is equal to DDRCTL_RFSHSET1TMG0_FREQ1.t_refi_x1_x32. Note that, internally used t_refi may be divided by four if derating or TCR is enabled. Unit: Multiples of 32 DRAM clock cycles. Value After Reset: 0x2 Programming Mode: Dynamic - Refresh Related
23:22	RO	0x0	reserved
21:16	RW	0x10	refresh_to_x1_x32 If the refresh timer has expired at least once (i.e. >tREFI period elapses, and there are postponed refreshes), then a speculative refresh may be performed. A speculative refresh is a refresh performed at a time when refresh would be useful. When there are no transactions pending in the CAM for a period of time determined by this DDRCTL_RFSHSET1TMG0_FREQ1.refresh_to_x1_x32 and the refresh timer has expired at least once since the last refresh,

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
			then a speculative refresh is performed. Speculative refreshes continues successively until there are no refreshes pending or until new reads or writes are issued to the DDRCTL. This is also used for non speculative refresh when LPDDR per-bank refresh (REFpb) is enabled. The controller observes the period of time determined by this for each bank, and a priority of bank address is determined. This should be programmed to tREFI based value in controller's current refresh mode. The controller calculates this according to current refresh mode. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. FOR PERFORMANCE ONLY. Unit: DRAM clock cycles or multiples of 32 DRAM clock cycles, depending on DDRCTL_RFSHSET1TMG0_FREQ1.t_refi_x1_sel. Value After Reset: 0x10 Programming Mode: Dynamic - Refresh Related
15:12	RO	0x0	reserved
11:0	RW	0x062	t_refi_x1_x32 Average time interval between refreshes per rank (See JEDEC specification for LPDDR4). Set this register to RoundDown(tREFI/tCK). If DDRCTL_RFSHSET1TMG0_FREQ1.t_refi_x1_sel = 0, divide the above result by 32 and round down. For LPDDR controller: If using all-bank refreshes (DDRCTL_RFSHMOD0.per_bank_refresh = 0), use tREFIab in the above calculations. If using per-bank refreshes (DDRCTL_RFSHMOD0.per_bank_refresh = 1), use tREFIpb in the above calculations. Note that: DDRCTL_RFSHSET1TMG0_FREQ1.t_refi_x1_x32 must be greater than 0x1. If DDRCTL_RFSHSET1TMG0_FREQ1.t_refi_x1_sel == 1, DDRCTL_RFSHSET1TMG0_FREQ1.t_refi_x1_x32 must be greater than DDRCTL_RFSHSET1TMG1_FREQ1.t_rfc_min If DDRCTL_RFSHSET1TMG0_FREQ1.t_refi_x1_sel == 0, DDRCTL_RFSHSET1TMG0_FREQ1.t_refi_x1_x32 * 32 must be greater than DDRCTL_RFSHSET1TMG1_FREQ1.t_rfc_min DDRCTL_RFSHSET1TMG0_FREQ1.t_refi_x1_x32 must be less than or equal to 0xFFE. Unit: DRAM clock cycles or multiples of 32 DRAM clock cycles, depending on DDRCTL_RFSHSET1TMG0_FREQ1.t_refi_x1_sel. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Address: **Operational Base** + offset (0x100C00)

Bit	Attr	Reset Value	Description
31:15	RO	0x00000	reserved
14:8	RW	0x00	rdwr_idle_gap When the preferred transaction store is empty for these many clock cycles, switch to the alternate transaction store if it is non-empty. The read transaction store (both high and low priority) is the default preferred transaction store and the write transaction store is the alternative store. When prefer write over read is set this is reversed. 0x0 is a legal value for this register. When set to 0x0, the transaction store switching will happen immediately when the switching conditions become true. FOR PERFORMANCE ONLY. Unit: DRAM clock cycles. Value After Reset: 0x0 Programming Mode: Static
7:0	RW	0x00	pageclose_timer This field works in conjunction with DDRCTL_SCHED0.pageclose. It only has meaning if DDRCTL_SCHED0.pageclose==1. If DDRCTL_SCHED0.pageclose==1 and pageclose_timer==0, then an auto-precharge may be scheduled for last read or write command in the CAM with a bank and page hit. Note, sometimes an explicit precharge is scheduled instead of the auto-precharge. See DDRCTL_SCHED0.pageclose for details of when this may happen. If DDRCTL_SCHED0.pageclose==1 and pageclose_timer>0, then an auto-precharge is not scheduled for last read or write command in the CAM with a bank and page hit. Instead, a timer is started, with pageclose_timer as the initial value. There is a timer on a per bank basis. The timer decrements unless the next read or write in the CAM to a bank is a page hit. It gets reset to pageclose_timer value if the next read or write in the CAM to a bank is a page hit. Once the timer has reached

Bit	Attr	Reset Value	Description
15:8	RW	0x06	diff_rank_wr_gap Only present for multi-rank configurations. Indicates the number of clocks of gap in data responses when performing consecutive writes to different ranks. This is used to switch the delays in the PHY to match the rank requirements. This value must consider both PHY requirement and ODT requirement. PHY requirement: tphy_wrcsgap (see PHY databook for value of tphy_wrcsgap) If CRC feature is enabled, must be increased by 1. Write preamble is always set to 2tCK for LPDDR4, refer to PHY databook to see if this is already factored into tphy_wrcsgap value or if it needs to be increased by 1. If write postamble is set to 1.5tCK(LPDDR4 only), must be increased by 1. ODT requirement: The value programmed in this register takes care of the ODT switch off timing requirement when switching ranks during writes. For LPDDR4, with DQ ODT enabled, diff_rank_wr_gap must be a minimum of ODTLoff - ODTLon - BL/2 + 1 For other cases, diff_rank_wr_gap must be a minimum of ODTCFG.wr_odt_hold - BL/2. Program this to the larger of PHY requirement or ODT requirement. After PHY has completed training the value programmed may need to be increased. Refer to relevant PHY documentation. For LPDDR5, Please set to "JEDEC formula + tphy_wckcsgap + board delay". Please see PHY databook for the value of tphy_wckcsgap. Unit: DRAM clock cycles. Value After Reset: 0x6 Volatile: True Programming Mode: Quasi-dynamic Group 2
7:0	RW	0x06	diff_rank_rd_gap Only present for multi-rank configurations. Indicates the number of clocks of gap in data responses when performing consecutive reads to different ranks. This is used to switch the delays in the PHY to match the rank requirements. This value must consider both PHY requirement and ODT requirement. PHY requirement: tphy_rdcsgap (see PHY databook for value of tphy_rdcsgap) ODT requirement: The value programmed in this register takes care of the ODT switch off timing requirement when switching ranks during reads: Program this to the larger of PHY requirement or ODT requirement. After PHY has completed training the value programmed may need to be increased. Refer to relevant PHY documentation. For LPDDR5, Please set to "JEDEC formula + tphy_wckcsgap + board delay". 7:0	RW	0x00	dfi_twck_toggle_post Defines the number of clock cycles after a read or write command data burst completion during which the WCK must remain in the current toggle state. Unit: WCK cycles Value After Reset: 0x0 Volatile: True Programming Mode: Quasi-dynamic Group 1, Group 4

DDRCTL_DFIUPDTMG1_FREQ2

Address: **Operational Base** + offset (0x2005AC)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved

Bit	Attr	Reset Value	Description
23:16	RW	0x01	dfi_t_ctrlupd_interval_min_x1024 This is the minimum amount of time between DDRCTL initiated DFI update requests (which is executed whenever the DDRCTL is idle). Set this number higher to reduce the frequency of update requests, which can have a small impact on the latency of the first read request when the DDRCTL is idle. Minimum allowed value for this field is 1. Unit: Multiples of 1024 DFI clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset: 0x01 Programming Mode: Static
15:8	RO	0x00	reserved
7:0	RW	0x01	dfi_t_ctrlupd_interval_max_x1024 This is the maximum amount of time between DDRCTL initiated DFI update requests. This timer resets with each update request; when the timer expires dfi_ctrlupd_req is sent and traffic is blocked until the dfi_ctrlupd_ackx is received. PHY can use this idle time to recalibrate the delay lines to the DLLs. The DFI controller update is also used to reset PHY FIFO pointers in case of data capture errors. Updates are required to maintain calibration over PVT, but frequent updates may impact performance. Minimum allowed value for this field is 1. Note: Value programmed for dfi_t_ctrlupd_interval_max_x1024 must be greater than dfi_t_ctrlupd_interval_min_x1024. Unit: Multiples of 1024 DFI clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset: 0x01 Programming Mode: Static

DDRCTL_RFSHSET1TMG0_FREQ2

Address: **Operational Base** + offset (0x200600)

Bit	Attr	Reset Value	Description
31	RW	0x0	t_refi_x1_sel Specifies whether DDRCTL_RFSHSET1TMG0_FREQ2.t_refi_x1_x32 and DDRCTL_RFSHSET1TMG0_FREQ2.refresh_to_x1_x32 register values are x1 or x32. 1'b0: x32 register values are used. 1'b1: Register values are used. This applies only when per-bank refresh is enabled (DDRCTL_RFSHMOD0.per_bank_refresh=1). If per-bank refresh is not enabled, the x32 register values are used and this register field is ignored. This register field does not exist for configurations which do not support LPDDR4/5. For such configurations, the value of this register field can be assumed to be 0, so that DDRCTL_RFSHSET1TMG0_FREQ2.t_refi_x1_x32 and DDRCTL_RFSHSET1TMG0_FREQ2.refresh_to_x1_x32 are interpreted as x32 register fields Value After Reset: 0x0 Programming Mode: Dynamic - Refresh Related
30:28	RO	0x0	reserved

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
27:24	RW	0x2	refresh_margin Threshold value in number of DRAM clock cycles before the critical refresh or page timer expires. A critical refresh is to be issued before this threshold is reached. It is recommended that this not be changed from the default value, currently shown as 0x2. It must always be less than internally used t_refi/32. Note that internally used t_refi is equal to DDRCTL_RFSHSET1TMG0_FREQ2.t_refi_x1_x32 * 32 if DDRCTL_RFSHSET1TMG0_FREQ2.t_refi_x1_sel = 0. If DDRCTL_RFSHSET1TMG0_FREQ2.t_refi_x1_sel = 1, internally used t_refi is equal to DDRCTL_RFSHSET1TMG0_FREQ2.t_refi_x1_x32. Note that, internally used t_refi may be divided by four if derating or TCR is enabled. Unit: Multiples of 32 DRAM clock cycles. Value After Reset: 0x2 Programming Mode: Dynamic - Refresh Related
23:22	RO	0x0	reserved
21:16	RW	0x10	refresh_to_x1_x32 If the refresh timer has expired at least once (i.e. >tREFI period elapses, and there are postponed refreshes), then a speculative refresh may be performed. A speculative refresh is a refresh performed at a time when refresh would be useful. When there are no transactions pending in the CAM for a period of time determined by this DDRCTL_RFSHSET1TMG0_FREQ2.refresh_to_x1_x32 and the refresh timer has expired at least once since the last refresh, then a speculative refresh is performed. Speculative refreshes continues successively until there are no refreshes pending or until new reads or writes are issued to the DDRCTL. This is also used for non speculative refresh when LPDDR per-bank refresh (REFpb) is enabled. The controller observes the period of time determined by this for each bank, and a priority of bank address is determined. This should be programmed to tREFI based value in controller's current refresh mode. The controller calculates this according to current refresh mode. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. FOR PERFORMANCE ONLY. Unit: DRAM clock cycles or multiples of 32 DRAM clock cycles, depending on DDRCTL_RFSHSET1TMG0_FREQ2.t_refi_x1_sel. Value After Reset: 0x10 Programming Mode: Dynamic - Refresh Related

Bit	Attr	Reset Value	Description
14:8	RW	0x00	rdwr_idle_gap When the preferred transaction store is empty for these many clock cycles, switch to the alternate transaction store if it is non-empty. The read transaction store (both high and low priority) is the default preferred transaction store and the write transaction store is the alternative store. When prefer write over read is set this is reversed. 0x0 is a legal value for this register. When set to 0x0, the transaction store switching will happen immediately when the switching conditions become true. FOR PERFORMANCE ONLY. Unit: DRAM clock cycles. Value After Reset: 0x0 Programming Mode: Static
7:0	RW	0x00	pageclose_timer This field works in conjunction with DDRCTL_SCHED0.pageclose. It only has meaning if DDRCTL_SCHED0.pageclose==1. If DDRCTL_SCHED0.pageclose==1 and pageclose_timer==0, then an auto-precharge may be scheduled for last read or write command in the CAM with a bank and page hit. Note, sometimes an explicit precharge is scheduled instead of the auto-precharge. See DDRCTL_SCHED0.pageclose for details of when this may happen. If DDRCTL_SCHED0.pageclose==1 and pageclose_timer>0, then an auto-precharge is not scheduled for last read or write command in the CAM with a bank and page hit. Instead, a timer is started, with pageclose_timer as the initial value. There is a timer on a per bank basis. The timer decrements unless the next read or write in the CAM to a bank is a page hit. It gets reset to pageclose_timer value if the next read or write in the CAM to a bank is a page hit. Once the timer has reached zero, an explcit precharge will be attempted to be scheduled. Unit: DRAM clock cycles. Value After Reset: 0x0 Programming Mode: Static

DDRCTL_DFIUPDTMG1_FREQ3

Address: **Operational Base** + offset (0x3005AC)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved

Bit	Attr	Reset Value	Description
23:16	RW	0x01	dfi_t_ctrlupd_interval_min_x1024 This is the minimum amount of time between DDRCTL initiated DFI update requests (which is executed whenever the DDRCTL is idle). Set this number higher to reduce the frequency of update requests, which can have a small impact on the latency of the first read request when the DDRCTL is idle. Minimum allowed value for this field is 1. Unit: Multiples of 1024 DFI clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset: 0x01 Programming Mode: Static
15:8	RO	0x00	reserved
7:0	RW	0x01	dfi_t_ctrlupd_interval_max_x1024 This is the maximum amount of time between DDRCTL initiated DFI update requests. This timer resets with each update request; when the timer expires dfi_ctrlupd_req is sent and traffic is blocked until the dfi_ctrlupd_ackx is received. PHY can use this idle time to recalibrate the delay lines to the DLLs. The DFI controller update is also used to reset PHY FIFO pointers in case of data capture errors. Updates are required to maintain calibration over PVT, but frequent updates may impact performance. Minimum allowed value for this field is 1. Note: Value programmed for dfi_t_ctrlupd_interval_max_x1024 must be greater than dfi_t_ctrlupd_interval_min_x1024. Unit: Multiples of 1024 DFI clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset: 0x01 Programming Mode: Static

DDRCTL_RFSHSET1TMG0_FREQ3

Address: **Operational Base** + offset (0x300600)

Bit	Attr	Reset Value	Description
31	RW	0x0	t_refi_x1_sel Specifies whether DDRCTL_RFSHSET1TMG0_FREQ3.t_refi_x1_x32 and DDRCTL_RFSHSET1TMG0_FREQ3.refresh_to_x1_x32 register values are x1 or x32. 1'b0: x32 register values are used. 1'b1: Register values are used. This applies only when per-bank refresh is enabled (DDRCTL_RFSHMOD0.per_bank_refresh=1). If per-bank refresh is not enabled, the x32 register values are used and this register field is ignored. This register field does not exist for configurations which do not support LPDDR4/5. For such configurations, the value of this register field can be assumed to be 0, so that DDRCTL_RFSHSET1TMG0_FREQ3.t_refi_x1_x32 and DDRCTL_RFSHSET1TMG0_FREQ3.refresh_to_x1_x32 are interpreted as x32 register fields Value After Reset: 0x0 Programming Mode: Dynamic - Refresh Related
30:28	RO	0x0	reserved

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
27:24	RW	0x2	refresh_margin Threshold value in number of DRAM clock cycles before the critical refresh or page timer expires. A critical refresh is to be issued before this threshold is reached. It is recommended that this not be changed from the default value, currently shown as 0x2. It must always be less than internally used t_refi/32. Note that internally used t_refi is equal to DDRCTL_RFSHSET1TMG0_FREQ3.t_refi_x1_x32 * 32 if DDRCTL_RFSHSET1TMG0_FREQ3.t_refi_x1_sel = 0. If DDRCTL_RFSHSET1TMG0_FREQ3.t_refi_x1_sel = 1, internally used t_refi is equal to DDRCTL_RFSHSET1TMG0_FREQ3.t_refi_x1_x32. Note that, internally used t_refi may be divided by four if derating or TCR is enabled. Unit: Multiples of 32 DRAM clock cycles. Value After Reset: 0x2 Programming Mode: Dynamic - Refresh Related
23:22	RO	0x0	reserved
21:16	RW	0x10	refresh_to_x1_x32 If the refresh timer has expired at least once (i.e. >tREFI period elapses, and there are postponed refreshes), then a speculative refresh may be performed. A speculative refresh is a refresh performed at a time when refresh would be useful. When there are no transactions pending in the CAM for a period of time determined by this DDRCTL_RFSHSET1TMG0_FREQ3.refresh_to_x1_x32 and the refresh timer has expired at least once since the last refresh, then a speculative refresh is performed. Speculative refreshes continues successively until there are no refreshes pending or until new reads or writes are issued to the DDRCTL. This is also used for non speculative refresh when LPDDR per-bank refresh (REFpb) is enabled. The controller observes the period of time determined by this for each bank, and a priority of bank address is determined. This should be programmed to tREFI based value in controller's current refresh mode. The controller calculates this according to current refresh mode. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. FOR PERFORMANCE ONLY. Unit: DRAM clock cycles or multiples of 32 DRAM clock cycles, depending on DDRCTL_RFSHSET1TMG0_FREQ3.t_refi_x1_sel. Value After Reset: 0x10 Programming Mode: Dynamic - Refresh Related
15:12	RO	0x0	reserved
11:0	RW	0x062	t_refi_x1_x32 Average time interval between refreshes per rank (See JEDEC specification for LPDDR4). Set this register to RoundDown(tREFI/tCK). If DDRCTL_RFSHSET1TMG0_FREQ3.t_refi_x1_sel = 0, divide the above result by 32 and round down. For LPDDR controller: If using all-bank refreshes (DDRCTL_RFSHMOD0.per_bank_refresh = 0), use tREFIab in the above calculations.

14:8	RW	0x00	rdwr_idle_gap When the preferred transaction store is empty for these many clock cycles, switch to the alternate transaction store if it is non-empty. The read transaction store (both high and low priority) is the default preferred transaction store and the write transaction store is the alternative store. When prefer write over read is set this is reversed. 0x0 is a legal value for this register. When set to 0x0, the transaction store switching will happen immediately when the switching conditions become true. FOR PERFORMANCE ONLY. Unit: DRAM clock cycles. Value After Reset: 0x0 Programming Mode: Static
7:0	RW	0x00	pageclose_timer This field works in conjunction with DDRCTL_SCHED0.pageclose. It only has meaning if DDRCTL_SCHED0.pageclose==1. If DDRCTL_SCHED0.pageclose==1 and pageclose_timer==0, then an auto-precharge may be scheduled for last read or write command in the CAM with a bank and page hit. Note, sometimes an explicit precharge is scheduled instead of the auto-precharge. See DDRCTL_SCHED0.pageclose for details of when this may happen. If DDRCTL_SCHED0.pageclose==1 and pageclose_timer>0, then an auto-precharge is not scheduled for last read or write command in the CAM with a bank and page hit. Instead, a timer is started, with pageclose_timer as the initial value. There is a timer on a per bank basis. The timer decrements unless the next read or write in the CAM to a bank is a page hit. It gets reset to pageclose_timer value if the next read or write in the CAM to a bank is a page hit. Once the timer has reached zero, an explcit precharge will be attempted to be scheduled. Unit: DRAM clock cycles. Value After Reset: 0x0 Programming Mode: Static

DDRCTL_RANKTMG1_FREQ3

Address: **Operational Base** + offset (0x300D08)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:8	RW	0x0f	rd2wr_dr Minimum time from read command to write command for different rank. Includes time for bus turnaround, recovery times, and all per-bank, per-rank, and global constraints. The value must be larger than or equal to the value of DRAMSET1TMG2.rd2wr. For LPDDR5, Please set to "JEDEC formula + tphy_wckcsgap + board delay". Please see PHY databook for the value of tphy_wckcsgap. Unit: DRAM clock cycles Value After Reset: 0xf Volatile: True Programming Mode: Quasi-dynamic Group 1, Group 2, Group 4

Bit	Attr	Reset Value	Description
7:0	RW	0x0f	wr2rd_dr Minimum time from write command to read command for different rank. Includes time for bus turnaround, recovery times, and all per-bank, per-rank, and global constraints. For LPDDR5, Please set to "JEDEC formula + tphy_wckcsgap + board delay". Please see PHY databook for the value of tphy_wckcsgap. Unit: DRAM clock cycles Value After Reset: 0xf Volatile: True Programming Mode: Quasi-dynamic Group 1, Group 2, Group 4

DDRCTL_PWRTMG_FREQ3

Address: **Operational Base** + offset (0x300D0C)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25:16	RW	0x040	selfref_to_x32 After this many clocks of the DDRC command channel being idle the DDRCTL automatically puts the SDRAM into Self Refresh. The DDRC command channel is considered idle when there are no HIF commands outstanding. This must be enabled in the PWRCTL.selfref_en. FOR PERFORMANCE ONLY. Unit: Multiples of 32 DRAM clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset: 0x40 Volatile: True Programming Mode: Quasi-dynamic Group 4
15:7	RO	0x000	reserved
6:0	RW	0x10	powerdown_to_x32 After this many clocks of the DDRC command channel being idle the DDRCTL automatically puts the SDRAM into power-down. The DDRC command channel is considered idle when there are no HIF commands outstanding. This must be enabled in the PWRCTL.powerdown_en. FOR PERFORMANCE ONLY. Unit: Multiples of 32 DRAM clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset: 0x10 Volatile: True Programming Mode: Quasi-dynamic Group 4

7.4.4 Internal Address Mapping For DDRPHY

Slave address can be divided into different length for different usage, which is shown as follows.

Operational Base

Name	Base Address
DDRPHY0	0x2A020000
DDRPHY1	0x2A030000

7.4.5 Registers Summary For DDRPHY

Copyright © 2024 Rockchip Electronics Co., Ltd.

Name	Offset	Size	Reset Value	Description
DDRPHY_GNR_CON0	0x0000	W	0x44005011	General Control Register 0
DDRPHY_CAL_CON0	0x0004	W	0x789606C0	Calibration Control Register 0
DDRPHY_CAL_CON1	0x0008	W	0x20142001	Calibration Control Register 1
DDRPHY_CAL_CON2	0x000C	W	0x42001300	Calibration Control Register 2
DDRPHY_CAL_CON3	0x0010	W	0xFC7F9000	Calibration Control Register 3
DDRPHY_CAL_CON4	0x0014	W	0x0083806F	Calibration Control Register 4
DDRPHY_LP_CON0	0x0018	W	0x000C4403	Low Power Control Register 0
DDRPHY_GATE_CON0	0x001C	W	0x03003003	Gate Control Register 0
DDRPHY_OFFSETR_CON0	0x0020	W	0x00000000	Read DQS Code Offset Control Register 0
DDRPHY_OFFSETW_CON0	0x0030	W	0x00000000	Write DQ Code Offset Control Register 0

7.4.6 Detail Registers Description For DDRPHY

DDRPHY_GNR_CON0

Address: **Operational Base** + offset (0x0000)

Bit	Attr	Reset Value	Description
31:30	RW	0x1	ctrl_upd_time It controls when DLL is updated. Clock period information from master DLL will be updated to slave DLLs by DLL update. 2'b00: Update always 2'b01: To update depending on "ctrl_flock" 2'b10: To update periodically with interval defined by ctrl_upd_interval 2'b11: Don't update DLL
29:28	RW	0x0	ctrl_upd_range It decides how many differences between the new lock value and the current lock value which is used in slave DLL is needed for updating lock value. upd_range_ext = 2'b00 (default) 2'b00: Update when difference is greater than 0 tFS. 2'b01: Update when difference is greater than 3 tFS. 2'b10: Update when difference is greater than 7 tFS. 2'b11: Update when difference is greater than 15 tFS. upd_range_ext = 2'b01 2'b00: Update when difference is greater than 5 tFS. 2'b01: Update when difference is greater than 9 tFS. 2'b10: Update when difference is greater than 11 tFS. 2'b11: Update when difference is greater than 13 tFS. upd_range_ext = 2'b10 2'b00: Update when difference is greater than 17 tFS. 2'b01: Update when difference is greater than 19 tFS. 2'b10: Update when difference is greater than 21 tFS. 2'b11: Update when difference is greater than 23 tFS. upd_range_ext = 2'b11 2'b00: Update when difference is greater than 25 tFS. 2'b01: Update when difference is greater than 27 tFS.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
			2'b10: Update when difference is greater than 29 tFS. 2'b11: Update when difference is greater than 31 tFS.
27	RW	0x0	ctrl_twpst Write postamble length control. Vendor specific option 1'b0: 0.5tCK 1'b1: 1.5tCK
26	RW	0x1	ctrl_dfdqs DQS I/O Receiver mode setting 1'b0: Single-ended DQS (io_dqs_se = 2'b11) 1'b1: Differential DQS (io_dqs_se =2'b00)
25:24	RW	0x0	ctrl_ddr_mode 2'b00: LPDDR4 2'b10: LPDDR5 Others: Reserved
23:21	RW	0x0	ctrl_fnc_fb FNC Feedback mode setting 3'b000: FNC Feedback disable 3'b010: External FNC Feedback mode 3'b011: Internal FNC Feedback mode Others: Reserved
20	RW	0x0	dvfs_gate_upd_mode Gate information update mode for DVFS pause. 1'b0: Gate delay information will be restored to the initial training result whenever DVFS pause occurs. 1'b1: Gate delay information will not be restore to the initial training result if DVFS pause occurs without changing dvfs_mode and clock frequency in order to make DLL relock.
19	RW	0x0	wdqs_oen_mode Write DQS drive state control mode. 1'b0: DQS will be driven except for the read duration. ds_io_pd should be set to 1. 1'b1: DQS will be driven only for write duration.
18	RW	0x0	write_se_dqs Single ended mode enable for write DQS. It can be enabled to reduce power consumption. 1'b0: Single ended mode is disabled for Write DQS. 1'b1: Single ended mode is enabled for Write DQS. Caution: write_se_ck should be enabled using write_se_dqs in LPDDR4.
17	RW	0x0	write_se_ck Single ended mode enable for CK. It can be enabled to reduce power consumption. 1'b0: Single ended mode is disabled for CK. 1'b1: Single ended mode is enabled for CK. Caution: write_se_dqs should be enabled using write_se_ck in LPDDR4. Caution: write_se_wck should be enabled using write_se_ck in LPDDR5.
16	RW	0x0	ctrl_pd_width PD (io_dqs_pd, io_dq_pd, io_dm_pd) signal width control. 1'b0: Same width with READ (io_pdqs_read, io_ndqs_read, io_dq_read, io_dm_read) 1'b1: Longer than READ

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
15	RW	0x0	ctrl_twpre Write preamble length control. Refer to DRAM spec for write preamble definition. 1'b0: 2 tCK for higher speeds 1'b1: 1 tCK for lower speeds
14	RW	0x1	ctrl_otf_bl On-the-fly BL enable 1'b0: On-the-fly BL is disabled. 1'b1: On-the-fly BL is enabled.
13:8	RW	0x10	ctrl_bstlen Fixed Burst Length (BL). This field is ignored when ctrl_otf_bl is 1'b1. 6'h10: BL = 16 6'h20: BL = 32 Others: Reserved
7	RW	0x0	ctrl_ckdis Deprecated.
6	RW	0x0	ctrl_cmosrcv This field controls the input mode of I/O. 1'b0: Differential receiver mode for high speed operation (io_dqs_cmosrcv = 2'b0, io_dm_cmosrcv = 2'b0, io_dq_cmosrcv = 16'h0000) 1'b1: CMOS receiver mode for low speed operation (under 400MHz) (io_dqs_cmosrcv = 2'b11, io_dm_cmosrcv = 2'b11, io_dq_cmosrcv = 16'hffff)
5:0	RW	0x11	ctrl_rdlat_rank0 Read latency (RL) for rank0

DDRPHY_CAL_CON0

Address: **Operational Base** + offset (0x0004)

Bit	Attr	Reset Value	Description
31:30	RW	0x1	cs_default Default dfi_wrdata_cs setting. This field will set the default value for internally generated dfi_wrdata_cs, which will be used when wr_per_rank_en is disabled.
29	RW	0x1	wr_per_rank_en Per-rank write DQ/DM DLL control enable. If this field is enabled, write training should be done for both rank0 and rank1 and dfi_wrdata_cs should be properly controlled by the memory controller. If this field is disabled, dfi_wrdata_cs will be controlled internally by PHY, and it will be fixed to the default chip select, which is specified in cs_default. 1'b1: Write DQ DLL code will be controlled per rank. 1'b0: Write DQ DLL code will be fixed for rank-to-rank write.
28	RW	0x1	rd_per_rank_en Per-rank read DQS/DQ/DM DLL control enable. If this field is enabled, Read training should be done for both rank0 and rank1. 1'b1: Read DQS/DQ/DM DLL code will be controlled per rank. 1'b0: Read DQS/DQ/DM DLL code will be fixed for rank-to-rank read.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
27	RW	0x1	gate_rdchk_en Gate training read check enable control signal. If this is enabled, PHY will check if the read data from DRAM caused by MPC-RD DQ Calibration from the memory controller is correct or not while finding the read DQS location during gate training. 1'b1: Read check is enabled during gate training. 1'b0: Read check is disabled during gate training.
26	RW	0x0	dvfs_wr_train_en DVFS Write training enable. If enabled, write training initiation with dfi_lvl_periodic=0 will be interpreted as DVFS write training. During the initial training, dvfs_wr_train_en should be 0. 1'b1: DVFS write training enabled. Training logic will find tDQS2DQ variation. The start point is determined by dvfs_wr_start_adj. Training will finish when the valid data widow edge is found. 1'b0: DVFS write training disabled.
25:24	RW	0x0	avg_window_size Average window size for DLL lock value average. 2'b00: Lock value will be sampled 32 times and averaged (Default). 2'b01: Lock value will be sampled 16 times and averaged. 2'b10: Lock value will be sampled 8 times and averaged. 2'b11: Lock value will be sampled 64 times and averaged.
23	RW	0x1	freq_offset_en Frequency offset calculation enable. When enabled, PHY calculates the required offset based on the frequency information to get more margins at the lower frequencies. It should be set to 1'b0 if DLL is off because the frequency compensation offset will be calculated using the current DLL lock value. Frequency offset will be applied to write DQ/DM and read DQS. 1'b1: Enable frequency offset calculation. 1'b0: Disable frequency offset calculation.
22	RW	0x0	cal_vtc_en VT compensation enable. DLL delay is updated depending on the latest master DLL lock value whenever "dfi_ctrlupd_req" or "dfi_phyupd_req" is issued if cal_vtc_en=1. It compensates On-chip VT variation. 1'b1: VT compensation enabled. 1'b0: VT compensation disabled.
21	RW	0x0	ca_swap_mode_dis CA swap disable for LPDDR4 HW CAL CBT mode
20	RW	0x1	wck_vtc_en VT compensation enable for WCK. DLL delay is updated depending on the latest master DLL lock value whenever "dfi_ctrlupd_req" or "dfi_phyupd_req" is issued if wck_vtc_en=1. It compensates On-chip VT variation. 1'b1: VT compensation enabled. 1'b0: VT compensation disabled. cal_vtc_en should be 1 for use wck_vtc_en = 1.
19	RO	0x0	reserved
18	RW	0x1	rdtrn_dbi_cal_en DBI enable for LPDDR4/5 read training. 1'b0: DBI is not calibrated during read training. 1'b1: DBI is calibrated during read training.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
17	RW	0x1	wrtrn_dbi_cal_en DBI enable for LPDDR4/5 write training. Set to 0 if data mask, write DBI and read DBI are all disabled at DRAM. Otherwise, it should be set to 1. 1'b0: DBI is not calibrated during write training. 1'b1: DBI is calibrated during write training.
16	RO	0x0	wrlvl_resp Response after write levelling is done.
15	RW	0x0	LP5_16bank_mode LP5 16bank mode 1'b1: 16bank mode 1'b0: 4bg/4bank mode 8 bank mode don't care about this field.
14:13	RW	0x0	ctrl_upd_interval DLL update interval. DLL update is done periodically with interval defined by ctrl_upd_interval when ctrl_upd_time = 2'b10. 2'b00: 2us 2'b01: 4us 2'b10: 6us 2'b11: 8us
12:11	RW	0x0	lock_sample_condition Lock value sampling condition setting for lock value averaging. Applied when lock_averge_en = 1. 2'b00: Lock value will be sampled if ctrl_flock = 1. 2'b01: Lock value will be sampled if ctrl_clock = 1. 2'b10: Lock value will be sampled if ctrl_locked = 1.
10:9	RW	0x3	wrtrn_dqs_edge_en DQS edge enable for initial write training. This field can be changed to find the effect of duty cycle error on the initial write training result for debug purpose. For normal operation, use the default value (2'b11). 2'b11: DQ/DM captured at the rising and falling edge of DQS will be used for the initial write training (Default). 2'b01: DQ/DM captured only at the rising edge of DQS will be used for the initial write training. 2'b10: DQ/DM captured only at the falling edge of DQS will be used for the initial write training. 2'b00: Do not use.
8	RW	0x0	wrlvl_start Write levelling start. It can be enabled when wrlvl_mode = 1. It should be disabled after write levelling response (wrlvl_resp) is asserted.
7:6	RW	0x3	rdlvl_dqs_edge_en DQS edge enable for initial read training. This field can be changed to find the effect of duty cycle error on the initial read training result for debug purpose. For normal operation, use the default value (2'b11). 2'b11: DQ/DM captured at the rising and falling edge of DQS will be used for the initial read training (Default). 2'b01: DQ/DM captured only at the rising edge of DQS will be used for the initial read training. 2'b10: DQ/DM captured only at the falling edge of DQS will be used for the initial read training. 2'b00: Do not use.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
5	RW	0x0	wr_cal_mode If it is enabled, PHY will use "SDLL Code" which is calculated during write training. If disabled, PHY will use "SDLL Code" which is calculated from master DLL (T/4).
4	RW	0x0	lock_average_en Lock value average enable. If enabled, moving average will be applied to DLL lock value to remove lock value deviation due to power noise. 1'b0: DLL lock value will not be averaged (Default). 1'b1: DLL lock value will be sampled and averaged. The number of lock value that will be averaged is defined in avg_window_size.
3	RW	0x0	rd_cal_mode When rd_cal_mode=1, PHY will use "SDLL Code" which is calculated during read training. If disabled, PHY will use "SDLL Code" which is calculated from master DLL (T/4).
2	RW	0x0	ca_cal_mode CBT mode enable. For LPDDR4, if ca_cal_mode = 1 and cbt_vref_dqs_en[N] = 1, DQS/DQ/DM pad for Byte N will be set to driver mode. For LPDDR5, if ca_cal_mode = 1 and cbt_bit_dq_en[n] = 0, DQ pad for bit n will be set to driver mode.
1	RW	0x0	gate_cal_mode Gate training mode enable. If Gate training is used, this value should be high during operation. 1'b1: PHY will apply Gate cycle/offset result (GT_VWMC*_cs0/cs1 and GT_CYC*_cs0/cs1) from Gate training to gate signal. 1'b0: PHY will apply ctrl_shiftc to gate signal.
0	RW	0x0	wrlvl_mode Write levelling Mode Enable. If write levelling is configured (wrlvl_mode = 1), DQ/DM pad will be set to receiver mode (io_dq_en=16'hFFFF, io_dm_en=2'b11) and DQS pad will be set to driver mode (io_pdqs_en=2'b00, io_ndqs_en=2'b00).

DDRPHY_CAL_CON1

Address: **Operational Base** + offset (0x0008)

Bit	Attr	Reset Value	Description
31:28	RW	0x2	wrtrn_pass_adj This field controls how many times Write should be operated well to determine if it goes into VWP (Valid Window Period) or not. For write training, PHY decides that DQ is in the valid window if data check passes *4 times consecutively. The valid range is 0x1~0xF 4'h1: PHY decides that DQ is in the valid window if data check passes 4 time. 4'h2: PHY decides that DQ is in the valid window if data check passes 8 times consecutively. 4'h3: PHY decides that DQ is in the valid window if data check passes 12 times consecutively. ..... 4'hE: PHY decides that DQ is in the valid window if data check passes 56 times consecutively. 4'hF: PHY decides that DQ is in the valid window if data check passes 60 times consecutively.
27	RW	0x0	dfi_error_en Dfi error enable

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
26:20	RW	0x01	rdlvl_incr_adj Initial training step size (default: 7'h1, fine step delay). It should be smaller than 7'b0F. This is valid only for write/read DQ calibration, gate training and write levelling. [26:25]=2'b00: The step value will be "rdlvl_incr_adj[4:0]". [26:25]=2'b01: The step value will be "T/4". [26:25]=2'b10: The step value will be "T/8". [26:25]=2'b11: The step value will be "T/64".
19:16	RW	0x4	rdlvl_pass_adj This field controls how many times "Read" should be operated well to determine if it goes into VWP (Valid Window Period) or not. 4'h1: PHY decides that DQS is in the valid window if data check passes 2 time. 4'h2: PHY decides that DQS is in the valid window if data check passes 4 times consecutively. 4'h3: PHY decides that DQS is in the valid window if data check passes 6 times consecutively. 4'h4: PHY decides that DQS is in the valid window if data check passes 8 times consecutively. 4'h5: PHY decides that DQS is in the valid window if data check passes 10 times consecutively. 4'h6: PHY decides that DQS is in the valid window if data check passes 12 times consecutively. 4'h7: PHY decides that DQS is in the valid window if data check passes 14 times consecutively. Others: Do not use.
15:14	RW	0x0	ctrl_rpost_opt LPDDR5 read post-amble toggle option. Refer to read post-amble description in DRAM spec. 2'b00: Read post-amble = 0.5tWCK static. 2'b01: Read post-amble = 2.5tWCK static. 2'b10: Read post-amble = 4.5tWCK static.
13:7	RW	0x40	glvl_periodic_incr_adj Periodic (or short) gate training step size. It should be smaller than 7'h1F. Default value is 7'b1000000 (T/4). [13:12]=2'b00: The step value will be "glvl_periodic_incr_adj[4:0]". [13:12]=2'b01: The step value will be "T/2". [13:12]=2'b10: The step value will be "T/4" (default). [13:12]=2'b11: The step value will be "T/8". [13:7]=7'h00: The step value will be "T/16".
6:0	RW	0x01	rdlvl_periodic_incr_adj Periodic (or short) training step size. It decides the step value of delay line to increase during periodic read and write training. It should be smaller than 7'b0F. Default value is 7'h40 (T/32). [6:5]=2'b00: The step value will be "rdlvl_periodic_incr_adj[4:0]". [6:5]=2'b01: The step value will be "T/16". [6:5]=2'b10: The step value will be "T/32" (default). [6:5]=2'b11: The step value will be "T/64".

DDRPHY_CAL_CON2

Address: **Operational Base** + offset (0x000C)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31	RW	0x0	ctrl_rpre_opt Read pre-amble toggle option. Refer to read pre-amble description in DRAM spec. For LPDDR4: 1'b1: Read pre-amble = 2nCK toggle 1'b0: Read pre-amble = 2nCK static For LPDDR5: 1'b1: Read pre-amble = 2tWCK static + 2tWCK toggle 1'b0: Read pre-amble = 2tWCK static
30	RW	0x1	ctrl_rodt_disable Read ODT (On-Die-Termination) disable signal 1'b1: Read ODT disabled. Drive ctrl_read_p* to 0. If using LPDDR4, ctrl_read_p* will be always 0 by enabling this field (io_pdqs_read, io_ndqs_read, io_dq_read, io_dm_read are low). 1'b0: Read ODT enabled. Drive ctrl_read_p* normally (io_pdqs_read, io_ndqs_read, io_dq_read, io_dm_read are high only for read duration).
29	RW	0x0	ctrl_shgate This field controls the gate control signal 1'b0: Gate signal length = "burst length / 2" + N (Apply when DQS Pull-Down is enabled. N is determined by ctrl_gateduradj.) 1'b1: Gate signal length = "burst length / 2" ? 1 For LPDDR4, MR1 should be programmed so that read pre-amble is 2nCK static and read post-amble is 0.5tCK when shgate is 1'b0.
28	RW	0x0	ctrl_gt_fine_disable Gate fine training enable for periodic gate training
27:24	RW	0x2	ctrl_gateduradj It adjusts the duration cycle of "ctrl_gate" on a clock cycle base. MSB (bit3) controls direction: 1'b1: Subtract duration 1'b0: Add duration Bit[2:0] set duration value
23:20	RW	0x0	ctrl_gateadj It adjusts the enable time of "ctrl_gate" on a clock cycle base. The reference point is at the end of RL. MSB (bit3) controls direction: 1'b1: Subtract delay 1'b0: Add delay Bit[2:0] set delay value. When gate training is enabled, it configures the start point of gate training. If gate training is not enabled, it will be used to manually control the position of ctrl_gate.
19:16	RW	0x0	ctrl_readduradj It adjusts the duration cycle of "ctrl_read" on a clock cycle base. "ctrl_read" is the read odt control signal within PHY. MSB (bit3) controls direction: 1'b1: Subtract delay 1'b0: Add delay Bit[2:0] set delay value. It determines the high duration of io_pdqs_read, io_ndqs_read, io_dq_read and io_dm_read if ctrl_rodt_disable is 0.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
15:12	RW	0x1	ctrl_readadj It adjusts the enable time of "ctrl_read" on a clock cycle base. The reference point is at the end of RL. MSB (bit3) controls direction: 1'b1: Subtract delay 1'b0: Add delay Bit[2:0] set delay. It determines the start cycle of high duration of io_pdqs_read, io_ndqs_read, io_dq_read and io_dm_read if ctrl_rodt_disable is 0.
11	RW	0x0	ctrl_readduradj_ext Default value is 0. This field is used for extend control range of ctrl_readduradj value. ctrl_readduradj_ext = 1'b0 (default) => Non Extended ctrl_readduradj_ext = 1'b1 => ctrl_readduradj[2:0] + 'h8
10	RW	0x0	ctrl_readadj_ext Default value is 0. This field is used for extend control range of ctrl_readadj value. ctrl_readadj_ext = 1'b0 (default) => Non Extended ctrl_readadj_ext = 1'b1 => ctrl_readadj[2:0] + 'h8
9:8	RW	0x3	ctrl_maskdur_adj Single-ended NDQS input glitch masking duration adjustment during read ODT enable timing. 2'b11 (default): SE NDQS Glitch 3.5tCK masking 2'b10: SE NDQS Glitch 4.5tCK masking 2'b00: SE NDQS Glitch 5.5tCK masking
7	RW	0x0	ctrl_long_gate_train_mode Gate training mode by long gate (shgate = 0)
6:4	RW	0x0	glvl_start_adj Gate training start point adjustment. This field adjusts the initial code provided to the gate delay line at the beginning of periodic gate training. [6:4]=3'b000: The start point code is -T from the first DQS rising edge. [6:4]=3'b001: The start point code is -7T/8 from the first DQS rising edge. [6:4]=3'b010: The start point code is -6T/8 from the first DQS rising edge. [6:4]=3'b011: The start point code is -5T/8 from the first DQS rising edge. [6:4]=3'b100: The start point code is -4T/8 from the first DQS rising edge. [6:4]=3'b101: The start point code is -3T/8 from the first DQS rising edge. 25	RO	0x0	resync_done_flag_ds0 This field can identify resync is applied for DataPHY0. 1'b1: Resync is applied. 1'b0: Resync is not applied.
24	RW	0x0	ctrl_resync Active rising edge signal. User should set this signal low after setting high for normal operation. When this bit transits from low to high, pointers of FIFO within PHY and all of the DLL information (Read/Write/CA/CS DLL) is updated. If PHY is set to PHY-initiated updated mode, dfi_phyupd_req/dfi_phyupd_ack handshake should occur after ctrl_resync transits from low to high. If PHY is set to MC-initiated update mode, FIFO reset and DLL update will progress without a handshake after ctrl_resync transits from low to high. In general, this bit should be set only during initialization and refresh cycles. NOTE: Invalid command that are not listed in JEDEC command truth table could be interpreted as Read command and it will lead to FIFO/gate signal corruption. For example, vendor specific TMRS is reported to be causing this issue. Please toggle ctrl_resync after sending TMRS so that FIFO and gate signal can be restored.

DDRPHY_CAL_CON5

Address: **Operational Base** + offset (0x0160)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved
10	RW	0x0	binary_en This feature is TBD.
9:2	RW	0x00	wrtrn_cyc_th Write training cycle threshold. This is the minimum amount of delay line offset to determine cycle based delay on DQ/DM. For example, the first write training is completed with cycle = 1 and offset = 10 and wrtrn_cyc_th = 15. Because offset < wrtrn_cyc_th, PHY determines that cycle based delay should be reverted to 0, instead of 1. For the second write training cycle will be fixed to 0 and write training will progress increasing delay line code only. This is to guarantee the non-linearity cause by cycle delay not affect training result.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
1	RW	0x0	wrtrn_cyc_en Write training cycle delay enable. If enabled, cycle based latency will be used along with DQ/DM delay line (cycle delay = 0.5/1.0/1.5tCK). Enable this field for LPDDR4. It will reduce the VT calculation error caused by lock value variation as DQ/DM offset is reduced. Disable for other DRAM types.
0	RW	0x0	wrtrn_cyc_mode Cycle based write training mode 1'b0: Cycle code for left edge and right edge are matched. This improves accuracy in training result but with limited training range (1GHz or over). 1'b1: Cycle code for left edge and right edge are not matched. Use for low frequencies (500MHz~1GHz).

7.4.7 Internal Address Mapping For DFI Scramble

Please refer to DDR_GRF chapter for DFI Scramble registers description.

7.4.8 Internal Address Mapping For DDRMON

Slave address can be divided into different length for different usage, which is shown as follows.

Operational Base

Name	Base Address
DDRMON0	0x2A000000
DDRMON1	0x2A010000

7.4.9 Registers Summary For DDRMON

Name	Offset	Size	Reset Value	Description
DDRMON_IP_VERSION	0x0000	W	0x00000040	DDR Monitor IP Version
DDRMON_CTRL0	0x0004	W	0x00000008	DDR Monitor Control 0 Register
DDRMON_CTRL1	0x0008	W	0x00000000	DDR Monitor Control 1 Register
DDRMON_INT_STATUS0	0x000C	W	0x00000000	Interrupt Status 0
DDRMON_INT_STATUS1	0x0010	W	0x00000000	Interrupt Status 1
DDRMON_DDRC_IDLE_CNT_NUM	0x0014	W	0x00000000	DDRC IDLE Time
DDRMON_TIMER_COUNT	0x0018	W	0x00000000	The DFI Timer Threshold

Copyright © 2024 Rockchip Electronics Co., Ltd.

Name	Offset	Size	Reset Value	Description
DDRMON_FLOOR_NUMBER	0x001C	W	0x00000000	The Low Threshold In The Comparison of DDR Access
DDRMON_TOP_NUMBER	0x0020	W	0x00000000	The High Threshold In The Comparison of DDR Access
DDRMON_DFI_ACT_NUM	0x0024	W	0x00000000	DFI Active Command Number
DDRMON_DFI_ACT_WR_NUM	0x0028	W	0x00000000	DFI Write Command Number
DDRMON_DFI_ACT_RD_NUM	0x002C	W	0x00000000	DFI Read Command Number
DDRMON_COUNT_NUM	0x0030	W	0x00000000	Timer Count Number
DDRMON_DFI_ACCESS_NUM	0x0034	W	0x00000000	DFI Read And Write Command Number
DDRMON_TOP_LP_NUMBER	0x0038	W	0x00000000	The High Threshold In The Comparison Of DDR Cke Low
DDRMON_FLOOR_LP_NUMBER	0x003C	W	0x00000000	The Low Threshold In The Comparison Of DDR Cke Low
DDRMON_DFI_SREX_NUM	0x0040	W	0x00000000	Number Of DFI Self-refresh Cycles
DDRMON_DFI_PDEX_NUM	0x0044	W	0x00000000	Number Of DFI Power Down Cycles
DDRMON_DFI_CLKSTOP_NUM	0x0048	W	0x00000000	Number Of DFI Clkstop Cycles
DDRMON_DFI_SRPDEX_NUM	0x004C	W	0x00000000	Number Of DFI SRPD Cycles
DDRMON_DFI_DSMEX_NUM	0x0050	W	0x00000000	Number Of DFI DSM Cycles
DDRMON_DFI_LP_NUM	0x0054	W	0x00000000	Total Number DFI Low Power Cycles
DDRMON_DFI_PHY_LP_CTRL_NUM	0x0058	W	0x00000000	DFI PHY Low Power
DDRMON_DFI_PHY_LP_DATA_NUM	0x005C	W	0x00000000	DFI PHY Low Power
DDRMON_INT_MASK0	0x0060	W	0x0000FFFF	Interrupt Mask Control
DDRMON_INT_MASK1	0x0064	W	0x00000001	Interrupt Mask Control
DDRMON_INT_MASK2	0x0068	W	0x0000001F	Interrupt Mask Control
DDRMON_INT_MASK3	0x006C	W	0x0000001F	Interrupt Mask Control
DDRMON_CS_CONTROL	0x0070	W	0x00000002	Number of DDR Rank
DDRMON_PER_BANK_ACT_NUM	0x0100	W	0x00000000	Per-bank Active Number
DDRMON_PER_BANK_RD_NUM	0x0104	W	0x00000000	Per-bank Read Number
DDRMON_PER_BANK_WR_NUM	0x0108	W	0x00000000	Per-bank Write Number
DDRMON_PER_BANK_RD_WR_PER_ACT_MAX_NUM	0x010C	W	0x00000000	Per-bank Read-Write Per-Active Max Number

Copyright © 2024 Rockchip Electronics Co., Ltd.

Name	Offset	Size	Reset Value	Description
DDRMON_PER_BANK_SERIES_RD_BURST_MAX_NUM	0x0110	W	0x00000000	Per-bank Series Read Burst Max Number

7.4.10 Detail Registers Description For DDRMON

DDRMON_IP_VERSION

Address: **Operational Base** + offset (0x0000)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RO	0x40	ip_version DDR monitor IP version

DDRMON_CTRL0

Address: **Operational Base** + offset (0x0004)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	write_enable When bit 16=1, bit 0 can be written by software. When bit 16=0, bit 0 cannot be written by software. When bit 17=1, bit 1 can be written by software. When bit 17=0, bit 1 cannot be written by software. ..... When bit 31=1, bit 15 can be written by software. When bit 31=0, bit 15 cannot be written by software.
15	RW	0x0	ddr23_en ddr2 or ddr3 mode 1'b1: Enable 1'b0: Disable
14:11	RW	0x0	hot_bank Define which bank is currently monitored for per-bank statistics. For ddr3/lpddr3/lpddr4, bit[13:11] is used to support 8 bank. For ddr4, bit[14:13] is used for BG select, bit[12:11] is used for bank select.
10:9	RO	0x0	reserved
8:7	RW	0x0	hot_rank Define which rank is currently monitored for per-bank statistics. 2'b01: Rank 0 2'b10: Rank 1 Other value is not valid.
6	RW	0x0	external_trigger_en This register is used to enable multiple ddr monitors at the same time. If set to 1'b0, ddr monitor is enabled by software. If set to 1'b1, after enable all ddr monitors, an external trigger enable signal set to 1'b1 will start all ddr monitors. 1'b0: Disable 1'b1: Enable
5	RW	0x0	ddr4_en 1'b1: Enable 1'b0: Disable

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
4	RW	0x0	lpddr4_en 1'b1: Enable 1'b0: Disable
3	RW	0x1	hardware_en 1'b1: Enable 1'b0: Disable
2	RW	0x0	lpddr23_en 1'b1: Enable 1'b0: Disable
1	RW	0x0	software_en 1'b1: Enable 1'b0: Disable
0	RW	0x0	timer_cnt_en 1'b1: Enable 1'b0: Disable

DDRMON_CTRL1

Address: **Operational Base** + offset (0x0008)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2:1	RW	0x0	lpddr5_bank_mode 2'b00: BG mode 2'b01: 16 bank mode 2'b10: 8 bank mode
0	RW	0x0	lpddr5_en 1'b1: Enable 1'b0: Disable

DDRMON_INT_STATUS0

Address: **Operational Base** + offset (0x000C)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	W1C	0x0	over_int_srpdex This is the interrupt status of DDR SRPD over than high threshold. Only for LPDDR4/LPDDR5
15	W1C	0x0	bellow_int_srpdex This is the interrupt status of DDR SRPD less than low threshold. Only for LPDDR4/LPDDR5
14	W1C	0x0	over_int_dsmex This is the interrupt status of DDR deep sleep over than high threshold. Only for LPDDR5
13	W1C	0x0	bellow_int_dsmex This is the interrupt status of DDR deep sleep less than low threshold. Only for LPDDR5

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
12	W1C	0x0	over_int_phy_lp_ctrl This is the interrupt status of DDR low power ctrl interface over than high threshold.
11	W1C	0x0	bellow_int_phy_lp_ctrl This is the interrupt status of DDR low power ctrl interface less than low threshold.
10	W1C	0x0	over_int_phy_lp_data This is the interrupt status of DDR low power data interface over than high threshold.
9	W1C	0x0	below_int_phy_lp_data This is the interrupt status of DDR low power data interface less than low threshold.
8	W1C	0x0	over_int_clkstop This is the interrupt status of DDR clk stop number over than high threshold. Only valid for lpddr4/lpddr5.
7	W1C	0x0	below_int_clkstop This is the interrupt status of DDR clk stop number less than low threshold. Only valid for lpddr4/lpddr5.
6	W1C	0x0	over_int_pdex This is the interrupt status of DDR power down number over than high threshold.
5	W1C	0x0	below_int_pdex This is the interrupt status of DDR power down number less than low threshold.
4	W1C	0x0	compare_statistics This is the interrupt status to statistics the number of activate, write or read command and so on.
3	W1C	0x0	over_int_srex This is the interrupt status of DDR self refresh number over than high threshold.
2	W1C	0x0	below_int_srex This is the interrupt status of DDR self refresh number less than low threshold.
1	W1C	0x0	over_int This is the interrupt status of DDR read and write burst number over than high threshold.
0	W1C	0x0	below_int This is the interrupt status of DDR read and write burst number less than low threshold.

DDRMON_INT_STATUS1

Address: **Operational Base** + offset (0x0010)

Bit	Attr	Reset Value	Description
31:21	RO	0x000	reserved

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
20	W1C	0x0	port4_rd_addr_hit This is the DDRCTL's AXI port4 interrupt status read address hit the setting range.
19	W1C	0x0	port3_rd_addr_hit This is the DDRCTL's AXI port3 interrupt status read address hit the setting range.
18	W1C	0x0	port2_rd_addr_hit This is the DDRCTL's AXI port2 interrupt status read address hit the setting range.
17	W1C	0x0	port1_rd_addr_hit This is the DDRCTL's AXI port1 interrupt status read address hit the setting range.
16	W1C	0x0	port0_rd_addr_hit This is the DDRCTL's AXI port0 interrupt status read address hit the setting range.
15:5	RO	0x000	reserved
4	W1C	0x0	port4_wr_addr_hit This is the DDRCTL's AXI port4 interrupt status write address hit the setting range.
3	W1C	0x0	port3_wr_addr_hit This is the DDRCTL's AXI port3 interrupt status write address hit the setting range.
2	W1C	0x0	port2_wr_addr_hit This is the DDRCTL's AXI port2 interrupt status write address hit the setting range.
1	W1C	0x0	port1_wr_addr_hit This is the DDRCTL's AXI port1 interrupt status write address hit the setting range.
0	W1C	0x0	port0_wr_addr_hit This is the DDRCTL's AXI port0 interrupt status write address hit the setting range.

DDRMON_DDRC_IDLE_CNT_NUM

Address: **Operational Base** + offset (0x0014)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	ddrc_idle_cnt_number The DDRC idle time, which is calculated by DFI clock.

DDRMON_TIMER_COUNT

Address: **Operational Base** + offset (0x0018)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	timer_count The timer counter threshold, the statistics of DDR access only be done when timer counter is less then this threshold in hardware mode, in OSC clock cycle.

Copyright © 2024 Rockchip Electronics Co., Ltd.

DDRMON_FLOOR_NUMBER

Address: **Operational Base** + offset (0x001C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	floor_number The low threshold in the comparison of DDR access.

DDRMON_TOP_NUMBER

Address: **Operational Base** + offset (0x0020)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	top_number The high threshold in the comparison of DDR access.

DDRMON_DFI_ACT_NUM

Address: **Operational Base** + offset (0x0024)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dfi_act_num DFI active command number in the statistics range.

DDRMON_DFI_ACT_WR_NUM

Address: **Operational Base** + offset (0x0028)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dfi_act_wr_num DFI write command number in the statistics range.

DDRMON_DFI_ACT_RD_NUM

Address: **Operational Base** + offset (0x002C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dfi_act_rd_num DFI read command number in the statistics range.

DDRMON_COUNT_NUM

Address: **Operational Base** + offset (0x0030)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	dfi_count_num The DFI counter number in the statistics range, in DFI clock cycle.

DDRMON_DFI_ACCESS_NUM

Address: **Operational Base** + offset (0x0034)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	dfi_access_num DFI read and write command number in the statistics range.

DDRMON_TOP_LP_NUMBER

Address: **Operational Base** + offset (0x0038)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	top_lp_number The high threshold in the comparison of DDR self-refresh, power down or clkstop.

DDRMON_FLOOR_LP_NUMBER

Address: **Operational Base** + offset (0x003C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	floor_lp_number The low threshold in the comparison of DDR self-refresh, power down or clkstop.

DDRMON_DFI_SREX_NUM

Address: **Operational Base** + offset (0x0040)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	dfi_srex_num DFI self-refresh number during cke low.

DDRMON_DFI_PDEX_NUM

Address: **Operational Base** + offset (0x0044)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	dfi_pdex_num DFI power down number during cke low.

DDRMON_DFI_CLKSTOP_NUM

Address: **Operational Base** + offset (0x0048)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	dfi_clkstop_num DFI clkstop number during cke low. Only valid for lpddr2/3/4.

DDRMON_DFI_SRPDEX_NUM

Address: **Operational Base** + offset (0x004C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	dfi_srpdex_num DFI SRPD number during cke low. Only valid for lpddr4/5.

DDRMON_DFI_DSMEX_NUM

Address: **Operational Base** + offset (0x0050)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	dfi_dsmex_num DFI Deep Sleep Mode number during cke low. Only valid for lpddr5.

DDRMON_DFI_LP_NUM

Address: **Operational Base** + offset (0x0054)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	dfi_lp_num The sum of DFI self-refresh, power down, clock stop, self-refresh-pd and dsm cycles.

DDRMON_DFI_PHY_LP_CTRL_NUM

Address: **Operational Base** + offset (0x0058)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dfi_phy_lp_ctrl_num Phy low power count number during the time both dfi_lp_ctrl_req and dfi_lp_ctrl_ack assert.

DDRMON_DFI_PHY_LP_DATA_NUM

Address: **Operational Base** + offset (0x005C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dfi_phy_lp_data_num Phy low power count number during the time both dfi_lp_data_req and dfi_lp_data_ack assert.

DDRMON_INT_MASK0

Address: **Operational Base** + offset (0x0060)

Bit	Attr	Reset Value	Description
31:16	WO	0x0000	write_enable When bit 16=1, bit 0 can be written by software. When bit 16=0, bit 0 cannot be written by software. When bit 17=1, bit 1 can be written by software. When bit 17=0, bit 1 cannot be written by software. ..... When bit 31=1, bit 15 can be written by software. When bit 31=0, bit 15 cannot be written by software.
15	RW	0x1	bellow_int_srpdex Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
14	RW	0x1	over_int_dsmex Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
13	RW	0x1	bellow_int_dsmex Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
12	RW	0x1	over_int_phy_lp_ctrl Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
11	RW	0x1	bellow_int_phy_lp_ctrl Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
10	RW	0x1	over_int_phy_lp_data_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
9	RW	0x1	below_int_phy_lp_data_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
8	RW	0x1	over_int_clkstop_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
7	RW	0x1	below_int_clkstop_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
6	RO	0x1	over_int_pdex_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
5	RO	0x1	below_int_pdex_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
4	RW	0x1	compare_statistics_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
3	RW	0x1	over_int_srex_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
2	RW	0x1	below_int_srex_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
1	RW	0x1	over_int_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
0	RW	0x1	below_int_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.

DDRMON_INT_MASK1

Address: **Operational Base** + offset (0x0064)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
17:16	WO	0x0	write_enable When bit 16=1, bit 0 can be written by software. When bit 16=0, bit 0 cannot be written by software. When bit 17=1, bit 1 can be written by software. When bit 17=0, bit 1 cannot be written by software. ..... When bit 31=1, bit 15 can be written by software. When bit 31=0, bit 15 cannot be written by software.
15:1	RO	0x0000	reserved
0	RW	0x1	over_int_srpdex Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.

DDRMON_INT_MASK2

Address: **Operational Base** + offset (0x0068)

Bit	Attr	Reset Value	Description
31:21	RO	0x000	reserved
20:16	WO	0x00	write_enable When bit 16=1, bit 0 can be written by software. When bit 16=0, bit 0 cannot be written by software. When bit 17=1, bit 1 can be written by software. When bit 17=0, bit 1 cannot be written by software. ..... When bit 31=1, bit 15 can be written by software. When bit 31=0, bit 15 cannot be written by software.
15:5	RO	0x000	reserved
4	RW	0x1	port4_wr_addr_hit_int_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
3	RW	0x1	port3_wr_addr_hit_int_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
2	RW	0x1	port2_wr_addr_hit_int_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
1	RW	0x1	port1_wr_addr_hit_int_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
0	RW	0x1	port0_wr_addr_hit_int_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.

DDRMON_INT_MASK3

Address: **Operational Base** + offset (0x006C)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:21	RO	0x000	reserved
20:16	WO	0x00	write_enable When bit 16=1, bit 0 can be written by software. When bit 16=0, bit 0 cannot be written by software. When bit 17=1, bit 1 can be written by software. When bit 17=0, bit 1 cannot be written by software. ..... When bit 31=1, bit 15 can be written by software. When bit 31=0, bit 15 cannot be written by software.
15:5	RO	0x000	reserved
4	RW	0x1	port4_rd_addr_hit_int_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
3	RW	0x1	port3_rd_addr_hit_int_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
2	RW	0x1	port2_rd_addr_hit_int_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
1	RW	0x1	port1_rd_addr_hit_int_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.
0	RW	0x1	port0_rd_addr_hit_int_mask Interrupt mask control, when bit set to 1'b1, the corresponding interrupt will disable.

DDRMON_CS_CONTROL

Address: **Operational Base** + offset (0x0070)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17:16	WO	0x0	write_enable When bit 16=1, bit 0 can be written by software. When bit 16=0, bit 0 cannot be written by software. When bit 17=1, bit 1 can be written by software. When bit 17=0, bit 1 cannot be written by software.
15:2	RO	0x0000	reserved
1:0	RW	0x2	rank_cs_num 2'b01: When there is 1-rank. 2'b10: When there is 2-rank. Other value is for 4-rank. Default 2'h2.

DDRMON_PER_BANK_ACT_NUM

Address: **Operational Base** + offset (0x0100)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	per_bank_act_number Active command number for per bank statistics

DDRMON_PER_BANK_RD_NUM

Address: **Operational Base** + offset (0x0104)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	per_bank_rd_number Read command number for per bank statistics

DDRMON_PER_BANK_WR_NUM

Address: **Operational Base** + offset (0x0108)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	per_bank_wr_number Write command number for per bank statistics

DDRMON_PER_BANK_RD_WR_PER_ACT_MAX_NUM

Address: **Operational Base** + offset (0x010C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	per_bank_rd_wr_per_act_max_number Per_bank_rd_wr_per_act_max_number number for per bank statistics. Count the max read or write command in every ACT to PRE period, for a designated bank.

DDRMON_PER_BANK_SERIES_RD_BURST_MAX_NUM

Address: **Operational Base** + offset (0x0110)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	per_bank_series_rd_burst_max_number per_bank_series_rd_burst_max_number number for per bank statistics. Count the max series read command in every ACT to PRE period, for a designated bank.

DDRMON_PER_BANK_SERIES_RD_BURST_TIMES_NUM

Address: **Operational Base** + offset (0x0114)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	per_bank_series_rd_burst_times_number per_bank_series_rd_burst_times_number number for per bank statistics. Count the total series read command in every ACT to PRE period, for a designated bank.

DDRMON_PER_BANK_SERIES_WR_BURST_MAX_NUM

Address: **Operational Base** + offset (0x0118)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	per_bank_series_wr_burst_max_number per_bank_series_wr_burst_max_number number for per bank statistics. Count the max series read command in every ACT to PRE period, for a designated bank.

DDRMON_PER_BANK_SERIES_WR_BURST_TIMES_NUM

Address: **Operational Base** + offset (0x011C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	per_bank_series_wr_burst_times_number per_bank_series_wr_burst_times_number number for per bank statistics. Count the total series write command in every ACT to PRE period, for a designated bank.

DDRMON_PER_BANK_RD2RD_PAGE_HIT_NUM

Address: **Operational Base** + offset (0x0120)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	per_rank_rd2rd_page_hit_number per_rank_rd2rd_page_hit_number for per bank statistics. Count every read to read page hit for designated bank. For example, for bank n. ACT-RD-RD-PRE, count as 1. ACT-RD-RD-RD-PRE, count as 2 and so on.

DDRMON_PER_BANK_WR2WR_PAGE_HIT_NUM

Address: **Operational Base** + offset (0x0124)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	per_rank_wr2wr_page_hit_number per_rank_wr2wr_page_hit_number for per bank statistics. Count every write to write page hit for designated bank. For example, for bank n. ACT-WR-WR-PRE, count as 1. ACT-WR-WR-WR-PRE, count as 2 and so on

DDRMON_PER_BANK_RD2WR_PAGE_HIT_NUM

Address: **Operational Base** + offset (0x0128)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	per_rank_rd2wr_page_hit_number per_rank_rd2wr_page_hit_number for per bank statistics. Count every read to write page hit for designated bank.

DDRMON_PER_BANK_WR2RD_PAGE_HIT_NUM

Address: **Operational Base** + offset (0x012C)

Copyright © 2024 Rockchip Electronics Co., Ltd.

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	per_rank_wr2rd_page_hit_number per_rank_wr2rd_page_hit_number for per bank statistics. Count every write to read page hit for designated bank.

DDRMON_PER_BANK_RD2RD_PAGE_MISS_NUM

Address: **Operational Base** + offset (0x0130)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	per_rank_rd2rd_page_miss_number per_rank_rd2rd_page_miss_number for per bank statistics. Count each RD-PRE-ACT-RD pattern for designated bank.

DDRMON_PER_BANK_WR2WR_PAGE_MISS_NUM

Address: **Operational Base** + offset (0x0134)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	per_rank_wr2wr_page_miss_number per_rank_wr2wr_page_miss_number for per bank statistics. Count each WR-PRE-ACT-WR pattern for designated bank.

DDRMON_PER_BANK_RD2WR_PAGE_MISS_NUM

Address: **Operational Base** + offset (0x0138)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	per_rank_rd2wr_page_miss_number per_rank_rd2wr_page_miss_number for per bank statistics. Count each RD-PRE-ACT-WR pattern for designated bank.

DDRMON_PER_BANK_WR2RD_PAGE_MISS_NUM

Address: **Operational Base** + offset (0x013C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	per_rank_wr2rd_page_miss_number per_rank_wr2rd_page_miss_number for per bank statistics. Count each WR-PRE-ACT-RD pattern for designated bank.

DDRMON_ALL_BANK_ACT_NUM

Address: **Operational Base** + offset (0x0140)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	dfi_act_num DFI active command number in the statistics range.

DDRMON_ALL_BANK_WR_NUM

Address: **Operational Base** + offset (0x0144)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	dfi_wr_num DFI write command number in the statistics range.
